TAYLOR & JONES
STALLIONS

If in the market for a good draft stallion, you can find a large number to select from in our recent importation

Percherons, Belgians and Shires

All for sale at reasonable prices and terms. Send for literature.

Williamsville, Sangamon County, Illinois

12 miles north of Springfield on Electric line.

Trumans' Champion Stud

1878 - 1912

The World's Greatest Collection of

SHIRE STALLIONS AND MARES

PERCHERONS TO SUIT THE MOST CRITICAL BUYERS.
HACKNEYS OF RICHEST BREEDING AND STRONGEST INDIVIDUALITY.

Champions of Iowa, Minnesota, Wisconsin, New York and Illinois State Fairs this year. Our prices are the lowest. Our Horses are the Best. Send for our handsomely illustrated catalog. Mention The American Breeder when writing. Eighth importation for 1911 arrived Nov. 17.

TRUMANS' PIONEER STUD FARM, BUSHNELL, ILL.

THE LARGEST IMPORTATION OF PERCHERONS IN 1911

J. OMER SINGMASTER & SON

KEOTA, KEOKUK COUNTY, IOWA

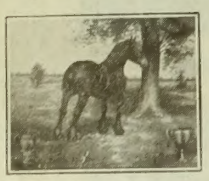
127 HEAD—AUGUST 28, 1911.

These stallions with our reserve stallions will soon be in proper condition to sell, not hog fat, but in ideal breeding condition. These animals are held at reasonable prices and will soon find homes throughout the horse breeding districts. I brought over this year, with other prize winning animals, the two-year-old stallion, Jalop (85614), a gray of great promise, from Aug. Tascheau breeding barns. I have 2, 3 and 4-year-old imported stallions at live and let live prices. See them.

Write me and your letter will be answered the day it is received. My barns are in town, one block east of depot. This stock is for sale and will be sold.

Keota is in Keokuk county, 100 miles S. E. of Des Moines, on the Wash. & Knox branch of the Rock Island railway.

CLEMENT MITEAU,
Barn Manager and Salesman.



J. O. SINGMASTER & SON

IMPORTED PERCHERON STALLIONS

At the 1911 Shows we won Championship on both Percheron and Shire Stallions, at the American Royal, the Inter-State and the Missouri State Fairs. All our horses are Imported. We sell as low as anyone on earth, quality considered. Our Guarantee and Insurance are the best known.

All street cars going south from Union Depot pass our barns.

PERCHERON IMPORTING CO., So. St. Joseph, Mo.

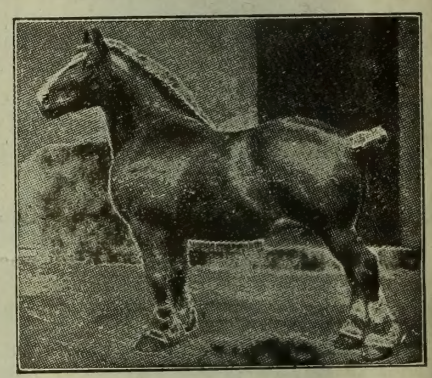
My November Importation Percherons, Shires, Belgians

Are in fine shape. I have 2-year-olds weighing a ton; 3-year-olds and over, 1900 to 2300 lbs.; sound and right in every way, and suit the most critical buyers. Every horse is guaranteed as represented. A veterinarian's certificate and state license is furnished with every horse. Pedigrees are right. Send 10c for picture of horse parade.

WM. CROWNOVER, Hudson, Blackhawk County, Iowa.

Imported Royal Belgian Draft Stallions and Mares.

These, together with pure-bred, home-grown horses, make up a choice collection to select from. Look ot our winnings at American Royal, 1911: First in two-year-old class; first in three-year-olds; second in aged class, showing three horses.



Also, good young jacks; jacks are ready for service. Come to our barns before buying. Stock priced to sell. Write us; your letter answered the day it is received. Breeding barns in town on two railroads.

Blue Valley Stock Farm, W. H. Bayless, Prop., Blue Mound, Linn county, Kansas.

IMPORTED STALLIONS

PERCHERON, BELGIAN, OR GERMAN COACH

A large selection of the above named breed of excellent quality, at reasonable prices. Every horse leaving our barn is backed by a fair and square guarantee. Our twenty-seven years of continuous importing high-class stallions with a resident buyer in Europe enables us to meet all competition. If in the market for a stallion, write us. We can use bankable paper.

OLTMANNS BROS.

Box 87 - - - Watseka, Ill.

Leer, Germany; Nevada, Missouri; North Fort Worth, Texas

CLYDESDALES

Of excellent quality a specialty. Both imported, and our own raising, from imported stock. The largest selection of registered stock in the West. ¶ Send for our booklet giving photographs and descriptions,

John Leitch

Lafayette, Stark County, Illinois

L. R. WILEY

IMPORTER AND BREEDER OF

Percheron, Belgian and Shire

Stallions and Mares. 75 head for my customers to choose from.

All stock registered in books approved by the government.

If you are intending to buy either stallions or mares, it will pay you to write or come and see me. You will find no better bunch of horses anywhere to select from and I will sell them as cheap as any man in America. Write me for full particulars.

L. R. WILEY, Emporia, Lyon County, Kansas.

Remember, I give an absolute cash guarantee.

What's What In Horse Breeding

Prospects All Right for Producers of the Good Ones. Conditions That Affect the Business And How to Overcome the Unfavorable. Public's Duty to Introducers of Improving Blood.

IF everyone interested in raising horses could spend a few weeks visiting the leading horse markets where they are sold at auction to the highest bidder, much more attention would be given to the subject of breeding. The purchasing value is the standard. A great many breeders who start to raising horses do not give the matter of type and class enough thought. Too many breeders use the first sire that happens to be convenient, regardless of what the product will develop into. Little thought is given to the selection of the sire, as to whether a proper cross is being made or not.

Perhaps the future of horse values is the first thing one needs to feel sure about. The occasional farmer thinks that the horse market will not continue good. The great extremes which the horse market has experienced have been brought about by the effect of cheap pastures. Owing to the fact that about one-half of this great domain was an open paradise for producing horses cheap, it was at one time possible to overstock the market. The great extreme in this direction appeared in 1893, when horses were killed and considered as worthless as jack rabbits on the Western plains. The slaughter during that time was appalling. In fact the ranges were so completely cleared of all horse breeding stock, that these western states are now buying good horses from the corn belt. There are not enough of the good ones raised to supply their own demand. Meanwhile, the country has been settled to such an extent that it now costs money to pasture live stock of any kind, and the market has taken on a more settled appearance. The fluctuations in horse production have been more marked in the United States than in other countries. In Europe there is little fluctuation in the price of this stock at any time, and as this country becomes more settled the same conditions will be found here.

A particular feature that is retarding horse production is the great extent to which mules are being raised now. More than one-fourth of the mares that were bred in the United States last year were bred to jacks. More than one-half of the four millions of mules we have, have been produced in a very few years, and mule production is increasing every year. Every jack of any standing as a sire is being used to his full capacity.

But the most difficult problem the American breeder has to contend with is the fact that only about one mare out of every three bred, actually produces a living foal. This can be accounted for largely by our methods of standing stallions on the "stand and suck" plan. Every shy breeding mare, regardless of diseased conditions or anything else, is usually bred every three weeks without any restriction. Among these barren mares a large per cent are diseased. This disease is being transmitted from one mare to another by the stallions and jacks, which is multiplying the disease as rapidly as compound interest. We can learn much from the methods of European horse breeding. In all the old countries some cash is paid at the time of service, and usually the custom is to pay one-half cash when the mare is bred, and the balance the first of March if the mare is known to be in foal. This plan has kept the diseased condition in check, owing to the fact that the owners of barren mares usually know them to be such, and will not pay the cash at the time of service. This eliminates many of the diseased mares that would be otherwise bred.

We are not especially advocating a change in the plan of insuring colts to stand and suck, as that system has been so well established in this country that it will be difficult to change it. If the owners of good stallions would form an alliance to require the mare owners to pay a reasonable price at the time of service, many mare owners would patronize the cheap inferior horses, whose owners are usually willing to guarantee anything. All those interested in horse breeding must learn not to have diseased mares served by their stallions and jacks, if they are to secure a greater per cent of foals. If there are any who believe that infection from diseased mares cannot be conveyed to healthy mares through the act of serving, we can very readily prove to them that it can, if they will furnish us with one of their clean, healthy mares. We have carried on experiments to show that this can be done, and that it must be guarded against by all horse breeders.

There are perhaps more three and four-year-old mares and geldings working in the large cities than ever was known before. When these young horses are employed on the paved streets of the large cities it means that their usefulness will be greatly diminished. The young mares being taken from the farms simply means that much retarding of horse production.

So far as we know the horse and mule market will continue good for a great many years to come, but one of the principal things that all mare owners should learn is to select better sires and take better care of their mares. There is nothing more profitable on the farm than a few good brood mares, as they can be used at the regular farm work and produce a good value in colts every year, and if properly handled, the colts can be nearly all profit. Among the average small farmers, three or four real good colts every year will make more profit than their owner will make out of the balance of his farm work, on an average period of ten years. Four colts at weaning time should be worth at least $400, and in ten years' time this would be $4,000. How many of the small farmers make more than that out of all their operations, unless they have made it in the increase in value of land?

A SPAN OF WESTERN RAISED REGISTERED PERCHERON MARES THAT HAVE BEEN RECEIVING CARE IN KEEPING WITH THEIR VALUE.

And looking at it from the stallioner's standpoint, if the small farmer could break even on all his other operations, and be sure of four good colts every year, which would be the profit of his farming operations, and know that he must depend on those mares producing that number of colts, and that these colts must be good, he would only use the best sires to be found, and he would take good care of his mares and colts. If the average farmer would think about this he would pay more attention to these particular subjects. There is just as much difference in horses as there are in other animals, and the value is measured in dollars and cents. If an inferior sire is used one can only expect to produce cheap colts, that will not any more than pay for the cost of production.

It is good live stock, and only good live stock, that makes the profit. In the production of all kinds of live stock there is a certain expense. If the produce will not any more than pay for its production no one is benefitted by such breeding. With all the scientific lectures that have been delivered from Agricultural Colleges, Experiment Stations, Farmers' Institutes and the occasional live stocg press, it is a surprise to any progressive horse breeder to know that two-thirds of the mares in this great, intelligent country are now being bred to mongrels and scrubs that should have been castrated. Mr. Mare Owner, what will you breed your mares to next year? The question is not what you have done, but do you intend to lower the quality of the live stock in your community by breeding your females of any kind to a scrub? Are you a public spirited citizen or do you belong to that class that believes any sire is good enough? The quality and value of all live stock is increased largely by the use of better sires. One good stallion in a community can do more good for the horse breeders in that vicinity in one year than can all the inferior sires, admitting that the are really useful at all.

Occasionally a good sire can be found among those not registered in a recognized live stock association, but when one of these is found, there are several top crosses of registered, excellent ancestors, close up in his breeding. If a grade is made better by having several top crosses from registered ancestors, why not patronize a full fledged registered animal? A register certificate means that the animal in question has a certain required number of registered ancestors. Everyone interested in improved live stock should encourage the Live Stock Registry Associations. An animal having registered ancestors all of a particular breed will be more likely to produce young of a uniform character, reproducing himself, than one having mixed blood. For instance, if a stallion was sired by a thoroughbred running horse, and the dam was an English Shire, about one-half of his colts should have the characteristics of one or the other of these parents, were he used on a band of average mares. It would be guess work to know whether the product would be Thoroughbred or Shire. If the mares were of hot blood there might be more of them would show the Thoroughbred conformation, but should the mares be of the draft type, then one would expect more of the Shire characteristics brought out

The average mare owner breeds less than six mares a year in this country. He cannot be expected to be posted on horse types as well as some of the experts, as the time is mostly occupied with other work. He, therefore, leaves it to his acquaintances among the owners of stallions and jacks as to the proper cross that should be

made in order to produce the kind of stock that will bring the most money on the market. This particular subject should be studied more closely by all interested in horse breeding. Horses should be bred for profit, and no mare should ever be bred with the expectation of producing offspring that will only pay the expense of raising it. But every mare should be bred with the expectation of producing a colt that will sell for more than the cost of its production. Such animals pay the profit, and the inferior sorts are the ones that lose you money.

In every locality there are a few public spirited men who show more than a passing interest in good stock—they buy and keep high class breeding stock in service. Their influence, and efforts, if appreciated, can work a great improvement. A word from one of these men to a brother breeder often causes him to breed his mares to better sires and he makes more money. These public spirited men often are the main factors in giving a community a reputation for good stock. In all such cases everyone interested in their class of stock, should not only patronize their stables, but should work to get others to do likewise. This is a practical method by which better stock can be had, and it is the duty of every mare owner in a community to appoint himself a committee of one to get business for the best sires.

MISSOURI "FARMERS' WEEK."

Owing to the extreme cold weather the attendance at Missouri's "Farmers' Week" meetings at Columbia was not as large as was expected. However, a great many progressive farmers and breeders availed themselves of the opportunity to make the most of the lectures and demonstrations on farming and live stock subjects. With favorable weather the town could hardly have cared for the crowds.

Those in charge of this work deserve much credit for their management and untiring efforts. A great many associations held meetings during the four days from the 8th to the 12th, inclusive. Among these were the Missouri Draft Horse Breeders' Association, the Missouri Saddle Horse Breeders' Association, Improved Live Stock Breeders' Association and at least a dozen other associations. This was one of the largest series of meetings of live stock and farmers' associations ever held in the state, and it was frequently observed that the state of Missouri is preparing to make great strides in improved methods of live stock production.

AVOIDING INJURY FROM WRONG ENTRY.

The American Breeder of December 20 says a Texas jack man is sued for damages to a mare by his jack making wrong entrance. I think if he had known enough to keep still and let the jack finish and come off in his own time and own way no evil would have resulted. I have known two accidents of this kind, one I had 30 years ago. An old stager put me wise when I began. I simply kept still. The mare owner did not know at the time that it was not a proper service. A neighbor had a like experience with a like result. Think this might be of use to beginners.—J. L. Mitchell, Polk county, Missouri.

MISSOURI BARS PUBLIC CUPS.

The Missouri state board of health, meeting with Governor Hadley and representatives of the leading railroads of the state, have decided upon abolishing the public drinking cups on railway trains and at stations. The railroads, it is stated, did not oppose the proposition and the board's order abolishing the cups on grounds of public health will be made a law by executive proclamation.

What of The Colt Crop?

Weather Extremes And Scarcity of Feed Are Obstacles to Satisfactory Production to be Overcome Only by the Most Rational Care.

There will be numerous disappointments in many localities this coming spring. The extreme heat of last summer caused many abortions. The scarcity of feed and the extremely cold winter will also add to the loss of foals. We want every mare owner to watch his mares closely during the next few weeks, and see that the mares have the best of care. The general physical condition of most mares in this country is very low at this period, and it is this condition that often creates a great loss to the mare owners.

If the mare should have a dull look in her eyes, and act stupid, her tail and vulva should be examined carefully to see if there is any blood to be found on these parts, also make a search for the fetus in the stall or wherever she may have been. In case a mare has lost her colt she should have good care and it is profitable to have a veterinarian thoroughly cleanse the genital organs with a disinfectant. This, however, should never be used at a lower temperature than 105 degrees. The mare should be separated from all other brood mares immediately, and all litter should be burned. Accidental and contagious abortion sometimes act very much alike, and no one should take any chances on contagious abortion, as it is a disorder very difficult to eradicate.

danger of conveying contagious abortion through the act of copulation, for several months after the mare has lost her fetus. The mare owners and the stallion owners must be honest with each other in order to secure the best results. They must work in harmony. Their interests are the same, and it will be profitable to all parties concerned to proceed on this basis.

Owing to the scarcity of feed all breeders of live stock should be careful about feeding mouldy or musty feed, as it nearly always has a serious effect on the digestive tract (which is in sympathy with the generative organs) and is liable to cause abortion. Any extremely laxative diet may also prove serious. A large quantity of ice cold water or frozen feed taken into the stomach at one time often affects the circulation to the extent that the digestive tract is seriously affected, and the same results can be expected. There is occasionally loss from brood mares having access to stalk fields, but this can usually be overcome by allowing them in for only a very short time at the beginning, each day gradually increasing the length of time. There is, however, some danger even under these conditions, but with the scarcity of feed, and the fresh air and exercise afforded by stalk fields, one can usually take the chance, by being very careful at the beginning.

TO THE MARE OWNERS.

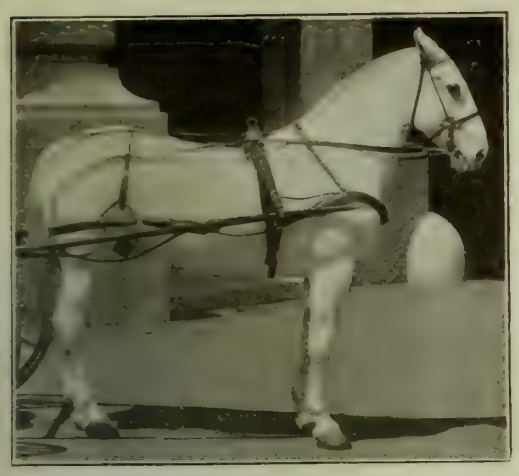
Hundreds of progressive stallion and jack owners have paid for the subscription of the American Breeder, to be sent to their mare owner friends until March 20. They have decided that the American Breeder is a good medium for breeders of live stock to read, and have encouraged their patrons to study these subjects with them. Where all receive their information from the same fountain head there should be harmony and good results. The subject of live stock breeding has been greatly neglected, and many fads and notions have been found useless and detrimental to foal production. There are so many new, up-to-date thoughts that all should study them thoroughly. These stallion and jack owners are, we believe, owners of good sires, or they would not encourage this paper to be circulated among their patrons, as they well know the attitude of this paper concerning better sires. We hope every mare owner receiving these paprs will consider the spirit in which it is being sent to them, and personally thank the breeder who has paid the subscription. The mare owner editions are regular editions, excepting they will be mailed a few days later than the regular subscriber's, owing to the length of time required to prepare them for mailing.

If the mare has not aborted, she may be suffering from an attack of influenza. The rectum temperature should be taken immediately, and if the temperature is above 102 degrees a veterinarian should be called. If the vulva seems too large, and the udder seems to be filling prematurely, it may be that the mare's system is in a condition which might cause her to abort. Frequently this can be averted by feeding the mare one-half ounce of fluid extract of black haw, once a day for several days. This is also a good treatment to remember in cases where a mare has lost one or more colts, and has become an habitual aborter. This treatment should be started about 30 days prior to the date the mare is likely to abort, which is at about the same period of pregnancy each time. As a rule mares known to be habitual aborters should be bred at a different time in the year; this may change the conditions which might have brought on the abortion at former periods. This ... results in many cases. It ... be so se... case of abortion, there is ... danger of al... mares on the farm (or all coming in contact with this mare) losing their colts also. This is a serious proposition. No mare owner should present a mare for service to a stallion or jack without first telling the owner of such an animal about the date the mare lost her foal. There is

On farms, horses are more easily kept in thrifty condition by being allowed on a pasture of some kind for a few hours each day. With the extremely high prices of all good feed, every owner of a horse should pay particular attention to a balanced ration, regular feeding, regular watering, and a good, substantial barn with plenty of ventilation near the ceiling. As a rule most farm horses eat too much hay, though this may not be the case this year. A small amount of grain at least twice a day at regular periods, and a reasonable hay ration with plenty of out-door exercise and a pasture of some kind where they will get a little roughness, will keep most farm horses in good condition. The kind and price of feed in certain localities must govern the kind of feed used in most cases.

The best way to regulate the feed is to watch the bowels. If the animal should show a ... position to looseness, ...tive diet, such as ...ld be diminished. ...le with caution ... of any live stock. All changes should be made gradually, as any serious change may upset the entire system, and even if an abortion does not result it will require more feed to get the animal back into its normal channel.

These weeks of cold weather have brought a condition which is very much out of the ordinary, owing to the thin condition of horses nearly everywhere. Go where you will, even through the country districts where feed is raised, and the horses are thin. As a result much attention must be given to mares especially during the next few weeks, to prepare them for farm work. They will be more easily hardened for work if allowed their freedom for several hours each day in a large enclosure, but it is best to have them tied in their stalls at meal time, to avoid possible kicking, as brood mares at this time of the year are frequently cross. Mares or geldings known to be kickers should never be loose with a band of horses. The proper place for an animal of this kind is in the city horse market or, if an extremely good one, it might be used on a feed wagon, or at some occupation where the opportunity would not be afforded to disable or injure horses. Occasionally one finds an excellent brood mare with a bad temper, but as a rule our best brood mares are of feminine character and are not usually extremely cross, although pregnancy has some effect over these dispositions.



There is one particular attention, in all horse breeding, that has great value, and that does not cost anything, which should be constantly observed. That is kindness. Its practice constitutes a valuable asset at any time. Horses, and all other live stock, which have no fear of their keeper, will live on nearly one-third less feed than those which are ready to climb right up in the hay rack every time the keeper comes about. They are always nervous and excited as if they expect to be whipped any time. All scientific men agree that the digestive organs do not perform their natural functions while in this state. If the animal is in a relaxed and perfect state of comfort in every respect, all the feed will be assimilated and every portion of it will give the animal the strength that nature intended it should. Not only that, but mares that are kept in fear of their master are always hardest to settle, and are not profitable as brood mares under these conditions. It is a pleasure to visit a farm where the live stock can be caught anywhere, and really like to be in the company of mankind. There are some animals, however, that have a wild disposition that require a great deal of careful handling.

During this season at least, the brood mares should not be at the disposal of the young men for riding or driving, as the mares which are used for conveyance to social affairs receive considerable disagreeable treatment, such as being allowed to stand for hours in the night with only the protection of a possible wire fence. Such mares cannot be expected to be profitable brood mares.

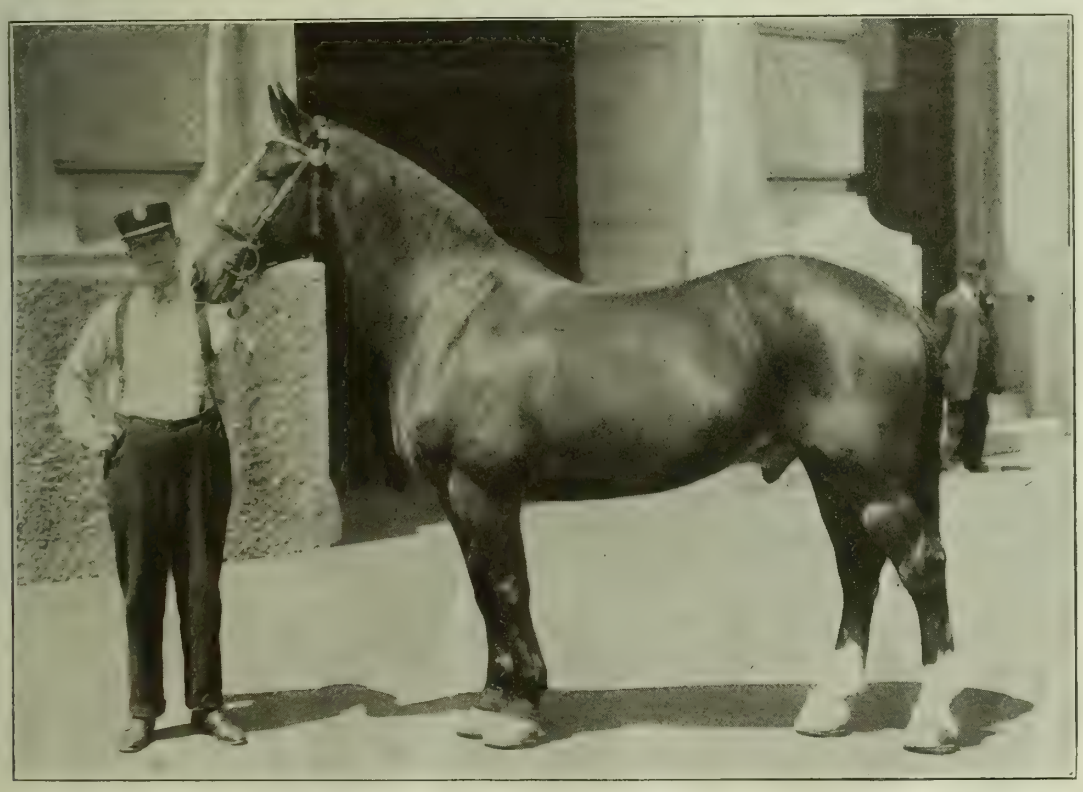
When we look at a strong young mare that is not producing foals, we wonder what mistreatment was the cause of her barrenness, for nature has equipped these females for production, except in a very few cases. When our readers study this question their minds will recall mares they have owned and they will think what caused these mares to be non-producers. This is the chief thought which this article was intended to inspire. If all breeders would ask themselves this one question, and then try to find out for themselves more about this subject, more and better horses could be produced without any additional cost.

EXPRESS RATES TO GO LOWER.

Our many readers who ship fine stock will be interested in the report from Washington saying that express charges throughout the United States are to be materially reduced by the interstate commerce commission. Hearings held by Commissioner Lane at New York and other places are said to have supported his previous opinion filed with the commission that rates were much too high.

A City's Fire Horses

Must Have Weight For Heavy Trucks, Action and Wind for Running, and a Good Head. Are Well Cared for and Last 12 to 14 Years.



No metropolitan city's equipment is complete without a good fire department, of which good fire horses are a very necessary part. Kansas City boasts of about 175 fire horses, Chicago has more than five times that number, while New York city counts its fire horses by the thousands.

One of the first requirements of a good fire horse is intelligence, for the animals in the service of a city's fire department must do more "head work" than the average work horses. They must learn to respond to fire alarms. All of the fire horses which pull the different apparatuses must possess not only weight and a good frame, but must be built for speed, for haste is absolutely necessary in fighting fires. The weights of fire horses vary, depending upon the apparatus they pull. The steam engine used by fire departments in the large cities weighs about seven and one-half tons. It is usually pulled by a three-horse hitch. Each horse belonging to this hitch must weigh from 1,550 to 1,700 pounds and be of good height. About the same specifications apply to the three-horse hitch which pulls the "hook and ladder" wagon. The hook and ladder wagon weighs 9,900 pounds, without any men. The hose wagon requires but two horses weighing about 1,500 pounds each. The "buggy" horse of a fire department is used for conveying the chief and his assistant to a fire. The weight of this animal must be between 1,250 and 1,300 pounds and the height 15 to 15½ hands. A horse for this purpose must be a good runner and active.

Usually the veterinarian of a city's fire department, or the chief, buys the horses needed for the service. After the animals are acquired in a market, the first thing that must be done is to train them to respond to alarms. It requires from two to six months to train a horse for the work, the length of time depending upon the intelligence of the animal. Sometimes the department finds it necessary to dispose of an animal because it cannot be taught to do the work properly. In the modern fire department stations the harness of the horses is kept hanging, so that after the animal gets under it and its collar is pulled it is hitched. The horses are kept behind the wagons, always wearing a bridle, fastened with a knock-out strap. When the fire alarm is sounded the trained fire horse breaks away from the knock-out strap and runs under the harness of the apparatus it pulls. The alacrity with which this is accomplished may be judged from the fact that the fast fire department teams are out of the barn running to the location of a fire in about sixteen seconds after the alarm is sounded, while in the middle of the night, when the firemen and horses are alseep it requires less than 18 seconds for the biggest apparatus with a three-horse hitch to get out of the station from the time the alarm is sounded. None of the old methods is employed in training the horses. They are simply led under a collar 12 to 13 times a day until they become familiar with the work required of them. Firemen who do the training say the best method is to be kind to the horses and talk gently to them. After being trained the horses are never changed from one apparatus to another,as they become accustomed to pulling the particular truck, its weight and its jars in making curves.

In the large cities fire horses receive unusually good care, and always present a fine appearance. The Kansas City department has regular periods for bedding down the horses, which are from 6:45 each evening to 5 each morning. It feeds the horses straight oats three times a day. Twice each week they are given a mixture of bran and oats stirred up well in warm water. For about forty-five minutes each morning after the bedding is removed the horses are carefully curried and brushed. After returning from each run to a fire they are rubbed down until dry and then walked a little, after which are returned to their stalls and watered. This watering after runs is in addition to the daily watering after each meal. Twice each year, in the spring and in the fall, the horses are clipped. In summer they are shod with shoes made with a rubber plate and a steel frame. Before these shoes are put on the bottom of the hoofs is packed with pine tar and okum, over which is placed a leather pad. This is done to keep the hoofs in good condition. The horses stand in board stalls. Some firemen pack their feet in mud occasionally to remove fever. In winter the horses are shod with plain iron shoes with sharp "corks." The hoofs are not padded during the winter.

There is in Kansas City an old fire horse, Dan, that is known all over the world, having been on exhibition in Paris and London. This horse served the fire department 26 years. There are a number of horses in the department that have been making runs to fires for over 14 years. Their average life after entering the work of the department is 12 to 14 years. It happens occasionally that the horses are not called out for several days in succession. During these periods they are taken out and given exercise to prevent their getting stiff. A few are lost each year through accident, which is not surprising in view of the fact that the horses must make fast runs almost daily over all kinds of slippery paved streets. The firemen who drive the horses always hold their heads tightly to minimize the chances for slipping.

ONE OF THREE THAT PULL THE SEVEN-TON ENGINE AT KANSAS CITY. HE HAS THE WEIGHT, THE WIND AND THE HEAD PIECE.

NEW OFFICERS FOR KANSAS STOCK BREEDERS.

The new officers of the Kansas Improved Stock Breeders' Association, elected at its recent annual meeting in Topeka, are as follows:

President, George B. Rass, Alden; vice president, H. W. McAfee, Topeka; secretary-treasurer, I. D. Graham, Topeka; directors, T. H. Terry, Bavaria; C. S. Nevius, Chiles; E. D. King, Burlington, Robert H. Hazlett, Eldorado; E. W. Rankin, Topeka.

The meeting was well attended considering the weather and the program was one of the best the members have ever enjoyed.

FOR THE KANSAS STALLION OWNERS.

To the American Breeder:—Another breeding season is near at hand and the attention of your readers who own stallions, is directed to the following requirements and provisions of the Kansas stallion law:

1st. No stallion can legally stand for public service in Kansas without a state license issued by the Live Stock Registry Board, and all advertisements of every kind or nature must contain a correct copy of this license (word for word).

2d. To procure a state license the owner must have the stallion examined for soundness by an authorized veterinarian. If any owner does not know who the authorized veterinarian for his district is, he should write to the secretary of the Live Stock Registry Board, at Manhattan, for this information. After the stallion has been examined for soundness, the owner must send to the Registry Board all pedigrees and other papers bearing upon the breeding of the stallion in question, or a certified copy of the same, together with a fee of $2 for issuing the state license, as provided by law.

3d. Section 6 reads as follows: "The owner of any stallion standing for public service in this state shall post and keep fixed, during the entire breeding season, copies of the license certificate of each stallion, issued under the provisions of this act, in a conspicuous place upon the main door leading into every stable or building where the said stallion stands for public service."

It is very important that this section be strictly adhered to that the mare owner may know what kind of a horse he is patronizing, both as to breeding and condition of soundness.

4th. Section 8 reads as follows: "Upon the transfer of ownership of any stallion enrolled under the provisions of this act, the certificate of enrollment may be transferred by the State Live Stock Registry Board upon submittal of satisfactory proof of such transfer and upon the payment of a fee of fifty cents."

Parties buying stallions that stood for public service in Kansas last year should have such transfer of ownership recorded in the books of the Registry Board, as required by law.

When such transfer of ownership is made the new owner should send to the Registry Board the old state license, and a new one will be issued in the name of the new owner. The law provides a fee of fifty cents for making such transfer

5th. Section 10 reads as follows: "Any stallion standing for public service that is not a pure-bred and registered horse must have conspicuously posted on the door of the stall in which he is kept, and in black type not less than one inch in height, a statement that such a stallion is a grade or a cross-bred, as the case may be."

Owners of grade stallions should bear this in mind and act accordingly.

6th. Stallions that have once been examined and licensed do not have to be re-examined and re-licensed again this year.

The spirit of the law is that every owner shall advertise his stallion for exactly what it is. Stallion owners have had time to familiarize themselves with the provisions of this law, and are expected to comply with the same.

The Registry Board is always ready and glad to render every possible assistance and service to the horsemen of Kansas.—Dr. C. W. McCampbell, Secretary Live Stock Registry Board, Manhattan, Kansas.

Opportunities of The Breeder

Some Examples From the Experience and Observations of the Author. The Factor of All-Year-Round Work in the Live Stock Business and Its Value to Any Community.

By W. S. Corsa, White Hall, Ill.

"THERE is a tide in the affairs of men that, taken at the flood, leads on to fortune." The great dramatist's definition of opportunity is of such universal application that it covers many a live stock story. One night, coming down from the north on the train with that eminent Shorthorn breeder, Frank Harding, he told me the story of his purchase of the famous White Hall Sultan. Upon arriving at Yellow Springs, the home of Mr. Kelly, the owner of Sultan, Mr. Harding went directly to the bull's stall. After walking around him and viewing him with that critical judgment and discrimination which every Shorthorn breeder knows is in the Harding blood and training, Mr. Harding provided himself with a more or less comfortable box and perched upon this. First from one corner and then from another, he watched in quiet and at great leisure every move and pose of the white bull. After several hours of watching and mental weighing, Mr. Harding returned to town, satisfied to Sultan's outstanding excellence; but still unwilling to pay the outstanding price and concluded to return home without making the purchase. While waiting for his train he happened to look over the hotel register and among the recent arrivals his eye fell on the name of another Shorthorn breeder whom it was known was in the market for an outstanding bull and well able to pay for him.

The full significance of this Shorthorn opportunity at once became apparent. Stepping to the telephone Mr. Harding accepted the bull and saved to Anoka Farms the profit, the honor and the glory of this matchless prize winner and sire of prize winners.

An opportunity lost to an individual but gained by the entire breeding fraternity was registered in 1907, a year that some of you may remember. This incident is a personal experience and I trust this audience will bear with me in its recital.

In that year the live stock breeding world suddenly lost one of its biggest hearted, most generous and enthusiastic members, Dr. Earles of Milwaukee. At that time Earles & Stanton owned the bull Cumberland's Last and some twenty of the choicest matrons of the Shorthorn breed. Most of them safely settled to his service. In spite of my inclination and Stanton's persuasive pleadings the outfit was passed up. This for a reason that might not appeal to any one dwelling in Kansas, but one of some force with us, viz: that in my inside pocket I did not have the few thousand ducats required.

The history of the show rings for the succeeding years has emphatically demonstrated some Shorthorn possibilities I have missed, and which might, indeed, never have been written had I accepted this golden opportunity in Shorthorn breeding. Congratulations are due all Shorthorn breeders in general and Charley Saunders in particular, for his foresight, courage and ability in taking this opportunity into camp.

In poetry and prose we have been told of the crimes committed in the name of Liberty. For generations past and in the days that now are, what crimes are committed in the name of feeding and breeding live stock?

A ride over these half-snow covered prairies in these opening days of the New Year would lead one to believe that some men to whom is given the ownership and care of live stock were satisfied that a balanced ration was made up of corn stalks, icicles, fresh air and exercise. When spring comes and the emaciated frames are doing their best to recover from the winter's ill treatment and necessarily with poor success, the owner charges it all up to the breed of stock and commits crime No. 2 by introducing some new breed into his herd.

The breed that meets our requirements and our fancy is the one to tie to. Having made this decision and started as nearly right as one's means and judgment permit, stay with it. Give it the best care, attention and development of which we are capable, learning from day to day those secrets of the art of the feeding and care—and the science of breeding. This course will lead somewhere while indiscriminate and frequent changing or crossing of breeds leads nowhere.

Men who profess to be live stock breeders are even more guilty. They should and do know better than to use a pedigreed scrub simply because of its illustrious family name. They should and do know better than to ignore the essential and substantial, in a meaningless struggle for fancy points. I yield to no one in admiration and appreciation of perfection of form and even the niceties of breed character and type.

But what matters it if the ear of a Poland China sow has the curve of a parabola or an eclipse, or the nose of a Berkshire tilts at 44½ degrees instead of 45. Men who profess to be live stock men, breeders of live stock, and do these things; who fail to provide for the living wants of their stock, who depend on indiscriminate mixing of breeds to relieve their troubles; who look no further than the pedigree and devote their time and attention to fancy points lack even the candor of the darkie who arose in an experience meeting and announced: "Brethren and sisters, I'se a right smart ornery nigger. I've played poker and I've shot craps. I've drank whiskey and I've stole chickens; but praise Gawd, I never yet lost my religion."

At the recent International, Mr. Geo. Lane, of Canada, offered $7,000 for the Grand Champion Percheron stallion and was refused. Mr. Lane, an ex-Kansas ranchman, and now owner of 50,000 acres of deeded land and 100,000 acres leased land, and so far as I know the owner of the largest band of registered Percherons in the world, having in the neighborhood of 400 registered mares, looked around and discovered that the sire of this Grand Champion Percheron stallion had been imported into this country and was located in Indiana, and straightway bought the stallion that could produce an International Grand Champion—an opportunity overlooked by every Percheron breeder except Mr. Lane.

If you will pardon another personal experience, I recall a visit from a Berkshire breeder looking for a Berkshire boar. He wanted something good and I turned him loose in a lot with three choice ones. My visitor spent some two hours viewing and reviewing the youngsters from every possible angle and finally made a selection. He left, however, a pig of truer type, one which later developed into Grand Championship material and sold for more money than any hog I ever sold at public or private sale, save one.

My friend Gentry tells a similar story. Years ago a visitor came to Wooddale looking for a boar. He finally narrowed the decision to one of two. Mr. Gentry, honestly giving his opinion and wishing to help his visitor in his selection, commented favorably on one of the two boars. Quick as a flash the visitor, pointing to the other pig, said: "I'll take that one." The boar which was rejected became one of the founders of Berkshire excellence, the famous Longfellow.

Opportunities for securing the progenitor of an illustrious family in a breed of live stock is one of the dazzling features of the enterprise. Waiting, watching, working may disclose such opportunity and may not. In the great army of live stock workers "he also serves who only stands and waits." So, whatever the direct results our work with live stock may be, one thing we quickly learn to recognize and prize beyond all else, the personal element—the associations and friendship, which are not merely incidental, they are inseparable from our work.

The work with live stock makes possible just such opportunities as these annual gatherings at the winter agricultural meetings. It is the introduction to lovely homes and honest firesides, enlarges the acquaintance among big and brainy people who do things worth the while—and what is worth while? The man who produces a calf with the broad, level top line instead of one fish-ribbed and having an elevated tail-piece has done something worth while. The man who produces the hog with the broad back and with the elevated tail setting has done something worth while. The man who feeds so as to produc two pounds a day where but one was made before, who so mixes his brain with his feed that two dollars produces as much as three did before, is an artist and is doing something worth while and that will compel recognition.

And here it may be stated that the development or acquirement of the feeder's art is one of the shining opportunities of breeding live stock. It is probably too general an observation to make to say that most good feeders are not constructive breeders. But in my limited observation I should say that most constructive breeders are good feeders.

From an economic point of view the perennial opportunity for employment afforded by live stock must receive notice. The opportunity to keep employed and to give employment throughout the year means much for one's self, the community and the state. It all makes for a more efficient organization, no new set of men to drill and train with each recurring year, your experience becomes their practice and the work moves with that machine-like precision which spells progress.

It has been charged to farmers more than to any other class of men that we do not recognize the value of time—exact time—we have all the season, at all events all the day. It is all the same whether we begin a certain task this morning or this afternoon, or tomorrow, or the day after tomorrow, so that we do not keep proper account of our activities. Through this indefiniteness for beginning and ending our work we lose time, perhaps only an hour or two. Even so:

"Lost: Yesterday, somewhere between sunrise and sundown two golden hours, each set with sixty diamond minutes. No reward is offered for they are lost forever."

An hour or two a month or two may be dropped into the irrecoverable past and lost without disastrous results to anyone. But is not the state's producing power immeasurably crippled and curtailed when any great proportion of its citizens drop out of producing activity for months at a time each year?

The farmer who embraces the opportunity afforded by live stock for year-round activity of himself and so many of his men as he can profitably employ is richer financially, healthier morally and physically and mentally and the state is better off.

The live stock opportunity is one that invites us to

"Do noble deeds, not dream them all day long,
And so make life, death and that vast forever
One grand, sweet song."

In my home state of Illinois there is a Pure Bred Sire Club. Anyone may become a member who pledges himself to use, wherever possible, a sire of pure breeding. The idea, with its germ of tremendous possibilities, is fairly infectious and large numbers are being added to the membership daily. It marks an advance position taken and held in the campaign for improved live stock and leads by a route both natural and attractive to those delightful planes of endeavor where pure bred live stock in all their attractive symetry of form claims our undivided attention.

If live stock affords additional opportunities to the farmer, and improved live stock greater opportunities through the organized use of pure bred sires, then the logical sequence, the natural conclusion, is to seize the opportunity afforded by the breeding and raising of pure bred live stock—not alone for our own satisfaction and profit, but for the welfare, the comfort and the profit of others as well as of ourselves.

"The wretch, concentered all in self,
Living, shall forfeit fair renown,
And, doubly dying, shall go down
To the vile dust from whence he sprung,
Unwept, unhonored and unsung."

The broad and general statement is ventured that no vocation so leads a man out of himself, so broadens his sympathies, so mellows his feeling for his fellow man, as breeding pure bred live stock; and no other peaceful vocation so fires his ambition and stimulates his courage.

In the recurring years we sow the grains in their season. In the live stock department the opportunity for seeding is daily and hourly.

"Sow a thought, you reap an act;
Sow an act, you reap a habit;
Sow a habit, you reap a character;
Sow a character, you reap a destiny."

"And in the field of destiny we reap as we have sown." There are doubtless many young men in this audience whose ambitions and aspirations are for pre-eminence in the noble professions of law and medicine. It may be then some young man's secret longing is to represent his district in the halls of the commonwealth. These are all commendable and laudable, but for me I should esteem it a higher honor, an index of greater skill, to have produced an animal form so perfect in its outline, so true to breed type, so full of excellence an merit that it would be accepted in public estimation as a pre-eminently worthy representative of its breed. Indeed, I would rather be the owner and breeder of an international grand champion than be the governor of the great commonwealth in which I have the honor and pleasure to reside.

The fact that a host of other live stock breeders throughout the length and breadth of our land cherish a similar ambition to a like degree, only enhances the honor, makes the delicate purple tints of the ribbon more radiant, more resplendant; for every glint and glimmer of its sheen speaks of satisfying toil and of obstacles overcome, of some approach to nature's truths, of some good work for man. It is the silent reminder of the transient thought of twilight harvested ofttimes only in experience in the duties of the

day. It is the inspiration of one successful act harvested from a heavy seeding of carefully cultivated endeavor. It is the bright and beaming harbinger of the fruition of coming years, remembering that "Duty and today are ours, results and futurity belong to God."

But the show ring is not only the court of last appeal upon a man's work, it is a sort of final verdict, a last analysis of the man himself. If there is in him envy or selfishness or bickering, then the show ring is the crucible to bring this dross to the surface. The show ring is a supreme opportunity to cultivate grace of spirit and of manner, generous impulse and mutual respect. Equal praise to the good loser and the modest winner.

"Who misses, or who wins the prize,
Go, lose or conquer as you can,
But if you fail, or if you rise,
Be each, pray God, a gentleman."

To be engaged in a business whose very foundation is honor, integrity and character, a business requiring every thought and care for its complete development, a business that thrives and flourishes in an atmosphere of generosity and kindly feeling and co-operation—does not this appeal to the heart and fire the imagination? A business that discounts Shakespeare's definition of opportunity, a business which believes there is more than one flood-tide in the waters of the ocean; a business that rejects the despair and desolation of one lost opportunity as defined by the incomparable Ingalls; but rather accepts that more hopeful, more joyous Opportunity which proclaims:

"They do me wrong who say I come no more,
When once I call and fail to find you in;
For every day I stand outside your door
And bid you wake and rise to fight and win."

The clarion call of such an opportunity with its cheer and its courage invites every man of ambition and aspiration to its standard. This standard will lead you into action and also it will lead into paths of pleasantness and into paths of peace. Van Dyke has set up some little guide posts on the foot-path to peace, a path always open and engaging to anyone interested in live stock.

"To be glad of Life, because it gives you the chance to Love and to Work and to Play and to look up at the stars; to be Satisfied with your possessions, but not Contented with yourself until you have made the best of them; to despise nothing in the world except Falsehood and Meanness, and to fear nothing except Cowardice; to be governed by your Admirations rather than by your Disgusts; to covet nothing that is your neighbor's except his Kindness of heart and Gentleness of Manners; to think seldom of your enemies, often of your friends, and every day of Christ; and to spend as much time as you can, with Body and Spirit in God's Out-of-Doors."

Editor's Note:—Mr. Corsa, whose skill with the "pen" may truly be said to be only less noteworthy than his skill with the Percheron and the "Berk," delivered the foregoing (which he has given us special permission to print) at the recent meeting of the Kansas State Board of Agriculture.

KANSAS HORSE BREEDERS ELECT.

The Kansas Horse Breeders Association at its recent annual meeting in Manhattan elected the following officers:

President H. W. Avery, Wakefield; vice presidents, Ralph Snyder, James Thompson, John Barr, E. H. Terry, John Bishop, Ralph McKinnie, George Ross. John Peck; secretary, Dr. C. W. McCampbell, Kansas Agricultural college; treasurer, H. N. Holdeman, Meade, Kas.

An amendment, passed at this meeting, provides that owners of pure bred mares and owners of stallions licensed by the state live stock registry board become members of the Kansas Horse Breeders' Association without dues.

The Horses of the Capitol

Mounts Which Carry the 320 Pounds of President Taft and Others of the Presidential and Cabinet Stables.

Written for the American Breeder By James E. Downing, Washington, D. C.

Political fortunes that make presidents and change cabinets do not appear to in any way lessen the popularity of the horse in Washington. Whatever may be their fate politically, the friends of the horse remain steadfast and true, for while men may come and men may go, the love for a good horse lives on forever. From the time of the first president on down to the present incumbent, the horse has been a popular institution at the capital of the nation. No fad or whim of fashion has supplanted him in the affections of the people, nor is there indication that horses will be less popular in the future. As a matter of fact, if any change in sentiment takes place it will be in his favor; wise heads are now planning a national horse show for Washington that will be international in its scope and the project promises for its patrons no less a person than President Taft. The capital's initial horse show was put on some months ago and pronounced as being equal to the best in the country. Invitations in the near future will be sent prominent horsemen throughout the country asking them to assist in making Washington the international horse show place of the country, where all may pay homage to his majesty, the horse.

Much has been said of the three saddlers President Taft keeps in Washington. Even when pressed with work the president finds time to indulge in horseback rides occasionally, say, once or twice a week, as he can find an opportunity. These short rides are usually taken on "Tate," his favorite saddler, a splendid animal six years of age and standing sixteen hands high. An unusually well formed body, powerful chest, clear eye, good feet, legs and wind, he takes his 320-pound master along without any difficulty and puts into his forward action all the spirit and vim of a good saddler. "Tate," named after his former owner, was purchased near Hot Springs, Virginia, and is the favorite of the three mounts owned by the president. Another of his horses is "Starlight," a big black of the same age and much the same gait as the favorite. He is sixteen and a half hands high, but shorter of body. He was secured at the army remount station in Oklahoma, but shortly after his arrival in Washington it was discovered that he was a forger, and the president has not ridden him as much as he otherwise would. "Greenbrier" is the name of the third saddler used by the president. He is seven years old, bright bay in color and stands sixteen and three-quarter hands high. He is coupled up short like Starlight—that is, short as compared to Tate, who is extra long in body. "Greenbrier" was raised near Hot Springs, the former home of Tate.

The former president had no use whatever for a "gasoline buggy" and made his feeling in the matter quite plain at different times, especially if he spied one before the White House door. His family shared his convictions along this line and employed horses altogether. President Taft, however, makes use of a large touring car to facilitate getting about in the city and to save time, but not because he loves a horse less. The secret-service men follow this car on motorcycles. His wife also rides in a car to discharge her social obligations, but Miss Helen, on the contrary, is an enthusiastic horsewoman.

Horseback riding with Miss Helen Taft amounts to almost a religion. Seldom a day goes by when at home and the weather permits, that she does not take a gallop. Her favorite route is through Rock Creek Park over the paths and roads her father travels on his rides, although she not infrequently accompanies friends on excursions through the adjacent country. Miss Taft has two saddle horses at her command, but they do not fill all of her riding engagements by any means. Indeed, it is quite the fashion for her personal friends, who are legion at the capital, to offer her one of their mounts for a ride. One of her riding horses is Achilles, a gaited Kentucky horse, 15 years old and fifteen hands high. For five years Sergeant McDermott rode this same horse trailing a former president who was something of a rider, and during his time the horse was given some good endurance tests. With all of his hard going of the past he conducts himself much like a three-year-old when he is taken out these days. The other riding horse and the favorite is a 4-year-old three-quarter thorough bred mare called "Lady Warren." This mare and Miss Taft are quite chummy; in fact they appear to understand each other pretty well in all matters. Out in Rock Creek Park there is a five-foot jump. Lady Warren knows all about it, even if "Papa Taft" does not. She has jumped it many's the time, and knows to a nicety just how to carry her slight, girlish rider over the top without touching and landing handily on the opposite side. There is never any argument about it, for each repetition carries with it some reward in either affection or sugar. Consequently a ride in the park generally means a jump, and one is as keen for it as the other, but this does not hold good with any other mount. Lady Warren is the only saddler intrusted with this important undertaking.

RIDING HORSES FROM THE STABLES OF PRESIDENT TAFT.

Owing to poor health since she has been a resident of the White House, Mrs. Taft has made no attempt to indulge in horseback riding. It is not because she does not like horses, but because her state of health will not permit. For that reason she employs an automobile, but her love for horses is well exemplified in her constant presence beside her husband in their box at the initial horse show held in Washington last month.

Major Archibald Willingham Degrafenreid Butt, personal aide to the president, rides a powerful bay horse nearly seventeen hands high, which he calls Billikin. He accompanies the president on all of his excursions, but the size of the two men is very much in contrast. The horse was secured from the army remount station in Oklahoma, is six years old and well gaited.

With but few exceptions the members of the president's cabinet are lovers of good horses, Secretary of the Navy Meyer especially. He is a most enthusiastic horseman, and so are the members of his family. His two daughters are very devoted to riding and are among the prominent society ladies who are seen on the bridle paths about the city. The secretary keeps a good stable, and recently added to it by the purchase of a saddler from Baltimore, for which he paid, so it is reported, $1,000. It was a present to one of his daughters.

Former Secretary of War Dickson was a regular rider while in Washington. Being a native of Tennessee, he never allowed his enthusiasm to wane. His daily life when in the city included a 6 o'clock morning ride on some of the well known bridle paths. While a member of the president's cabinet he maintained a good stable of riders and drivers.

Secretary of Agriculture Wilson drives a matched team of blaze-face sorrel horses which he purchased in the Blue Grass region adjacent to Lexington two years ago. They are seven and eight years of age and come from the Kentucky saddle stock which produces fine carriage horses. One of them was sired by Harrison Chief, Jr., and the other by Bracken Chief, both being sons of Harrison Chief. They have good style and action, and are over fifteen hands high. The secretary's carriage is familiar to many at the capital.

TWO STATE DRAFT HORSE MEETINGS.

New officers elected by the Ohio Percheron Horse Breeders' Association are: President, Prof. F. R. Marshall, Columbus; vice-president, C. M. Jones, Plain City; secretary-treasurer, G. F. Dix, Delaware.

The Iowa draft horse men organized at a meeting held in Ames, January 16, and elected to office the following: President, G. W. Grisby, Madrid; vice-president, C. B. Dannen, Melbourne; secretary, Howard Vaughn, Marion; treasurer, Martin Nelson, Cambridge. Directors, Frank Montgomery, Mt. Pleasant; Geo. McLoad, Belle Plaine; William Crownover, Hudson; E. W. Green, Castalia; Chas. Buck, Rhodes; A. L. Dutton, Keokuk; Charles Irvine, Ankeny; J. A. Bliss, Diagonal; Charles Summers, Malvern; A. W. Hawley, Pioneer; James B. McMillan, Rock Rapids; W. V. Hickson, Marengo; J. G. Scott, Cambridge; J. O. Singmaster, Keota, and G. W. Maxwell, Ames.

THE AMERICAN BREEDER

With which is combined
THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE
Editors.

Published semi-monthly (on the 5th and 20th of each month) by the
GRAHAM PUBLISHING COMPANY, INCORPORATED.
225 WEST TWELFTH STREET.
Kansas City, Mo.
BELL TELEPHONE, 4297 GRAND.

All communications for this paper should be addressed to the Graham Publishing Co., and not to any individual.

Advertising space for a single issue, $2.80 per column inch. For large space or longer time, rates furnished on application.

Subscription Rates.

To all points in the United States and Mexico, per annum, 50c; 3 years, $1, payable in advance.

To all points in Canada, per annum, in advance, 75c.

To all foreign points (in the International Postal Union), per annum, in advance (6 francs, 5 shillings), or $1.15.

When sending subscriptions, please state whether they are renewals or new ones. Always renew under the same name and initials as previously used, and at least two weeks before your present subscription expires, so that you will not miss any number. When changing your postoffice address, state the old address as well as the new one.

Watch the wrappers on your paper. The month before your subscription expires they are stamped "your subscription expires with next issue," and on the following edition is stamped "your subscription expires with this issue." When the time for which the AMERICAN BREEDER is ordered has expired, it is always discontinued.

If you miss your paper please notify us at once and all lost copies will be replaced.

Entered as second class matter, November 23, 1911, at the postoffice at Kansas City, Mo., under the act of March 3, 1879.

RENEW YOUR SUBSCRIPTION NOW.

A large number of subscriptions will expire with this issue. It is our custom to discontinue sending the paper at expiration of the subscription. We do not wish to force the paper on any one, and we have found this custom very satisfactory to all. The papers which have followed this custom, have some merit or they could not exist. We are very glad to say that most of our subscribers who do not renew their subscriptions have let their papers stop either because they quit the business or died. It is interesting to know that nearly all our subscribers for the first issue of the Stallion and Jack News, are still among our valued readers. We have tried hard to put up a good, intelligent, fearless publication.

We have never made it a practice, when subscriptions expire, to notify subscribers more than once. It would seem like a waste of time and money. But the serious problem is to supply back numbers to those who fail to renew at the proper time. We are now out of the three last issues. We always try to supply our readers with copies that they have missed. The best thing for every one to do is to renew a few weeks or even months before his subscription expires. This will insure each one of getting every paper without missing an issue. No time will be lost, as the renewal is always dated from the time of the expiration.

The growth the American Breeder is making means that for the next few weeks the subscription department will be crowded with work as it never has been before. If mistakes should be made at any time we will be glad to rectify them promptly upon notification. All horse men will receive just as much information and attention in the future issues as they have heretofore; and, in fact, we will be in position to serve them better in two papers a month than was formerly possible with one paper a month. There will occasionally be special editions on certain classes of live stock that will contain reading matter of great value and that will not likely be equaled anywhere else. These special editions are planned to be helpful to all our readers, who wish some special subjects fully discussed, as there will be articles of a similar kind all in one paper.

The change to a semi-monthly will require more expense, and the subscription will necessarily be increased to 75 cents a year in the near future, but all have the opportunity now to renew their subscriptions and get two big papers a month, for three years, all for $1. Three-fourths of our renewals are now coming in on this basis. For this, and for the steady increase in the number of new subscriptions received, we know for one thing, we can thank many readers who are telling their friends and neighbors where to get reliable information on breeding subjects. The American Breeder now goes to every state in the union, and to nine foreign countries.

THE ROYAL STAYS AND DOUBLES IN SIZE.

What appears to be the best possible settlement of the American Royal Live Stock Show question has been reached. After weeks of uncertainty, with a possibility that Kansas City would lose the show altogether (which would mean a loss to practically every one interested in improved live stock in Kansas City territory) the directors of "The Royal" are able to announce that the show will stay in Kansas City permanently, and will be doubled in size.

For this fortunate solution the officers of the American Royal, and the live stock interest they represent, can thank not only their own untiring effort, but equally the public spirit and enterprise shown by the Kansas City Stock Yards Company and the Kansas City Commercial Club. In fact it was largely through the combined efforts of the last named two institutions that a long time lease under favorable terms was secured on fifteen acres of ground adjoining the present site of the American Royal show. The Burlington railroad, which owns this property, turned down what was probably a better offer, financially, from the Union Depot and Terminal Railway Company in order to co-operate with the Stock Yards Company and the Commercial Club in keeping this essentially Kansas City institution here in Kansas City.

The Commercial Club has obligated itself to pay the rental and taxes on the fifteen acres secured from the Burlington railroad, and the Stock Yards Company has agreed to put up $100,000 worth of buildings on the ground. In addition to this the Stock Yards Company has agreed to maintain an entrance to the American Royal show near where the entrance has been heretofore, and by means of a viaduct increase the facilities for handling the crowd and do away with many of the disagreeable features connected with the former surface entrance. The Stock Yards Company has also agreed to give the American Royal people the free use every year of the present exposition buildings, but will be unable to vacate any longer the barns which housed the exhibits of cattle, horses, sheep and hogs. In fact it was the congestion at the stock yards which forced the company finally to withdraw the use of these buildings that put the American Royal "up in the air."

This final settlement in a permanent and satisfactory manner, of a question which seriously concerns all Kansas City business interests and the live stock interests of a vast territory of which Kansas City is the center, is of far more than passing importance. The show, once taken from Kansas City where it originated over a dozen years ago, would have been almost certain to lose the prestige it has gained, and might have dwindled to the proportion of a private enterprise. In the light of the new arrangement and of the development plans connected with the building of the new Union Depot in Kansas City, the permanent home decided upon seems better located than ever before. The taking away of a passenger traffic from the west bottoms will double the facilities for handling shipments intended for this show, and correspondingly decrease the delay in making delivery to the show barns. The new viaduct with which it is proposed to give Kansas City, Kas., direct connection with the new Union Depot, will pass right by the grounds, which will give uninterrupted street car service on overhead tracks in each direction.

The American Royal Live Stock Show is at present incorporated for $5,000. Of this stock $1,000 each is held by the following institutions: The American Shorthorn Cattle Breeders' Association, the American Hereford Cattle Breeders' Association, the Galloway Cattle Breeders' Association, the Aberdeen Angus Cattle Breeders' Association and the Kansas City Stock Yards Company. Whether or not the capital stock of the company is to be increased, and an opportunity given for the various other live stock associations to own stock in, and take part in this great show, has not yet been announced. The space has been provided and the facilities will be forthcoming for the greatest show of breeding animals in the world, and it is the earnest wish of everyone who desires the best influences for the breeding of improved live stock that the American Royal be made to include not only a large and strengthened show of heavy horses, jacks and mules, but also the greatest show of pure bred hogs on the continent. All this is possible if the right steps are taken.

The officers of the American Royal, in addition to being business men, are thorough going, all around stock men, who know the live stock interests of this territory and the stock show possibilities at this point, and if the various organizations not now included will, through their stockholders and officers, come to the American Royal people with propositions to participate in making the show what it ought to be, they can get hearings on the merits of their propositions.

THE VALUE OF BREEDING DAMS.

A few men have failed in live stock breeding, which may have been their own fault or a result of natural consequences, but the majority of men who have intelligently followed the breeding business have had more or less success. Just because a few men have failed is no reason that the entire industry should be censured.

We want our readers to give their experience regarding successful mares, jennets, cows, sows—that is, the best possible record that an animal has actually produced, and the products sold for actual cash. If an animal has produced a large number of young, the total sales of the products should be added up and the result given. We asked for articles on this subject last winter and received a number of good ones, and we hope our readers will favor us with other articles.

CAPSULE BREEDING.

The American Breeder and Stallion and Jack News, has been advocating the capsule method in horse breeding for several years, and it is only fair to our readers that we ask those who have been using this system successfully, to give their experinece. This is the best possible way of knowing what results are being obtained from actual experience by those in the field. The results obtained have been wonderful, considering the fact that unscrupulous dealers have advertised instruments with the "easy to use" instructions, which have caused many failures in artificial impregnation. We have taken up this campaign against these obstacles and have developed thousands of successful breeders who have doubled their income and greatly enhanced the value of many shy breeding mares in their community. We will be glad to have short letters from all our readers on this subject.

THE UNIVERSAL LIVE STOCK.

The hen is, in the fullest sense, an all round "farm critter." She belongs on every farm, and every village lot in the country. No matter what specialty the man of the family may have in the way of larger live stock, the hen belongs on the place, too—and the woman of the house is apt to see that she stays there. It is impossible, then, that a paper with the obligations toward its readers which the American Breeder has assumed, should ignore the hen. We are making a place for her and every issue henceforth will find her in her place. To begin with, we print next week, a full report of the first three months' progress in the National Egg Laying Contest, now being conducted at Mountain Grove, Mo. Here is the biggest thing yet undertaken in America, in the interest of an accurate, scientific test of the laying powers of breeds and individuals in chickens. It is the American Breeder's kind of "dope."

SCIENTIFIC BREEDING SCHOOL.

The next regular term of the Graham Scientific Breeding School will begin February 15 and end February 22. This will be the largest term of the school. Many of the students who have attended the former terms will be here, and give their experiences, which will be worth much to all new students. This is the only school of its kind, and its growth has been phenomenal. Students have traveled thousands of miles to attend, and all have expressed themselves favorably. The owner of a good stallion or jack can well afford to attend this school regardless of distance.

A BROADENED INTEREST.

Among the many evidences that our decision to gradually broaden the American Breeder into an all around live stock paper, was timely and right, is the frequent mention of various kinds of live stock in the letters that come to this office. Many horsemen's letter heads show that they breed pure bred cattle or hogs or poultry (often all three) as well as horses. A number of horse and jack advertisers mention cattle and hogs in their advertisements. Practically every reader will feel an interest in these advertisement mntioning other lines, and should let their interest be felt where convenient. Every American farm and home is the better for looking broadly upon this matter of domestic animals, and the old saying about putting all one's eggs in one basket applies to them as well as to any one in the world.

CO-OPERATION IN NEWS GIVING.

There are fifteen states having stallion registration laws, and a number of other states contemplating the passage of similar laws. We would be glad to hear from our readers concerning these or any other laws passed by their respective states affecting the breeding of live stock. Whether these laws are good or bad, all our readers wish to know about them.

This paper being national in its scope makes it difficult for us to locate immediately all of the important news of the country, and readers will be helping themselves and others as well as us by furnishing the American Breeder with all news of the business which comes to their attention. Our thanks are already due to many who have helped in this direction.

MARE OWNERS ARE SPEAKING FOR THEMSELVES.

To the American Breeder:—I have read in your paper that you were going to publish mare owner editions and requesting stallion and jack owners to pay for and send them to their customers. Now, there may be men who would not care to do this. You don't give the mare owners a chance to help themselves.

Now, I don't want to miss a single copy of the mare owner editions and I don't care to have my stallion owner pay all of the bills. He did me a great favor in the first place by sending me the Stallion and Jack News. Will you please quote me the price of your new edition, so that I can send for it myself? Now, it may seem strange to you that I want this information so badly and I own only one mare that brings colts, but I need this information as badly as though I owned a dozen. I believe that the American Breeder is the greatest publication on earth, and that it will do more good to the general stock man than all others combined.—Eugene Elliott, Latah county, Idaho.

To the American Breeder:—Inclosed please find 50 cents for which send me your paper for one year and oblige me. Bent Crist sent this paper to me for three months, last March, April and May, and I found it certainly very valuable to myself, as I am interested in good draft horses very much. Mr. Crist is a stallion owner, has about nine stallions. Can say for your paper that it is certainly an encyclopedia on draft mares and stallions.—W. C. Severens, Allen county, Ohio.

BREEDING INVESTIGATIONS.

Owing to the good results obtained from the public breeding demonstrations and investigations last year, we will carry on another campaign during the next breeding season. We will have three men traveling in different states through most of the spring months, including Frank B. Graham. We may decide to announce in the paper in what sections the work will be done, so as to give those in that section of the country an opportunity to be present. All these demonstrations are made without charge to anyone. It has afforded an excellent opportunity for making investigations of the right kind. At numerous places last year 50 mares were assembled ready for use. It is surprising to know how many mares there are in some communities that are in bad condition. The results of the past breeding season will be given in a later issue.

SOME GESTATION PERIODS.

As you invite short sketches from all breeders, I am giving you a little food for breeders to think about. I have been in the breeding business for 25 years and have had many strange experiences.

The period of gestation in mares is very variable. The records show, according to good authorities, that the average of 100 mares is 343 days. My first experience in freaks was in the old Morgan mare, Kit, the dam of Little Tom 4627, A. M. R. She carried him 381 days. As there was but one service, no mistake was possible. On July 13, 1911, one of my mares dropped a filly that she had carried just 310 days. This colt is large and well developed today as any of her age.—E. A. Ricard, Ashtabula county, Ohio.

STANDARD RECORD MEETING.

At the Standard Poland China Record Association meeting on the 3rd and 4th J. O. James of Braddyville, Ia., was chosen president, Secretary Geo. F. Woodmont and Treasurer C. D. Bellows were re-elected, and the following were chosen as vice-presidents for the various states in which the record has a following:

B. A. Leak, Phoenix, Ariz.; Lloyd Spencer, Okalona, Ark.; John Blain, Long Beach, Cal.; Edward Wray, Wray, Col.; J. M. Royston, Fayette, Idaho; J. F. Cox, Keitsburg, Ill.; G. C. Glynn, Sioux Rapids, Ia.; Leon Calhoun, Potter, Kas.; J. B. Van Cleaze, St. Mary's, Ky.; Fred Stetplugh, Alden, Minn.; W. A. Baker, Butler, Mo.; I. F. Tyson, Glengary, Mont.; Lyman Peck, Fort Calhoun, Neb.; Samuel Little, Hagerman, N. M.; A. B. Campbell, Geary, Okla.; E. E. Shields, Gervaise, Ore.; E. Monson, Waubay, S. D.; W. J. Duffel, Cloud, Tex.; E. E. Ferson, Sunnyside, Wash.; T. B. Gill, Sheridan, Wyo.

The 1912 directors are E. E. Carver, Guilford, Mo.; George Falk, Richmond, Mo.; W. O. Garrett, Maryville, Mo.; Sam McKelvie, Lincoln, Neb.; J. B. Potter, Harper, Kas.; J. B. Lawson, Clarinda, Ia.; J. R. Roberts, Deer Creek, Okla.

The St. Joseph Stock Yards Company gave the hog men the usual banquet, Wednesday night. No change was made in the time or place of meeting for next year.

LAST CALL
For Mare Owner's Editions

All subscriptions for the mare owner's clubs of 10 or more sent in by a stallion or jack owner, at the rate of 10 cents for each name, to receive this issue and four more, must order them **before February 1st.** We can fill orders up to that time. ¶ We have received an unusual number of orders, but there are always a few breeders who have been delayed in taking advantage of the offer we make. ¶ Send orders to---

Graham Publishing Co.
225 W. 12th Street :-: :-: Kansas City, Mo.

Do You Keep Good Hogs?

There will be no better Live Stock Property in 1912, and there will be few Opportunities So Good For Buying as in the

Public Sale of Lee Gross, Feb. 12., Stock Yards So. St. Joseph, Mo.

At this time and place Mr. Gross sells his entire herd of over 50 BIG PRACTICAL, POLAND CHINA HOGS and it stands to reason that anyone wanting some really good stock will find this an unusually good place to buy.

A dispersion of a herd of this character affords an opportunity for the selection of superior individuals, and in numbers, that is seldom offered. All the great producing sows of the herd, the herd boars and the gilts—the result of careful and intelligent mating. Something over 50 head in all, and all bred for early litters. Twenty-five tried sows and twenty-five spring gilts. The sort that have made the Gross herd; the practical, money making kind; the kind with size and finish, and the kind that will make the buyer money.

Among the more important sows to be sold are LADY JUMBO 1st, by Big Price, the pick of all Dawson's great Jumbo sows; LADY WONDER 5th, the great Wheeler sow, dam of famous A Wonder litter, and said to be the largest sow on record; LADY MASTODON 96th, by A Wonder, a great individual and a great producer of herd headers. BESSIE K, by Kansas Wonderful Chief, one of the very best producers and mothers in the herd. Others by Long Wonder, Western Chief, Hadley, Expander, Long King's Equal. These sows are all bred.

THE HERD BOARS include EXPANSION'S SON 51539, by Expansion. There probably isn't another boar in service today that embodies to a greater degree the very essential points of size with quality than does this remarkable boar. Expansion's Son has everything to recommend him as one of the leading sires of the day; a 3-year-old, just in his prime. Also MISSOURI JUMBO 58268, by Prospect, by Big Prospect, dam Lady Jumbo 1st by Big Price, and he by the great Pawnee Lad. Anything the matter with that pedigree? And he breeds as good as his pedigree reads. A great line of fall pigs, the best Gross ever raised, are by MISSOURI JUMBO. A 2-year-old in March. This boar is a diamond in the rough. Also GROSS' EXPANSION by Expansion's Son, a choice yearling.

YOU CANNOT AFFORD TO MISS THIS SALE.

You cannot afford not to own one or more of these great sows. A cordial invitation is extended to all to be at this sale, meet the breeders, and buy if you want something and like the stuff.

Get the catalog or any other information you want by addressing,

Lee Gross :-: Nodaway, Mo.

Buying orders, if you cannot attend, can be sent to either auctioneer, R. L. Harriman or Harve Duncan, in care of Mr. Gross.

VETERINARY

AND OTHER QUESTIONS

We will gladly answer all questions pertaining to equine production and marketing. All questions should be on a separate sheet of paper and reach this office by the 20th of the month. No questions will be answered by mail. These answers are for the benefit of our subscribers only. Each question submitted is answered by the best authorities in the country. We will not publish the names, initials, town or state of anyone sending in questions to be answered in this column. Quite frequently these are of a very confidential nature and we do not wish to injure anyone by such publicity. We are glad to get these questions and extend to our readers an invitation to ask questions.

SKIN DISORDERS—I am interested in a Percheron stallion that was bought of one of the best concerns. He is a very well bred horse and gets extra good colts. He has a germ skin trouble confined to his left fore and hind leg. It is entirely healed at times and then cracks open in shallow cracks confined to the skin only, and dry in appearance. When healed they leave a scar without hair. They don't make him lame nor do they cause him to bite them. They are in evidence most of the time, but more apparent and larger in the warm weather and fly time. What is the remedy for it? Is it transmittable, and what is the final outcome? Would it hurt this horse to put him to work on the farm as one of a farm team?

REPLY—The skin of some horses is easily irritated by substances like water, mud, soap, harsh curry combs, filthy brushes, etc. During the breeding season when the horse is supposed to be receiving the best of care, attention to the above suggestions is in order. Avoid mud and other contaminations that call for much washing of the limbs. When it is found necessary use but little soap and be sure that it is mild. Always dry the limbs with clean cloths after washing. A small amount of blue ointment rubbed into these places usually keeps the hardened skin soft and favors healing. We think your horse would be positively benefitted if permitted to do farm work, provided you could control those irritating agencies above mentioned.

LAME COLT—When my mare was carrying her colt she got her front leg broke. She crippled around and does yet, the colt is lame on the foot of the same side the mother was, and a short time ago I found he had no frog in that foot. Is there anything I can do for him?

REPLY—Your limited description of the case does not enable us to form any conclusion as to the cause of the lameness. We would suggest that you have your colt carefully examined by a competent veterinarian.

SUSPECTED GLANDERS—I have a mare about eight years old, weight about 1,250 pounds; in good flesh and feels good otherwise. Last spring she got a few small lumps on her breast about the size of a bean; they were loose under the skin. In the summer she got more. This fall her right leg swelled up and broke open; this was November 1. The sores are small and round. The first few days after a lump breaks open it runs a few inches down her leg and dries up. After that it dries up as fast as it comes out in form of large scales or scabs. When driven the swelling goes down some. Last summer she was fed hay, and corn and oats ground together. This fall corn fodder, hay and oats in bundles. This winter she gets fodder, hay, flax straw, oats straw, and about two gallons of oats per day. I have been giving in feed this winter salt and sulphur. I keep her in a warm barn. Please tell me what to do for her.

REPLY—Judging from your letter we are inclined to suspect that your mare is affected with glanders of the contagious variety. At least you should not lose time, but should call in a competent graduate veterinarian and have him not only make a careful clinical examination, but give the animal the mallein test to remove all doubt. There are a few other diseases that resemble glanders, but you should have the point settled as early as possible, inasmuch as glanders are incurable and hence, if present, is endangering the lives of other horses you may have. In your locality, glanders is not inclined to assume the same severe forms it does further south, therefore it is capable of holding along for a number of years in an affected animal and the animal maintain a fairly thrifty appearance during the period.

PROBABLY RHEUMATISM—I have a two-year-old colt which got the horse distemper last February and didn't recover until about the 15th of June. In all this time he was discharging in the neck. Sometimes the discharge was clear water and other times it was matter. Now this colt never was lame before, but after he had the distemper about one month he would swell up sometimes in one hind leg and maybe the next day the swelling would be out of that leg and then the other hind leg would be swelled up, and after awhile he would go kind of lame in either one hind leg or the other, and finally it settled in the left hind leg. The first of July I turned him out to pasture and after he had run about 60 days he seemed to be all right. But now since he has been in the barn again he seems to be about as lame as he was when I turned him out. I have had him examined but can't find any enlargement of any kind anywhere. Is it possible that this could be from the effects of the distemper and that he may outgrow it? The only treatment I gave him while he was sick was Spons' Distemper Cure. I had to steam him at first before he broke.

REPLY—Your colt's system was loaded up so long with the products of the disease that he is now suffering from its effects in the form of rheumatic pains. Give him one-half ounce of salicylate of soda with one dram of nitrate of potash in his feed three times a day. Should he refuse to eat the mixture the drugs may be given by means of one ounce metalic syringe after dissolving them in a little water. Continue this treatment for a week and then in its stead give one dram of iodide of potash dissolved in a little water three times a day, at least thirty minutes before feeding grain. Alternate these two remedies, week about, for three or four weeks necessary. The delay in the wound healing was due to an involvement of one of the salivary glands.

OPHTHALMIA—I had a fine road stallion that had the pink eye last Spring during the breeding season. He first took it in one eye and as it began to get better, he took it in the other. Since then they have had a bluish or milky color, and lately they seem to be getting worse, and I fear that he will lose one if not both of his eyes. Is there anything I can do to help them?

Reply—Your horse is affected with ophthalmia and we fear on account of the tendency it is showing to recur, that it is of the periodic kind. During the early period of the attacks, attempt to allay the inflammation by keeping a thick pad of absorbent cotton over the eyes, which should be wet at frequent intervals with clean cold water into which a little salt has been dissolved (teaspoonfull to one gallon). Follow this with a mixture of proto iodide of mercury and vasceline, using ten grains of the former to one ounce of the latter. Place a little of this salve between the lids three times a day. Keep the animal in from the bright sunlight when the eyes are affected. Remember there is no assurance that you will save the sight, but it is well worth trying for, so persist in the treatment for a few weeks at least.

PECULIAR DISCHARGE—I have a mare colt that I would like to know what is the trouble with and what to do for her. She is about 7 months old, been weaned about six weeks, was in good condition when taken off the mare and did well the first two weeks. Then she got cut in the wire on the hind foot, under the fetlock, which proved a bad cut but is healed up now.

LAST TERM OF THE SEASON

GRAHAM SCIENTIFIC BREEDING SCHOOL

FEBRUARY 15 TO 23, 1912

¶ Eight days and nights of practical lectures and demonstrations, by the best authorities, on horse breeding subjects. ¶ Money cheerfully refunded to any dissatisfied student. ¶ Successful graduates all over the country, who have doubled their per cent of foals, and are doubling their income without increasing their investment.

500 Mares can be bred to one stallion with the latest method, and get a greater per cent of foals than can be had from breeding 50 mares with the natural service to the same horse

¶ Learn to detect disease that can be transmitted from one mare to the other by a service. Stallion or jack owners lose hundreds of dollars every year by breeding diseased mares, that require an educated man to detect. ¶ Come to the next term of School and see these mares dissected so you can tell one when you see it. ¶ There are dozens of subjects thoroughly discussed in plain language, of great value to all breeders.

Did you ever hear of a dissatisfied student from this School? No! They all get more than they expect. Nearly all say they didn't know there was so much to learn or of such great value to them.

Board and room from one dollar to one dollar and a quarter a day. School in first building north of Convention Hall. Take Observation Park street car at Union Depot; get off at 12th street and walk one block East. **Tuition is $25, which entitles all students to a free return privilege for life.** ¶ For other information address

The GRAHAM SCIENTIFIC BREEDING SCHOOL

225 West Twelfth St., Kansas City, Mo.

About two weeks ago she began to lose flesh. Did not eat good and her water is affected in a way I never have seen before. She has an almost constant discharge of a light greenish color, kind of stringy substance which gathers on the legs and tail. She is now skin poor but gets around all right and runs and plays with the other celts. I am feeding her ground barley and corn mixed, half and half, and put a spoonful of International Stock Food into it. Also feed alfalfa and prairie hay that is in excellent shape. Let her run in the fields in good weather and keep her in the stable nights. I give her all the grain she will clean up, which is about one quart twice a day. There is no veterinarian to my knowledge within 150 miles.

REPLY—It is very important to know from what organ comes the discharge before attempting treatment. It very likely comes from the vagina or uterus, or may be both organs are involved. Inasmuch as you are unable to procure the services of a qualified veterinarian we would suggest that you irrigate the vagina of the colt once a day with permanganate of potash solution, using one-half teaspoonful of the drug to one gallon of boiled water. The water should be used not colder than body temperature and may be introduced with a fountain syringe. Give the colt one-half ounce of the elixir of iron, quinine and strychnine, three times a day, either with feed or with syringe by the mouth.

ABORTION—What can I do for my mare to keep her from aborting? She has had three colts and but one lived.

REPLY—When the habit of aborting has become well fixed as in the case recited it is very difficult to make dependable breeders again. We believe you will do the right thing if you will place her under the care of a good, competent veterinarian. In a generall way mares that abort, and especially if they repeat, should be given a good cleaning up subsequent to the trouble. This means proper irrigation of the mares and disinfection of the premises. They should be permitted to go over a year that they may have time to become sound. After being bred and settled, agents like black haw, carbolic acid, etc., may be given in the feed with a view to preventing a recurrence of the act. We still think your case justifies the personal direction of a qualified man.

SWELLED TESTICLES — Some months ago an articles appeared in the Stallion and Jack News telling how to make a support and what to do in case of accident. Will you please reprint it as three of my young stallions are beginning to swell?—L. P. F., Minnesota.

Reply—As soon as the testicle is seen to be enlarged, a support should be put on the animal and the inflammation reduced as much as possible. Otherwise, these animals may not prove to be very sure in after years. The weight should be removed from the ligaments and cords in order to reduce the swelling properly.

It is a very simple matter to make a homemade support. Take a piece of heavy cloth about a foot to eighteen inches square, depending on the size of the individual and the condition. At each corner sew or tie a string long enough to reach up to the center of the back to be tied. The two front corner strings go up over the loins and tie. The two back strings go up between the hind legs from behind and tie into the other strings on top of the back. If the animal is rough on the hips, the large center bone can be made use of to keep the strings in place, by running the two back strings up past the tail and leaving about ten inches between the two strings that are tied into the others. The two back strings should be tied together between the tail and the strings running around the body. This will leave a loop around the high point on the back of the animal so that the support will hold its position. If the animal be fleshy and have a crease running from the tail forward, the crease can be made use of by running the two back strings up through it and tying them; or a back band can be put on the animal with a crupper, this to be used to keep the support from slipping one way or the other. In this large cloth cut a round hole large enough for the penis to go through. Before the support is put on, it should be heavily padded with cotton. If there is any fever, antiphlogistine (Denver mud) should be put on the cotton about a quarter of an inch thick and be renewed every twenty-four hours until the swelling is relieved. If the swelling is intense it might be well to use hot water. In this case, the pad should be made of oilcloth without a hole in the front for the penis, so that it will hold water. Warm water should then be poured in the oil cloth basin at about 110 degrees. This water should be renewed every half hour by emptying the oil cloth basin.

If the testicles are not swelled too large to interfere with locomotion, the animal should have a mile or two of very slow exercise daily. The feed should consist principally of bran and a little oats, alfalfa, clover hay or some other laxative food. The feed should be fed sparingly.

This is a good remedy in case of an accident, but if the accident is severe a qualified veterinarian should be called as soon as possible. When an animal has swelled testicles caused from influenza or practically any other cause, a veterinarian should be called promptly, as it is a serious condition and may result in the retirement of the animal. Any animal in this condition should be well cared for and great care should be taken that it does not take cold. All mares or jennets should be kept away, so as not to aggravate the condition. In the matter of influenza or similar diseases the clinical thermometer should always come into play. Take the rectal temperature immediately, so as to find out whether the animal has any fever or not. If in a normal condition the temperature will be about 100 degrees when the horse or jack has not had any exercise for several hours.

HOW A VETERAN TRAINS JACKS.

To the American Breeder:—I am 66 years old and have had 26 years' experience in the jack business, and have never written anything to be published. Would not write this time, only that I don't agree altogether with the instructions I saw in your last paper in regard to the way to educate a young jack. The part that I don't think is right is that when you have tried him a few times is to let another jack serve the mare and then bring him out and let him serve. I would do this when everything else failed, but I would work with him a month before I would try that plan. As you say, a jack goes by scent. Now he scents the jack on the mare, and the next time you bring him out to serve he will be hunting for the same scent, and as like as any way he will not serve. I think this plan is next to letting him serve a jennet; not quite so bad. A much better plan would be to let a horse serve the mare, and then try the young jack.

I have had some experience with spoiled jacks. If there is anything that will make a man swear that will. I sold a two-year-old jack that had never served, and I guaranteed him to serve. As he was a very game and lively one, I thought we would never have any trouble to get him to serve. The man I sold him to had an old jack, and a few days after he got home with the young jack, he had a customer to his old jack. After he had served the mare with the old jack, he said, "If you have no objections, I will try the young jack." The young jack was brought out and by the time he got to the mare he was ready and served the mare at once, and this spoiled him, and I had to take him back. He wanted to scent the jack on every mare.

I took the jack home, put him in a long shed and haltered him at one end, turned two fillies in with him, and let them stay in there until he wanted to serve them, and I served six mares with him that season. There was some trouble the next spring, but finally I broke him. I bought two jennet spoiled jacks and sold one and broke the other. This is the way I did: He would not serve unless he saw a jennet. I put my pit close by the side of the barn, and put the jennet at the end of the barn, and would lead the jack and let him see the jennet, but just as few times as I could get him to work, and finally I got him to work without one, but always had to lead him to get him ready.

I don't altogether agree with you about the scent. I don't think a jack always goes by scent. You take a young jack and let him serve five or six gray or yellow mares at the first service he makes, and see if he wants to serve any other color. Nearly all the jacks that I have handled have showed a preference for some color, but they go more by scent than by color.

Now, my advice is to keep young jacks as far away from other jacks and mules or jennets as you can.—P. H. Vories, Gallatin county, Ky.

STALLION SERVICE RECORD BOOK

Every Stallion or Jack owner Should have this record book, because it is accurate. It is a handy pocket size, with a Waterproof cover, printed on best of paper.

It has a calendar, also a gestation table. It has an index of ten pages, so that each mare can be found easily It has room to give a complete record of each mare. 100 mares can be recorded, each mare having a whole page. The blank at the bottom of each mare's page, when properly filled out and signed gives you a promissory note that is legal and binding.

If you ever use one of these records you will want more of them, just as thousands of others are doing. It has no worthless advertisements in it. It is the latest Stallion Record Book on the market. If you are not satisfied with it, return it, and get your money, which will be cheerfully and promptly returned to you.

PRICE; 50c EACH OR 6 BOOKS FOR $2.00, POSTAGE PREPAID

Record of a 1911 Market

Less Business at Chicago Than in 1910, in Spite of Larger Receipts. Upturns on Later Developed Scarcity Couldn't Overcome Early Price Depression. Horse Prices Alone Averaged Higher.

In spite of the late upturns in values the Chicago stock yard statistics for 1911 show a shrinkage in the business done in cattle, hogs and sheep marketed there of over $19,000,000 from the record of 1910. The number of carloads handled was 20,580 larger than in 1910. This apparent discrepancy is accounted for by the fact that prices for the first half of 1911 were considerably lower than usual, enough to make a decline of 40 cents in the year's average for steer prices from the average of 1910.

In a review of the year's live stock market at Chicago the Drovers' Journal gives the following items going to make up the year's total business for that point:

Cattle, $180,206,174, against $188,740,722 in 1910, a decrease of $8,534,548; calves, $5,788,785, against $6,409,245 in 1910, a decrease of $620,460; hogs, $110,037,446, against $118,047,357 in 1910, a decrease of $8,009,911; sheep, $24,634,185, against $29,346,532 in 1910, a decrease of $712,347, while horses were valued at $18,818,100, against $14,601,825 in 1910, an increase of $4,216,275, this increase in valuation being due to greater marketings and likewise a higher average cost of the animals.

Greater Production Is Needed.

It is clear that the growth of consumptive demand, a natural consequence of growing population, calls for increased breeding and feeding of live stock. The new west and northwest, once great breeding grounds for live stock and particularly cattle and sheep, are consuming more and more of their own product. The corn belt can no longer depend upon the west for a great share of its cattle supplies. There must be more native cattle raised and fattened for market in the corn belt, and the conditions which make this a necessity will also make it worth while.

For 1911 cattle, hogs and sheep all averaged lower in prices than in 1910. Steers made an average of $6.40 for the year, against the record average of $6.80 the year previous. Calves averaged $7.60, against $8.10 in 1911. Average price of hogs was $6.70, a decline of $2.20 from the record average of 1910, while sheep averaged $3.95, against $5.25 in 1910. Average price of lambs for the year stood $5.95, against $7.55 the year before, while general average prices for various grades of horses were $5 to $13 per head higher than in 1910.

In November and December, when there was great shortage of prime beeves, highest prices in two years prevailed for best kinds. Hundreds of prime heavy and yearling beeves sold at $9.00@9.25 and two droves landed December 14 at $9.35, while on December 4 eleven head of fancy Angus beeves which had been fed in connection with the grand championship load of the International sold on the open market at $9.75. The highest price for loads since 1882 was paid in December, 1909, when steers sold up to $9.50, while the highest figure ever paid on the open market in Chicago was $10.25, this price being established in 1867.

But early last year it was plainly a case of liquidation of heavy steers. Feeders were simply scared out. Market continued to decline from January to May and the cost of production being high feeders continued liquidating heavy beeves. Supplies of the strictly good to choice grades ran far in excess of the trade needs, with the result that these sold relatively lower than the medium and short-fed steers, a narrow price range being in force for up to June. In the following two months conditions were changed. Heavy beeves were no longer over plentiful. They grew scarce, in fact, and the prices for them advanced by leaps and bounds.

In further verification of the growing scarcity of the high class feeder from the range it is pointed out that new record top prices for range steers and also a record average price for rangers were established in the year, choice Montana steers selling up to $7.90 in November, exceeding the previous banner top price of 1909 by 30c, while the average price for range steers at $5.65 in 1911 stood 25c higher than the previous record of 1910.

Under pressure of a big increase in receipts prices for porcine marketings declined sharply from the high levels attained in 1910. The receipts showed 1,516,502 increase over 1910, being direct result of growth in production consequent to the high values of that year. Average price of 1911 was $6.70, against $8.90 in 1910, while the top price of $8.30 compared with $11.20 in the year before.

Highest prices on record in sheep and lamb trade in 1910 induced considerably increased production and resulted in a new record volume of marketings for 1911. Under the increased receipts prices declined severely and it was a year of heavy losses for sheep producers. Fear of elimination of the wool tariff caused consternation among the sheep growers and in the last six months of the year there was excessive liquidation which brought values down to lowest levels in years previous.

Average price of native sheep dropped to $3.65, a decline of $1.45 from 1910, and stood lowest in a dozen years, while western sheep, averaging $4.05, showed $1.30 decline from 1910. Average price for all grades of sheep was reduced to $3.95, or $1.30 lower than 1910. Lambs of all grades averaged $5.95, against $7.55 in 1910. Total year's sheep receipts were 5,736,244, against previous record of 5,229,294 in 1910.

Horses Alone Showed Advance.

In the horse market volume of business and prices as well exceeded the expectancy of the most sanguine promoters. Receipts at Chicago were 104,545, comparing with 83,439 in 1910, and a broad commercial demand for business animals effected higher prices in spite of the inroads of the automobile truck upon city commercial demand for horses. The agricultural demand for horses is constantly broadening, as the western and northwestern states are being more extensively cultivated, while there was also a considerably increased call for horses from the Canadian northwest. Average values during the year advanced $5.00@13.00 per head above rates prevailing in 1910.

Land For Percheron or Jack Stock

320 acres of farm land in Oklahoma to exchange for registered Percheron mares, stallions, jacks or jennets. Address Geo. H. Dodson, P. O. Box 502, Oklahoma City, Okla.

HERE'S TWO OF THE GREATEST BARGAINS IN THE U. S.

For a few days I'm going to offer them at much less than half value.

No. 1. Consists of a beautiful East Kansas 240-acre corn and alfalfa valley farm; adjoining a city of 20,000 people. Improvements consist of a modern 10-room, 2-story residence; full cement basement, beautiful lawn, with 150 large evergreen trees and shrubbery, 350 barrel cistern, etc. New barn, 60x60, 36 feet high. Stalls for 14 horses and 30 cows. Orchard and abundance of good water. 230 acres under a high state of cultivation, 80 acres in wheat, 10 in fine timber, much of it walnut. This grand farm is worth $250 per acre. Price, only $75 per acre. Terms, $12,000 cash, 8 years time on balance at 6½ per cent.

No. 2. Consists of an 8,000-acre Missouri ranch, ¾ mile to good railroad town, well fenced and cross fenced with wire. Six or seven houses and barns. 300 acres a creek bottom, 6,000 susceptible of cultivation; abundance of stock water. (Owner sold last year $30,000 worth of stock). Plenty of good timber and grass. No better orchard land in the state. Is also a fine colony proposition and is really worth $35 per acre. Owner says let it go at $15 per acre if sold at once. Here's a chance to double your money on either of these farms in a few months. Address **J. E. Thompson (The Farmer Land Man) Tecumseh, Shawnee county, Kansas.**

AMONG THE BREEDERS

PUBLIC SALE DATES.

Upon request we will announce, under this head, free of charge, the date and location and the name of proprietor or manager, for all public sales of pure-bred live stock which are to be advertised in the columns of the American Breeder.

FOR SALE AT ALL TIMES.

As fine a bunch as can be found on one farm. Guaranteed as represented. Prices right. Come and see them.

J. T. Watson, New London, Ralls County, Mo.

OAKLAND STOCK FARM

Only Jacks and Jennets of my own Raising.
I AM NOT A BROKER, BUT A BREEDER.

The intention in starting this breeding farm a number of years ago, was to breed a line of jacks that would produce the Big Missouri Mule, coupled with the ordinary mare. All my jacks and jennets are registered in the American Jack Stud Book. I do not buy jacks—I raise and sell and guarantee my stock, because I produce it.

I have on hands 55 head; 27 jacks, the rest females. The farmer who desires a jack can come and pick him out and buy from the producer, with a guarantee. I have been here thirty years, and give for reference, Bank of Chillicothe, or any man you might know in Chillicothe. I will sell for cash or on a bankable note. I am not selling these jacks because I want to quit the business; as long as I live, I intend to raise jacks. I raise them to sell, and as to prices, I am willing for the purchaser to make money—I don't want it all.

Scott J. Miller, Chillicothe, Livingston County, Missouri.

P. S. This is the home of the only white-faced jack in the world; result of scientific breeding. He is now on the farm and will not be priced to anyone.

PUBLIC SALE JACKS AND JENNETS.

My first annual offering includes 18 head of high class Registered Black Tennessee Jacks and Jennets. Every animal guaranteed to be as represented; nothing priced or sold privately after catalogued.

If interested, WRITE FOR CATALOGUE and come to the sale. You will be sure to be pleased with the offering.

CATALOGUES will be ready to mail February 1, 1912. **Sale at FRUITLAND, MO., THURSDAY, FEB. 15, 1912. Ben. M. Green, Fruitland, Cape Girardeau County, Missouri.**

Fairview Jack and Jennet Farm

A fine assortment of the best Mammoth jacks and jennets that grow, 14½ to 16½ hands high; jacks with lots of bone and substance. Everything guaranteed as represented. Prices right. Address

J. C. Huckstep, Eolia, Pike Co., Mo.

JACKS FOR SALE

Two extra good, medium size, four-year-old jacks, black with white points and well broke. Are half brothers to "Longworth," 1st prize jack at Illinois State Fair, 1911. Barn in town. **Robert Penman & Son, Philo, Champaign county, Illinois.**

JACKS AND JENNETS FOR SALE

I have 25 head of jacks on hand and 40 jennets that I can sell cheaper now than in the spring. If you want to make more money on your feed than you ever did before, and have stock used to its new home when the breeding season begins, come and see what I have. **Philip Walker, Moline, Elk Co., Kansas.**

Jacks & Percherons

Will sell one, or a carload of black registered jacks at reasonable prices. They are the high class kind. Don't handle cheap inferior jacks; this has been a breeding barn for 70 years. Catalogue January 1. **G. M. Scott, Rea, Andrew County, Missouri, R. 2.**

FIVE JACKS---TWO STALLIONS

3 two-year-olds; 1 three-year-old; 1 four-year-old; two Percheron stallions one registered. All good ones but one small jack. Colts to show. I have too many and will sell some cheap. **H. A. Wehrmann, Monticello, Louis county, Missouri.**

Leavenworth County Jack Farm

Forty-four head of Jacks and Jennets and our Percheron Stallion. Write for prices. Corson Bros., Potter, Atchison county, Kas.

20 Black Jacks For Sale 20

Twenty big black jacks, with white points, for sale. Ten, from three to seven years old; five, coming two years old. They have lots of size, bone, quality and style. Write for catalogue. We also have 200 mare mule colts, for sale in car load lots.

SCOTT, ABNEY & JENKINS
Virden, Macoupin Co., Ills.

JACKS AND SADDLESR

We are the largest breeders in the United States of Kentucky Mammoth jacks and saddle horses. We are also breeders of big black pigs, Tamworth and Hampshire swine. All stock registered or subject to registry. Write for catalog, or visit our farm. **J. F. Cook & Company, Lexington, Fayette County, Kentucky.**

TWO STALLIONS, ONE JACK

Standard bred trotter, 16 hands, weight 1,265, register No. 0528. Percheron and Shire horse, extra good. Mammoth jack, black; white points, Register No. 1232. They are right in every way, sold only to close estate.

George Woodruff, Eldorado Springs, Cedar County, Missouri, R. 4.

AL. E. SMITH'S Stock Farm

Seventy-five registered Black Mammoth Jacks and Jennets, 15 to 16 hands standard, imported and home bred. Some good Percheron Stallions. More good big boned, high class jacks and jennets than you will find in any one barn. Forty miles west of Kansas City, Al. E. Smith, Lawrence, Douglas county, Kas. R. 1.

MAMMOTH JACKS and JENNETS

25 big black mammoth jacks and jennets. The breed that sired the World's Fair premium mules and the Grand Champion Jack of the Illinois State Fair for the past two years. All stock fully guaranteed. Prices very reasonable. **James M. Spurgeon, Williamstown, Lewis County, Missouri.**

THE KENTUCKY JACK FARM

Established 1884

BREEDER of registered, Mammoth Kentucky jacks and jennets; big bone; plenty of weight. Forty head of 3 and 4-year-old jacks; also young stock for sale. Would be pleased to have you visit my farm for inspection or write for prices. I guarantee to please you. **Joe E. Wright, Junction City, Boyle County, Kentucky.**

Jacks For Sale

26 fine large Tennessee jacks; 6 months to 7 years old. Also 24 jennets bred to fine jacks. Prices right. Catalog free if you mention American Breeder. **S. W. Jetton & Co., Murfreesboro, Tenn.**

Home of the Giants

75 head of jacks and jennets. Won nearly half the ribbons at Sedalia in 1911. We think we have the finest herd of jacks and jennets in Missouri. We have these prize winners for sale. We handle the big black, big boned, big footed kind. The kind that raises the big thick mules. **Bradley Bros., Warrensburg, Johnson County, Missouri.** 65 miles East of Kansas City, main line Missouri Pacific. Right in town.

EIGHT FINE JACKS

From 2 to 7 years old; well bred and good size. All black but two. Colts to show. Must sell some of them to make room. **Henry Kersting & Son, Gilmore, St. Charles County, Missouri.**

TWO BIG JACKS

Four and eight years old, with white points; well broke and sure; can show colts; good bodies, heavy bone, first class in every way; will sell worth the money. Don't need these.

Robert L. Wood, Strong City, Chase county, Kansas.

FAIRVIEW STOCK FARM

25 Mammoth jacks from weanlings to 8 years; largest breeding herd in the West. Special prices for fall sales. Herd headed by the great Pharoha 2491, Champion of Tennessee in 1910. **H. T. Hineman, Dighton, Lane county, Kansas.**

EXTRA FINE BLACK JACK

Six-year-old; with white points; King Leo, register number 4715; weight, about 1050 pounds.

Was bred and raised by J. F. Cook & Co., Lexington, Ky.

He is a quick server and sure breeder; has the colts to show.

If wanting to buy a fine jack write to

J. W. Gillum, Wing, Yell Co., Ark.

Snyder & Stalons, Oskaloosa, Kansas, advertise three Percheron stallions.

Young Percheron stallions by the show horse Brilliant D. 45336, are advertised by the Edgewood Farm, West Branch, Cedar county, Iowa. Notice the announcement of their breeding farm.

J. C. Huckstep, Eolia, Missouri, is back in the paper with his regular announcement of a fine line of jacks and jennets for sale.

L. L. Brown, Childers, Oklahoma, advertises a 5-year-old black Percheron stallion for sale or trade.

One thing no stallion owner can afford to do without is a good season record book. The American Breeder puts out what is probably the most sensible and convenient of all. The books are 50 cents each, or 6 for $2.

J. A. Tallmadge, Madison, S. D., advertises for sale three Shire stallions.

Carl Lindstrom, Vinland, Kas., advertises a Morgan stallion and a big black jack for sale.

Eighteen head of registered black Tennessee jacks and jennets will be sold at auction at Fruitland, Mo., February 15, by Ben M. Green of Fruitland, Mo. Write him for catalogue.

Notice the new advertisement of one of Kansas' big importers of Belgians and Percherons, Dr. W. H. Richards of Emporia. With the barns of Dr. Richards and L. R. Wiley both located at this point, Emporia becomes the leading draft horse town on the Kansas map.

Horses and land go together. And one cannot afford to become so absorbed in one as to forget the other. In the way of land here is a proposition advertised by J. E. Thompson of Tecumseh, Kas., which merits close attention. There are two propositions in fact; one valley farm of 240 acres corn and alfalfa land, and adjoins one of the best towns in the state. The other is an 8,000 acre Missouri stock ranch, practically adjoining a good railroad town, being only three-quarters of a mile from the station. Full description in advertisement. Write Mr. Thompson.

J. G. Truman, manager of the Pioneer Stud Farm at Bushnell, Ill., writes: "We are in receipt of a letter giving us full particulars of the importation of Shire and Percheron stallions that are at the present time on the ocean and due to arrive here on Wednesday next. Our Mr. J. H. Truman advises us that so far as the Shire end of the importation is concerned that he thinks they are the very choicest lot of Shire stallions from two to six years old he has ever shipped us. Each horse is a show horse and well up to the Truman standard.

My brother, Mr. H. H. Truman, who purchased all our Percheron stallions, writes that he scoured the Perch district and that the Percheron horses in this shipment are by far the best lot he has ever shipped us. So that we firmly believe when these horses arrive that we have never been in as good position to supply the American farmer and breeder with strictly high class Shire and Percheron stallions as we will be when these horses arrive next week. We certainly have a great lot of horses here at the present time. Practically all of our prize winners the past fall are here and for sale. Our 1912 catalog is now ready for distribution and will be mailed to anyone interested in strictly high class Shire, Percheron, Belgian and Hackney stallions or mares."

SIX STALLIONS

Clydesdales, and a Morgan. All of breeding age and of the best breeding. All broke to harness and used on the farm. All have won prizes at county and state fairs. Those that have been tried are extra good breeders. Prices very reasonable. Correspondence solicited. **Painter Bros., Middletown, Henry County, Indiana.**

W. H. Bayless of Blue Mound, Kas., has recently returned from Europe with an importation of Percheron and Belgian stallions. They also have some home bred registered draft horses for sale. This stock is in good breeding condition. Write for full particulars.

One of the first of the big winter and spring sales of jacks and jennets will be held by G. C. Roan at La Plata, Mo., his dates being February 26 and 27. Full announcement of this important sale will appear in our next issue.

The annual Lime Stone Farm sale of jacks and jennets will be held this year on March 5, as announced in our sale date column. L. A. Monsess & Son, proprietors of this world famous breeding establishment, have made a record in this annual public sale which has no equal for jack and jennet stock in America, or anywhere else, for that matter. Detailed announcement concerning the sale will appear in our next issue.

Notice the advertising of the two big firms at Lexington, Kentucky. J. F. Cook & Company, known the world over as breeders of jacks and saddle horses. And H. T. Brown & Company, who are on the road to equal fame as breeders of jacks and Percheron horses, and who also breed Tamworth swine. The barns of both firms are filled with the usual good assortment of stock for sale. Catalogues and other information furnished promptly on application.

Public Sale of Horses and Jacks.

One of the first horse and jack sales of the season will be held February 15 at Dr. W. E. Cheatham's Breezy Point Stock Farm, Excelsior Springs, Missouri. The farm is just half a mile west of city limits. Twenty-five head of stock will be sold, including fancy saddle bred, and registered saddle horses and Mammoth jacks and jennets. Dr. Cheatham has been in the breeding business for 35 years, and his studs contain the blood and get of many noted animals. Several of the young jacks in the sale are by Giant King, that sold for $2,000, as a two-year-old, and is a son of King Mammoth formerly sold by Dr. Cheatham and is a half brother of the 2,200-lb. Missouri Queen, said to be the largest mule in the world. Write Dr. Cheatham for any further information about the stock in this sale and mention the American Breeder.

REGISTERED MORGAN HORSES

FOR SALE—Coming 2, 3 and 4-year-old stallions of large size, fine breeding and great style and action, high headed, clean boned and heavily muscled—the greatest all-purpose horse the world has ever known; fearless and untiring goers, but so level-headed that any lady can drive them; The Admiral 4871 A. M. R., 15¾ hands, weight 1,250 pounds, at head of stud. He was sired by Jubilee De Jarnet. Prices moderate.

RICHARD SELLMAN,
Mountain Vale Ranch,
Rochelle, McCulloch County, Texas.

Hackney Stallions All Ages

Drafters, Road and Coach

Horses for sale—Four Percheron; three Standard bred road horses; one Morgan; one Cleveland Bay. Address, **Silas Burt, Harper, Kas., Harper Co.**

Extra good imported and home bred **Draft and Coach Stallions** from $800 to $1,400, 2 to 5 years old, including many state fair prize-winners; recorded in U. S. approved books (not recorded grades) and fully warranted. Also **mares and jacks.**
WALKER BROS., Oklahoma City, Okla.

Important Poland China Hog Sale.

Poland Chinas are as staple among hogs as Percherons are among draft horses, and Poland Chinas such as Lee Gross advertises for sale at auction in this issue, are as good breeding stock as can be found wrapped in hog hide. Mr. Gross stands very near the top among Poland China breeders of his territory. This sale—which closes out his breeding herd—includes enough hogs so one can be sure of buying with the money, and good enough hogs so the most particular can find what he wants. Read the ad. The sale will be at St. Joseph, February 12. Address Mr. Gross, Nodaway, Mo., for catalog and mention the American Breeder.

Stallion for Registered Cattle

For sale or trade for registered cattle, Shorthorns preferred, one Brown Imported Percheron Stallion, 5 years old; one 3-year-old bay Shire stallion; good individuals, sound and all right. This stock will be priced to sell.

George Bell, Ackerland, Leavenworth County, Kansas.

DAPPLE GRAY PERCHERON

Stallion, 4 years old; recorded in P. S. A. Sound, good feet, very best action, extra heavy bone, extra good breeder. Weighs 1,850 pounds in fair condition. Price, $800, if sold inside of 30 days.

This offer will not appear again.

R. W. Holt, Beacon, Mahaska Co., Ia.

FULL BLOOD PERCHERON

Stallion, registered and lincensed to do business in the state of Wisconsin. Foaled April 22, 1904. Good style and action. All black, with star and snip white. Broke to drive and work, and a sure foal getter; lots of colts to show. Selling because I have lots of his colts ready to breed and must change horse. For further information, address, **Albert Marcouex, Nekoosa, Wood county, Wisconsin.**

BLACK PERCHERON STALLION

Pedigreed, 8 years old in May. Good action and points. Weight in breeding flesh, 1,800 lbs. Have colts to show he is a good breeder. I desire to change horses so as to breed his colts. There must be others in my fix, not so far away but that we can make a trade, at no great expense. Percheron preferred. Write for particulars. Address **John L. McClellan, Box 235, Rockford, Spokane County, Washington.**

IMPORTED BELGIAN STALLION

For Sale—Name Barnum de Lillois, No. 26118—1605—404, Bay; black mane and tail; foaled the year 1901. Is perfectly sound and weighs 1,950 lbs. A sure foal getter. This horse will be sold very cheap if taken at once. For further information, address **Frank Wing, Cambridge, Henry County, Idaho.**

BELGIANS

Stallions and mares, over 100 head, Jan. 1, 1912. 24th year in business. Write for catalog. **Henry Lefebure, Fairfax, Linn County, Iowa;** 8 miles west of Cedar Rapids.

STALLIONS AND JACKS

For Sale—30 head of good first class Percheron and standard bred stallions, and extra big black jacks, ages from two to six years. All stock sold at reasonable prices and on a guarantee. Terms to suit purchaser. **Fisher & Walker, Evansville, Vanderburg county, Indiana.**

For Sale

A few Percheron and Belgian Stallions and Mares. **W. L. Lake, Ft. Cobb, Caddo County, Oklahoma.**

Priced to Sell

Oscar Edwards & Son of Hillsdale Stock Farm, have some choice saddle stallions and mares. A couple of Percherons, and some of the best jacks and jennets that grow. Show stuff and prospects. Guaranteed to be as represented. They breed Duroc Jerseys, too. Write them. **Box 402, De Soto Jefferson County, Missouri.**

REGISTERED PERCHERON.

PERCHERONS FOR SALE

We are offering an extra choice lot of stallions from 2 to 6 years old. They are the large drafty fellows that the farmers like and the kind the market demands. All stallions recorded, and sold under a written guarantee. Will price them where they will sell and on terms to suit. **Singmaster & Walker, Union Stock Yards, South Omaha, Douglas County, Nebraska.**

Imported Horses $1,000 Each
Home-bred registered Draft Stallions, $300 to $600. All horses warranted sound and sure breeders.
Reference—**Any bank** in Osceola.
HART BROS.,
Osceola, - Iowa.

STALLIONS FOR SALE

Imported Stallions—$800 to $1,000 for your choice. Home bred stallions $250 to $650 each. References, any bank in Creston, Iowa. A Latimer Wilson, Creston, Iowa.

FINE PERCHERON STALLIONS

From coming yearlings to mature horses, at low prices, breeding and quality considered. Have not been fatted and stuffed to injure them, but the younger ones have been out in stalk field all winter. Would take some good jacks as part pay but would accept nothing under 14½ hands, standard measure. **A. J. Robnett & W. B. Lacey, Farina, Illinois.**

MAPLE POINT PERCHERONS
60 HEAD ON HAND
CRANDALL & DANFORTH
RANDOLPH, MINN.

D. B. Kirby, Grain Valley, Missouri, has both jacks and stallions for sale.

Some one can buy a fully equipped stallion barn from Silas Burt, of Harper, Kansas. Read his advertisement.

Jacks and jennets and Percheron stallions are for sale by G. H. Minton, Forest City, Missouri.

Two sons of the $2,810 Limestone Wonder, are included in the jack sale by Chas. Wyatt, Petersburg, Ind.

One of those stallion opportunities we spoke about where a breeder must change his horse for something that can be used on the animal's fillies, is advertised by Peter Johnson, Butka, Nebraska.

G. L. Anderson, Cashion, Oklahoma, has two stallions and a jack for sale.

August Trudeau, Suring, Wisconsin, advertises a prize winning Percheron stallion. Notice his reason for selling.

Over 40 head of registered jacks, stallions and mares are advertised by the Kentucky Sale and Breeding Stables, Fort Smith, Arkansas, in the Kennedy building.

Fruin Bros., Gilman, Ill., are making a price of $800 on a Percheron stallion if sold soon.

LAMER'S HORSES SOLD WELL.

C. W. Lamer of Salina, Kas., held a well attended sale of draft stallions and mares in December. About 10 head of imported horses were included in this sale, the remainder being home bred stock. The top price for one animal was $2,000, which A. Schafer of McPherson, Kas., paid for Joliet (85532) 80535, an imported Percheron stallion. The next highest price was paid by G. I. Fitchpatrick of Cedron, Kas., for Perro 19226, an American bred horse. The highest price for a mare was $565, paid by H. A. Jones of Hartley, Kas. Among other purchasers were: Cantwell Bros., Sterling, Kas.; H. A. Knopp, Chapman, Kas; Ray Jones, McPherson, Kas.; George Stites, Hope, Kas.; E. J. Schippel, Salina, Kas.; David Megli, Glen Elder, Kas.; O. F. Berg, Pratt, Kas.; George Gebhart, Salina, Kas.; J. L. Swanson, McPherson, Kas.; Kelly Allen, Abilene, Kas.; Rudolph Svitak, Lincolnville, Kas.; Fred Haupt, Salina, Kas.; W. J. Iles, Marysville, Kas.; Barney Carr, Cullison, Kas.; F. B. Delker, Woodbine, Kas.; W. H. Cottingham, McPherson, Kas.; C. E. McFadden, Natoma, Kas.; S. T. Fordice, Norton, Kas.; T. J. Roberts, Kit Carson, Col.; A. W. Wilson, Fairfield, Mo.; James Haley, Hope, Kas.

Common sense teaches us that a mature sow will produce larger and more perfect pigs than a young one.

Any hog will certainly thrive better if they have clean feed and decent surroundings than if they have to live in filth.

PRIZE WINNING STALLION

A registered black Percheron stallion, weight 1,750, not fat; first prize winner in this county; also his colts. clean boned and good worker. Girts 7 feet 7 inches. Sure foal getter. My reason for selling, I am too old to handle a horse and tired of the business. Price, $550. Come quick or he will be gone. **August Trudeau, Suring, Oconto County, Wisconsin.**

Well Bred Percheron Stallion

Two years old, very dark gray, silver mane and tail; weight, 1,820 lbs. Traces through sire to Besique (19602), through dam to Voltaire, 3540 (443), an extra good individual, right in every way. Price $800, if taken soon. **Fruin Bros., Gilman, Iroquois County, Ill.**

Black PERCHERON STALLION

Fifteen-sixteenths full blood; 9 years old, weight a ton in good condition. Sound and sure breeder; stood him here for seven years reason for selling, or will trade for a pair of Belgian fillies; must be registered. Will pay difference.

A. W. Haase, Fenton, Kossuth Co., Ia.

REGISTERED PERCHERONS.

Would trade some for Angus or Polled Durham cattle. One work and brood mare, weight 1,900 lbs., with foal by first class Imported horse. One coming 2-year-old filly, will make over a tone mare; one coming 2-year-old stallion, will make a ton horse. This stock is of the big, rugged, heavy boned kind; all black, bred, registered and priced right. Will sell one or all. **Lewis F. Newbold, Minden, Kearney County, Nebraska, R. 4.**

REGISTERED PERCHERON STALLIONS

ranging in age from 3 to 7 years, weighing from 1,800 to 2,240 lbs.; one dark iron gray 3 years old. One coming 3 very high grade, dark chestnut. All are heavy boned, sound and guaranteed breeders.

C. Satorius, Wynot, Cedar Co., Neb.

PERCHERONS TO EXCHANGE

Or sell, as I need a new stallion that I can use on his fillies—the registered Percheron stallion, Tiger 44723 (Percheron Society of America); weight, 1,800 pounds; dapple gray; seven years old; good ends and a good middle; good bone and feet. Great action, sound, sure and stylish.

Peter Johnson, Butka, Rock Co., Neb.

Percherons, Belgian, German Coach stallions and mares, all ages, imported and home bred and hard to beat. Prices reasonable; terms to suit; 70 head to select from. **A. R. Ives, Delavan, Walworth County, Wisconsin.**

Black Percheron

For Sale or Trade. I have a nice black Percheron stallion, 5 years old, that I will sell or exchange for a good young saddle or roadster stallion—saddler preferred. **L. L. Brown, Childers, Nowata County, Oklahoma,**

TWO IMPORTED STALLIONS

Shire and Percheron, 6 and 7 years old. One home-bred Shire, 3 years old. All sound, high quality. **James Auld, Wakefield, Clay County, Kansas.**

PERCHERONS TO EXCHANGE

Two good registered Percheron stallions to sell or exchange, 7 and 14 years old. Fillies to breed; must change. Neither one ever hurt. Good breeders, colts to show. 1,600 and 1,900 pounds, medium flesh. **John Hund, Paxico, Wabaunsee County, Kansas.**

THREE SHIRE STALLIONS FOR SALE

One yearling, 1 four-year-old, 1 six-year-old. Last two registered and licensed. **G. A. Tallmadge, Madison, Lake County, South Dakota.**

STALLION AND JACK

Lew W. Cochran, Crawfordsville, Montgomery County, Indiana.

PUBLIC SALE

25 Head

Of fancy Saddle bred and Registered Saddle Horses, and Mammoth Jacks and Jennets,

FEBRUARY 17, 1912

1-2 mile west of city limits, Excelsior Springs, Missouri, at

Breezy Point Stock Farm

Three coming 4-year-old jacks in sale. Blacks, light points, near 16 hands. I don't think the world can beat them. Also two 5-year-olds that are good, and one yearling colt, extra. If you want to get blood that produces the largest mules in the world here is your opportunity—from demonstrated facts I make the assertion. I owned King Mammoth, the sire of Missouri Queen, weight 2200 pounds, the largest mule on record. King Mammoth also sired a jack that at 2 years old sold for $2,000, Giant King. This jack sired a mule that a 2 years old sold for $300, and at maturity will be as large as Missouri Queen. Four jacks in sale by this young jack. Horse and stallion colts. One 5 years old, good as the best. Two mare colts, extra. Also one yearling, one 3 years old, three brood mares. All black except one by the gerat Rex Donnell 2042. Other noted sirss. Jennets, two of them are great jack producers. One extra good 2-year-old. One colt. Thirty-five years a breeder, and I raised them to sell. All of young stock bred by me.

Dr. W. E. Cheatham,

Excelsior Springs, Clay County, Mo.

CLOSING OUT SALE

FEBRUARY 14

1 Imported Shire stallion, 1 Percheron stallion, 1 Imported German Coach stallion, 10 Clydesdale stallions; 4 Clydesdale mares, heavy in foal, weighing from 1700 to 1900 lbs; 3 Clydesdale fillies; all are recorded.

And my entire flock of horned Dorset sheep; 1 imported ram, yearling. Rams and ram lambs and ewes with lambs at side. Cattle, hogs and farming implements.

GEO. W. BAKER, Milton, Wayne County, Indiana

RHEA BROS.

PERCHERONS

We exhibited fourteen Percherons at the late Nebraska State Fair and won 17 prizes, as follows: One silver medal, one championship, seven firsts, two seconds, three thirds and three fourths. Now, remember that we showed our home bred horses in the same classes with the imported stallions and won **First every time**, bar one. So much for the show. The important thing to be considered is "how does the whole lot show up?" and that is exactly where we are strong. Our two-year-olds, some of them still in the pasture, weigh from 1,600 pounds to 1,900 pounds. These weights guaranteed.

We always claimed to have the big boned kind, and this season we are sure we have better bone than ever, cleaner joints and better feet.

Don't lose sight of how we raise these colts, in the pastures winter and summer, until coming three-year-olds. That's why they are hardy and prove breeders from the start.

Our horses are acclimated, its importance cannot be over estimated. We have stallions coming two, three, four and a few older ones for sale at prices that are very reasonable. Every stallion sold under a full guarantee; can furnish life insurance for two-thirds value at cost.

Write for pictures, descriptions, prices and any information you may want.

Arlington is on the main line of the C. & N. W. R. R. 28 miles northwest of Omaha, 8 miles east of Fremont and 55 miles north of Lincoln. Twelve passenger trains daily.

Arlington, Nebr.

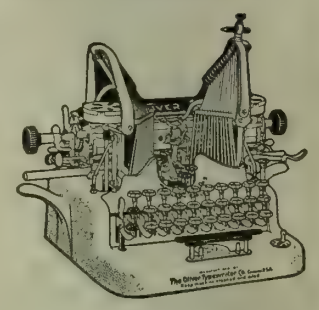
"17 Cents a Day"



The Plan that Promotes Success

The "17-Cents-a-Day" Plan of purchasing The Oliver Typewriter means more than promoting sales of this wonderful writing machine. This plan is a positive and powerful factor in promoting the success of all who avail themselves of its benefits.

It means that this Company is giving practical assistance to earnest people everywhere by supplying them—for pennies—with the best typewriter in the world.

The "17-Cents-a-Day" Plan is directly in line with the present-day movement to substitute typewriting for handwriting in business correspondence.

Ownership of The Oliver Typewriter is fast becoming one of the essentials of success.

"17 Cents a Day" and The

Printype OLIVER Typewriter

The Standard Visible Writer

There is no patent on the "17-Cents-a-Day" Purchase Plan.

We invented it and presented it to the public, with our compliments.

The "17-Cents--Day" Plan leaves no excuse for writing in primitive longhand. We have made it so easy to own The Oliver Typewriter that there's no need even to rent one.

"Just say "17 Cents a Day"—save your pennies—and soon the machine is yours!

The Oliver Typewriter is selling by thousands for 17 Cents a Day.

When even the School Children are buying machines on this simple, practical Plan, don't you think it is time for you to get an Oliver Typewriter.

17 Cents a Day Buys Newest Model

We sell the new Oliver Typewriter No. 5 for 17 Cents a Day.

We guarantee our No. 5 to be absolutely our best model.

The same machine that the great corporations use.

Their dollars cannot buy a better machine than you can for pennies.

The Oliver Typewriter No. 5 has many great conveniences not found on other machines.

We even supply it equipped to write the wonderful new PRINTYPE—for 17 Cents a Day.

Make the Machine Pay Its Cost

The Oliver Typewriter is a money-making machine. It helps "big business" pile up huge profits.

Tens of thousands of people rely on The Oliver Typewriter for their very bread and butter.

A small first payment puts the machine in your possession.

Then you can make it earn the money to meet the little payments.

If you are running a business of your own, use The Oliver Typewriter and make the business grow.

If you want to get a start in business, use The Oliver Typewriter as a battering-ram to force your way in!

The ability to operate The Oliver Typewriter is placing young people in good positions every day.

Get The Oliver Typewriter—on the "17-Cents-a-Day" Plan—it will help you win success.

Ask About "The Easy Way"

to secure the newest model Oliver Typewriter No. 5. The Art Catalog and full particulars of the "17-Cents-a-Day" Purchase Plan will be sent promptly on request. Address

Barrenness in the Cattle Herd

A Discussion of Causes; How They May be Detected. Possibilities and Means of Remedial Treatment and Cautions to be Observed.

By Frank B. Graham, Editor.

ONE of the difficulties attending the production of live stock of any kind is the failure of some animals kept for breeding purposes to become regular producers. This fact is not observed so much among cows as among mares, for if a cow does not produce for a year or two, she is usually fattened and sold for beef. Generally speaking, this is the best method of disposing of ordinary or cheap cows, but should a breeder own an animal of great monetary value on account of her individual worth or excellent lineage he would be very loth to part with her at market value, rated at so much per pound.

The subject of barrenness in animals has not been given the careful study and attention it deserves, and this statement particularly applies to cows. There is no good reason why many of these valuable animals should not be made regular breeders, but the problem carries with it a careful consideration of the causes of sterility which frequently necessitates expert knowledge to determine, then the cause is first determined, then the problem is more than half solved, for the main point then becomes—can the cause be remedied? Many of the animals are amenable to treatment, and can by a little thought as to care and proper treatment be made regular producers

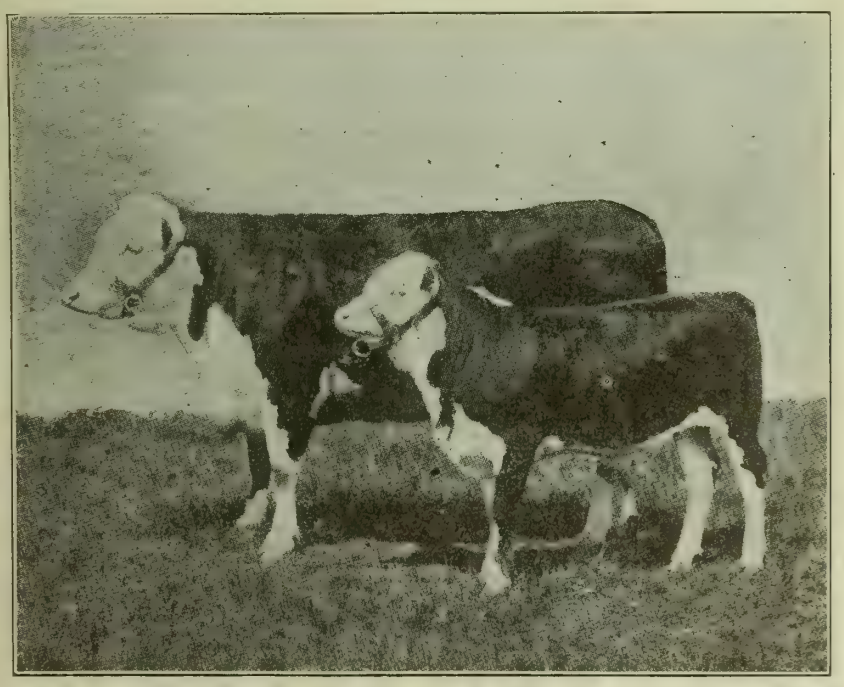
During the past year the writer has given considerable time to, and made a special study of, the subject of barren mares and cows, in order that he might be of the greatest possible service to the American breeders. Working in conjunction with several of the best veterinarians of the country, over a thousand barren mares have been examined with the result that we believe that from among the multitude of organisms found in the various parts of the generative tract, we have been able to isolate a particular variety that is responsible for a great percentage of the sterility in these animals.

About one hundred cows, of different breeding ages, have been dissected for the purpose of finding out the exact condition of the generative organs. Some highly interesting findings have attended this particular line of study, and it is expected that this branch of the investigations will continue from time to time. The investigations have extended to several herds, but inasmuch as breeders are inclined to send sterile animals to the shambles, it has not been possible to find many barren cows. I am planning a visit to a greater number of herds this season, and hope to attain more valuable knowledge and data on this much neglected subject.

We are already convinced that much trouble comes from permitting the bull to serve cows promiscuously, breeding cows known to be more or less diseased, etc. The practice of allowing the bull to run with a herd of cows invites the spread of disease of the generative tract with subsequent sterility, through the act of copulation. An infected bull, like an infected stallion, can bring no end of loss to an individual or community.

The breeder of the show stock is already familiar with the pernicious effect that excessive fat has on the reproductive organs. Much can be done to counteract the harmful influence of high conditions by insisting on plenty of exercise and breeding the animal before the danger point is reached.

While the generative organs of the cow resemble those of a mare in a general way, yet there are important points of difference, one of which we believe worthy of mention. The cervical canal or passageway, through which the vagina communicates with the uterus is very long and tortuous. When the cow is not in heat, this canal is closed so tightly that it is only with great difficulty that it can be opened by manual effort. The investing muscular fibers exert a contracting force that is hard to overcome, and they force the mucous membrane lining of the canal so closely in contact, that it is difficult even to introduce the smallest probe into the uterus.



During estrum (heat) the parts are more usually relaxed, and by careful manipulation the index and sometimes two fingers may be introduced without undue irritation to the animal. For the above reason it is not usually advisable to undertake more than a superficial examination of the parts, unless the animal is in heat, and then it should be done with the greatest care regarding cleanliness of everything pertaining to the task as well as gentleness in manipulating the parts.

If it is found needful to resort to various sized probes as employed by human specialists it will be necessary to introduce one hand into the rectum for the purpose of securing the cervix through the rectal walls in order that the smallest probe may be directed through the canal. On account of the tortuous character of the latter and the voluminous folds of the mucous membrane lining it, the probe is inclined to catch in the same and cause hinderance.

No positive force should be resorted to lest a puncture result, which might give rise to serious complications. Should one succeed in passing the probe through the canal it then becomes easy to repeat with graded sizes until the parts have been dilated to a point where spermatozoa may be introduced by mechanical means.

One should be in no hurry in this work, but should give time for muscular relaxation after each probe has been inserted.

These measures are particularly applicable to those cases wherein the cervix has undergone stricture from the effect of disease or from laceration attending calving, the parts having become closed as a result of the formation and contraction of sear tissue. It is far safer to delegate the work of this character to a competent graduate veterinarian where valuable animals are to be treated, rather than take the chances on doing irreparable injury by one not schooled in the anatomy of the parts. The same remark will apply to the treatment of many phases of sterility and we believe the knowledge possessed by men trained in these particular lines should be utilized in solving these intricate problems.

HEREFORD COW, STERILE FROM A DISEASED OVARY, WHICH BECAME A PRODUCER AFTER ONE OVARY WAS REMOVED.

The losses that come to the breeders of pure bred cattle annually on account of barrenness are enormous, inasmuch as a non-producer is a dead expense. She entails even a greater loss to the owner than the sterile mare, for the latter may partly pay her way in service.

A second distinction in the cow, contrasted with the mare is the manner in which the placental membrane is attached to the uterine wall. In the cow the attachment is through raised tufts or so called buttons and in the mare the attachment is uniform and diffuse. The envelopes in the cow appear to be more securely attached and are more difficult to remove when retained. Their retention often provokes disease of the uterus itself and frequently leads to general systemic disturbance through absorption of poisonous substances developed through putrefaction. Every breeder of cattle is familiar with the conditions attending the neglect or improper removal of a retained placenta (afterbirth), and of the difficulties encountered in attempting to properly disinfect the parts subsequently. An acute inflammation of the uterus may be a sequel of such retention, leaving behind, should the animal recover, a mucous membrane so altered in structure as a result of the disease, that for some time after all signs of disease has disappeared it fails to perform its function by not attaching to its walls the passing fecundated ovum.

The pressure of putrefying membranes may only induce a slight catarrhal condition of the uterine mucous membranes, hardly noticeable, with similar results to those alluded to above. There may be serious infection with pus producing organisms resulting in a profuse discharge of offensive material, or abscesses may form in the walls of the organ or along the course of the fallopian tubes or even in other parts of the body. A retained placenta is a serious menace to the general health and well being of any female and militates greatly against the future usefulness of it as a breeding animal. On account of its presence being harmful it should be removed ordinarily at the expiration of twenty-four hours after the birth of the calf. At this period the blood vessels supplying it have diminished in size and the attachments as well have become less firm, making its removal less dangerous on account of hemorrhage, as well as easier. If one delays much beyond this period, it will be found that the os uteri has contracted to a point where it interferes with the introduction of the hand into the uterus which is necessary to facilitate its removal. The same care as to cleanliness, so as to guard against infection of the parts should be insisted on as in all explorations of these parts, and in the event of a retained placenta one should be doubly careful. No violence should be resorted to, but the foreign substance should be carefully distinguished from the uterus wall and gradually separated from the same. Inasmuch as the placenta is inclined to become torn one needs to search diligently and remove every little portion.

In the final cleaning up process, the detecting of these small shreds

and parts can be made more readily by irrigating the uterus with a hot saline solution at a temperature of 105 degrees fahrenheit. This solution should be prepared by boiling water in a clean vessel to which a tablespoonful of table salt to every gallon of water has been added. When thus prepared it should be set aside and be permitted to cool to the above temperature. One careful irrigation, by means of a one-half inch rubber tube, to which an ordinary funnel has been attached for the purpose of aiding in pouring the solution through the tube is usually all that is required. The better practice is to very carefully clean up thoroughly at this time, and not molest the parts afterwards so long as appearances indicate proper recovery. One should exercise proper care and not permit the introduction of air through the irrigating tube for the reason that it may prove harmful.

The reaction of the secretions of the vaginal tract as to acidity or alkalinity should always be determined in doubtful breeders, and a satisfactory test may be made on this point with litmus paper. If a small piece of the blue paper is placed in contact with the anterior vaginal wall and does not change color, conditions are normal so far as reaction is concerned. If, however, the paper should turn to a reddish tint, the parts are sufficiently acid to jeopardize the lives of the spermatozoa. To correct this condition, hot irrigations above alluded to may be employed, or a solution of bicarbonate of soda prepared in the same manner may be alternated with the saline fluid.

Other conditions favoring irrigations in the female are the various disorders of the ovaries—those glands which develop the female cell or ovum. These glands are inclined to become inactive with advancing years and ultimately cease their functions altogether. This fact is not of very frequent occurrence in the cow for the reason that she is rarely kept to extreme old age. Sometimes this suspension of functions is premature and an animal ceases breeding years before she normally should. Loss of activity in this manner is difficult to anticipate, and still harder to correct. The ovaries may be the seat of various types of tumors or may have developments of cystic nature on their surface or within their substance.

The pressure of these abnormalities frequently influence greatly the temperature of the animal and is chiefly responsible for the vicious bulling cows as well as other irregularities associated with estrum. These abnormalities may be detected by making a rectal examination and manipulating the parts through the rectal walls. In order for one to become familiar with the location, size and general arrangement of the ovaries, he should examine first a normal cow. Should it be found that both ovaries are involved in disease, as evidenced by undue enlargement or raised places on their surface, it is not likely that anything can be done to restore breeding in such an animal, but should only one of the glands be found affected it may be removed by a competent surgeon, thus dispensing with its evil influence, on not only the general temperament of the animal, but upon the remaining sound ovary. If such surgical measures are thought to be advisable a careful manual examination of all the accessible generative organs should be made while the opportunity offers. specially should the course of the Fallopian tubes be felt over for obstruction, which in these minute ducts might be so small as to be very difficult to detect by any method. Properly applied massage to the generative organs stimulates activity in the same, and it would be well to resort to this measure also at this time.

(Continued on page 10.)

Why Growing Out Is Essential

Full Development of All Young Things Vastly Increases the Likelihood of Selecting the Best Animals for Reproduction. Cultivation of Good Qualities Thought to Facilitate Their Reproduction.

Written for the American Breeder by Prof. Ellis Rail, Department of Animal Husbandry, Nebraska Agricultural College.

IF we were asked to define animal breeding, we might say, it is that science which treats of the reproduction and improvements of animals. Such a definition indicates that here are two phases of the subject. One is that of reproduction itself and would deal primarily with the essentials of all that pertains biologically to such. The other is that dealing with methods of developing animal life that has been reproduced, and of such sorting, mating and care that future generations of similar animals would show a gradual change toward a desired end.

We wish to discuss in this article one of the things which it seems to us is very important for every man to undrestand who breeds live stock, and who wishes to improve the same. This is the necessity of fully developing all the young that are produced, or in other words to give every youngster produced a chance to make the very best of itself. In every young animal of desirable breeding there are a lot of potentialities. In many cases these potentialities are never developed, or at most are not given more than half a chance to become working factors. And what are the results? Briefly stated they really amount to this: Many animals of superior merit, both as to ancestry or blood lines and also as to potential possibilities, reach the age of maturity showing such poor individuality at that time that animals of much inferior breeding and animals which at birth were much inferior in individuality are selected over them to use for further breeding work. And what is the result of such practices? Only one thing can happen, and that is a gradual deterioration of the flock or herd which is being so managed.

Let us illustrate a little more fully the way this works, for we want to get well established at first, just what we are talking about. All of us have known of individual men who have become at some time ambitious to breed some class of pure bred live stock; and having some financial means to gratify such a wish they have set out at once to do so. A good foundation herd was secured and a sire of recognized individuality placed at the head of it. This being done the owner has imagined he was going to be a great breeder of that particular class of animals. But not very careful attention was given to getting ready for the young things the herd produced, and they were not developed out any better than ordinary stuff would be. At maturity they were not desirable in individuality as was the foundation stuff, or at least not enough of the young things were of that type to replace what it was already time for discarding from the original draft. So, instead of keeping up an increasing the foundation herd from its own produce, the owner again goes out to buy, and he finds animals for sale which are at the time showing superior individuality to those he has raised himself, but which are so, simply because the man who raised them made of them everything they were capable of becoming. They were not as well bred, nor at birth of as desirable kinds as the buyer had produced by his own herd, but nevertheless he replenishes his herd from such material and after repeating the process a few years he finds himself with a herd much poorer in character than was his foundation draft. He has failed in his ambition, and more than that he has retarded the progress of live stock improvement by using animals himself not of the best and also by allowing animals that were worth while to become unfit for use.

Now let us see if we can, of just how much importance this point is in our animal breeding work. We might best consider it first as to its direct effect upon succeeding offspring, and it is but fair to state here that such a consideration must be more theoretical than otherwise, for our most learned men have been unable to agree or to learn just how much any one generation has to do with the control of the characters of the succeeding generation. But whether we believe in Darwin's theory of "pangenesis," thereby making the individual the altogether important factor in mating, or whether we adhere to Weismann's theory of "The continuity of the germ plasm," and thereby lay great stress on pedigree, it seems to the writer that there is a plausible and practical point to consider. To set forth that point is the main purpose of this article.

We have a good deal of respect for Weismann's theory of continuity of characters because characters are the determining factors which mark off and determine classes. But taken without any degree of latitude it doesn't allow very much for successive improvement from generation to generation. Now, the more we look into the question, the more we are convinced that the practical working basis of the situation is to consider that any given breed, let us say, is made of a particular set of characters, of all of which each animal possesses some increment. Now, of necessity, some of these characters are desirable but some are not. Our way of working with these would be based on the suggestion that if the desirable characters are given opportunity they are capable of reaching a maximum degre of development in any one generation, also the undesirable characters may be reduced to a minimum. If this be done, it seems reasonable that if animals are mated, both of which have been developed to the maximum as regards the desired characters, the resulting offspring may have a potential maximum for the development of the good characters, of a higher degree than had its parents. Then if it be fully developed and mated with another which has been equally developed, the offspring again reaps the advantage and gains a slightly higher possibility.

Reduced to a simple statement, this theory simply is the common one that the oft-repeated doing of anything makes it more easy of performance, and also that this repetition makes for a greater degree of perfection. An illustration of this idea may be drawn from our beef cattle. The tendency toward beefiness is the most desirable characteristics of this group of animals. They all possess this character in some degree, and they always did have some capacity for meat production. Bnt the development of this character to a higher degree in some animals more than in others, and the use of their offspring, and so on for many generations, has made it comparatively easy for any well bred animal of our beef breeds to grow a body of most desirable beef propensities. But it is possible to keep up this high degree of beef producing ability by keeping our animals fed up as well as bred up to a certain standard. But, says some one at this point, improvement along any line then, simply consists in mating animals of each generation that have had full development of certain desirable characters? If that was all, the problems of breeding and of improvement would be comparatively simple indeed, for all we would have to do would be to make the proverbial corn-crib cross, and success would follow.

Now, as we have explained above, we believe that the act of fully developing any characters or set of characters from generation to generation, makes it easier for the same to be fully developed in each succeeding generation, and also makes possible some advancement with each successive reproduction. Also, if this be true, it is just as logical to conclude that characters of undesirable type may be minimized from generation to generation by repressing them as much as possible each time. But whether or not this is the way in which advancement in improvement takes place, there is another very practical phase to this matter of full development that we believe is indisputable, and is perhaps the greatest reason why every one of the young of any generation should be made the most of that it is possible to make.

One of the four chief principles along which Bakewell (the father of modern practices of breeding) worked, was like produced like, or rather that the best animals were produced from the best parents. Amos Cruickshank, the "Sage of Sittyton," who was past master of breeding, stated as the epitome of his ideas that "thick fleshed cattle produced thick fleshed cattle." This was essentially the same doctrine that Bakewell held. Modern study and recent investigations tend to show that this principle of like begetting like, is only very relative, and we have read some men's views who were inclined to minimize if not even sneer at the idea being worth consideration. But after all it is the fundamental stepping stone to success, for if like does not produce like, then where will we get anything like we want. Of course variation is due oftener to lack of development than to actual hereditary influence.

Now, what relation to the necessity of full development has all this discussion about the above mentioned principle? Our points is this—that unless animals are as fully and as perfectly developed as possible, it is a difficult, if not an impossible, matter to obtain the best of what is produced. No one advances the quality of his animals any too rapidly, if he is successful in selecting each year the best of the young that were produced. How then can the man who does not fully bring out all the possibilities of the young things expect to keep pace in his breeding work with the breeder who does? It is a common remark that none of the shrewdest breeders or judges can certainly tell how a young, immature animal will certainly develop. Championship honors in breeding classes competed for between young, undeveloped specimens and mature ones always go to the older animals unless the younger is outstanding, because, says the careful and discriminating judge, you know what the aged animal is and the young competitor may not after all make the mature specimen you expect it to. Shall we then use less care in selecting our breeding animals than does the prudent judge in awarding premiums? We have often suspected that the success of many of our most expert breeders and improvers; men whose judgment is sought after as to the merits of certain prospective purchases for breeding sires and dams, was due largely to the fact that of the young animals produced on their farms all were given ample opportunity to indicate if not to show fully, what possibilities they inherited and thus the matter of selecting out the best was not guess work, but was based on actual merit shown. In other words the best was actually selected because environment and care were furnished sufficient to let each

individual demonstrate its relative value.

The matter of full development then, has at least two important phases in its relation to the improvement of our domestic animals. One is the possible and probable relation it has to the transmitting powers of the animals—that is whether or not the full development of animals of each generation does not make for the more certain transmission of these desirable characters to a more marked degree in the offspring, and thus show an improvement from generation to generation. The other is the aid full development gives to the process of selection, thereby making possible more certain and sure selection of what is desired. It is this latter point that we consider of the greatest importance; for if men who go into the business of animal breeding, or who are in the business, will give the young things the opportunity they ought to have, there will be much more real discretion used in selecting, and much oftener will the best animals be used for the continuation and improvement of the herd.

THE "TEST COST" JOKER.

So often has the prosecution of the so-called packing trust come to a temporary close without results, that a great many people have begun to doubt the legitimacy of many of the charges made against this much discussed institution. The latest effort on the part of the government attorneys, therefore, was not looked upon with any great degree of seriousness by the majority of the stock men among the news reading public. Hence it came as a surprise when the government prosecutors produced evidence which seemed to indicate a deliberate falsification of the so-called "test cost" of slaughtering, on which has been based practically all the assertions that the packing business was only moderately profitable. According to the government representatives and witnesses, the test cost for slaughtering was often secured without allowing any credit for the sale of the hides. In one case it was alleged that for a series of days in the plant of Morris & Company an allowance of $55,776 was made for hides, when the books of the company showed that the hides amounted to $112,834. Against the same company it was alleged that a customary allowance of $3.60 per head for hides was discontinued entirely from November 1907, to April, 1909. This necessarily greatly increased the test cost of slaughter, and made it possible to conceal the evidently very large profits which the business was making. In other cases the following figures were introduced for separate months, showing the credit for hides allowed in securing test cost of slaughter and the money actually received from the sale of all hides during the same month, viz: credit, $153.02; received, $223,824; credit, $215.02; received, $278,960; credit, $212.16; received, $150,663.

There was much more along this line, some of which the packers have already introduced evidence to contradict. The point to be emphasized in giving this much space to the matter before the outcome is determined, is that there are several kinks in the packing business of which the general public has never dreamed. Many people have warmly defended the packers and upbraided the government and all others who spoke ill of them, on the supposition that the test cost of slaughter which the packers gave out themselves was an absolutely honest, accurate ground for basis of judgment. Now that it has been alleged and seemingly proven that in securing this test cost one great item alone was omitted, (an item sufficient to more than pay for all the expenses of slaughter) the revision of opinion will have to be general and radical. And what the prosecution has not brought out, concerning the inside workings of the packing companies, might, itself, in all probability, fill a good sized volume.

Beef Cattle in the South

How the Boll Weevil is Proving, to Some Sections, a Blessing in Disguise. Bermuda Grass and Cottonseed Meal As Aids to Beef Production and Fertility Maintenance.

Written for the American Breeder by Prof. C. A. Willson, Animal Husbandman, Tennessee Experiment Station.

THE Mississippi Basin states have been developed, the Rocky Mountain states have been exploited, the Pacific Coast states are being rapidly advanced; but along agricultural lines, the Southern states are attracting the most attention and are receiving the greatest impetus.

Because of its climate and its natural resources the South is destined to become one of the greatest agricultural sections of the United States. It can produce greater variety of crops and more of them than any other portion of this great country. Since the advent of cheap labor in the South its agriculture has been characterized as cotton farming, and only upon the arrival of the boll weevil has much attention been given to other kinds of agriculture. The principal factors that will determine the development of agriculture in the south are: First, the advancement of the boll weevil; second, the overproduction of cotton, and third, the need of greater diversity in agriculture in order to preserve and increase soil fertility.

The steady advance of the weevil from Texas eastward has been spelling disaster to the cotton crop in its wake. From 1899 to 1903 the eastern portion of Texas produced 24 per cent and the western portion produced 19 per cent of the cotton crop of that state; but after the arrival of the overproduction of cotton in this country. The supply is meeting the demand, as indicated by production and prices for the last two or three years. The cotton production of the United States for the year 1905 was 10,575,017 bales; for 1907, was 11,107,179 bales; for 1910, was 11,426,000 bales. The total world production for the same length of time has also remained equally as constant. The South is producing 63 per cent of the world's cotton, upon only 14.4 per cent of its total area. Of the remaining farm area 30.6 per cent is improved, while 55 per cent lies as yet unimproved. Furthermore, of the 30.6 per cent improved land (the improved land not used for cotton), many thousands of acres lie idle each year. These thousands of improved acres, not used each year for corn or cotton production, if sown to Bermuda grass and grazed by cattle, would bring a return to the Southern farmer of millions of dollars. What might further be accomplished by using the now waste lands for similar purposes is, indeed, difficult to conceive.

Along with the boll weevil and overproduction of cotton, soil depletion is forcing the Southern farmer to crop rotation. The effect of rotation of crops and foraging upon the land has been shown by the Arkansas Station in bulletin 68. Cowpeas were sown in

CLASS OF FEEDERS BEING USED AT TENNESSEE EXPERIMENT STATION.

weevil, from 1903 to 1909, the eastern portion produced 16 per cent and the western portion, which was unaffected, produced 29 per cent of the cotton crop of Texas. In many places, because of the failure of the cotton crop and because of the inaptitude of the farmers in the wevil section to adapt themselves to the new conditions and produce other crops, the cotton farms have been temporarily greatly depreciated in value. At the present time the weevil has advanced so as to cover a large portion of Texas and Oklahoma, all of Louisiana, a large portion of Mississippi and Arkansas, and a small portion of Alabama and Florida. The farmer who is able to adapt himself to the new conditions when the boll weevil arrives in his locality, will find that his enemy may become his friend through forcing upon him an advanced system of agriculture that will preserve his soil fertility and which may even produce greater returns per acre. The boll weevil is teaching the southern farmer better systems of agriculture with greater diversity.

Another important factor that will tend toward diversified farming, and with it the development of the beef cattle industry in the South, is the corn and at time of harvesting the corn was gathered and the cowpeas and stalks grazed by steers. The effect upon the succeeding cotton crop, through grazing the cowpeas and stalks, was an increase of 626.5 pounds of seed cotton as compared with the production of another equal area of ground where corn alone was grown and harvested and the stalks unforaged. Another equal area that had been planted to cowpeas and corn was planted the succeeding year to corn, and the increase in the corn production, due to the cowpea crop and grazing, was found to be 14 bushels per acre. Grazing of farm crops and grasses will bring added returns to the farm by utilizing wastes, preserve the soil fertility, and result in increased crop production.

The livestock production of the Southern states has kept pace with their corn production, as has been true with the Northern states. With increased corn production will come increased cattle production. That the South can produce as large or larger crops of corn than the North has been proven many times by the boys' corn clubs of the South during the last four or five years, through the extraordinary crops of corn produced by them. That the South is capable of producing larger crops of corn than other parts of the country has been clearly shown by Voorhees of Tennessee, in his bulletin on "Relation of Temperature and Rainfall to Crop Systems and Production." Forty per cent of the effective growing temperature of the South occurs during those months when plants make no growth in the North. The climate of both summer and winter favor larger crop production than in the North, and therefore more economical livestock production. For the past three years the West Tennessee Experiment station at Jackson, Tennessee, has fed from 60 to 100 head of steers each year in the open, and has secured equally as good gains as with steers fed under cover. This is an economical system in every way; not only is there a saving in the cost of shelter, but the expense of hauling the manure is obviated by the manure being distributed upon the land where it is desired. The many advantages in beef production in the South over beef production in the North are obvious.

The cattle feeding industry in the South is in its infancy, but with the foodstuffs which it has at hand, such as cottonseed meal, and its cheap forages, it can compete very advantageously with the cattle feeding industry of any section of this country. The one thing that is most needful in the South today is a greater utilization of the cheap feeds now on hand. Cottonseed meal, instead of being allowed to leave the South, thus removing thousands of dollars worth of fertility each year, should be fed in the South, and thus the fertility of the soil is retained. A ton of cottonseed meal when fed to beef cattle on the ground where it is desired to have the manure, will return to the soil about $22 worth of fertility, at present prices of fertilizing constituents. This return for the cottonseed meal is entirely aside from its food value. When fed to steers in connection with silage it may have a value for feeding purposes, when steers are worth six cents per pound, of from $35 to $50 per ton. Where it is desired to increase the fertility of the soil, cottonseed meal may be worth, then, for cattle feeding from $57 to $72 per ton. Many Southern farmers who have not the capital for steer feeding, but who realize the importance of adding fertility to their soil in this manner, are doing all the work, incident to steer feeding, for men with capital who furnish the steers and the feed. The Tennessee Experiment station in bulletin 79, has shown that, after accounting for cost of labor in the production and the feeding, an acre of corn would return a profit of $13.72, an acre of soybeans $23.95, and an acre of cowpeas $19.35, when fed to steers. In continuation of the same experiment through the year 1910, an acre of soybeans, produced, when fed to steers, 609 pounds of gain, an acre of cowpeas 441 pounds, an acre of corn 708 pounds, and an acre of alfalfa 765 pounds. When the gains produced are worth five cents per pound the returns per acre of crops fed on the farm to beef steers may be from $20 to $40. This system of farm management gives the greatest ultimate returns per acre because of a minimum loss in soil fertility.

In considering beef production in the South, the ready market must not be overlooked. The South has its own market, but as yet it is producing but a small portion of the meat that her people consume. Gray and Ward in Alabama bulletin 150, state that "If no outside meats were shipped into Alabama the supply of meat in that state would be quite inadequate for the needs of the people." The rapid industrial development of the South is increasing this deficiency from year to year. With climatic conditions, feedstuffs, and cheap forages all favorable to economic production and hence larger returns, it is hoped that the farmers of the South will realize their opportunity and meet the demands.

Things Cattle Experiences Teach

The Finished Herd Which Attracts Men to the Business is Built Only by Careful Study and Attention, Based on a Love of Good Animals. Some Points This Includes.

Written for the American Breeder By Prof. E. A. Trowbridge, Columbia, Mo., Missouri College of Agriculture.

THE accumulation, development and maintenance of a high class herd of beef cattle seems to the experienced, to be not a difficult task. To observe the breeding cows, bulls, and young stock of a good herd on a luxuriant blue grass pasture and in the best of health, gives one only an insight into the results, and not the cause. Indeed, too many men have decided to engage in the cattle breeding business after observing only the gratifying results of others, and without the knowledge of the effort and skill necessary to arrive at success. In most cases the men who have accomplished the greatest results are those who have been successful only after more or less discouragement. Unless a high level of the business has been attained, and even though it requires constant management and painstaking care to maintain such a level, the experience gained in its attainment is always valuable and of constant service in self-maintenance. There are many cattle breeders in the Corn Belt today who have reached well toward the goal in the breeding world. There are others who hope to arrive at success but as yet have not overcome some of the more important obstacles which impede their progress. No small degree of the ultimate attainment of any breeder is due to the care and management of the herd and this factor is frequently the difference between failure and success.

The inexperienced man whose enthusiasm and judgment lead him to the establishment of a herd of pure bred cattle usually does well to start with a small number. With his enthusiasm and his ultimate profit as incentives, his interest is sharpened, and from literature on the subject, and still better from the experience of others, he is able to constantly increase his knowledge of the breeding business. The herd and his experience will increase proportionately in this process and often save not only much capital but save many a good cattle breeder as to the business, by reducing the cost of his experience.

If a herd of cattle are to be profitable, they must be maintained in good condition and health. This requires healthy cattle in the beginning and a reasonable quantity of the proper kinds of feed, good water, fresh air, plenty of exercise, and some attention. Such accommodations for cattle result in good digestion, good circulation, good health, and ultimately good profits.

If there is one season of the year more than others during which a herd of healthy cows look good and give the impression of thrift, it is in the late spring or early summer. At this time they have been on pasture long enough to have gained some in flesh, and to have gotten rid of their old coats of hair; yet not long enough to have suffered from the dry pastures and hot weather of July and August. A herd of well bred beef cows on pasture at this time of year, although suckling calves, will be in a thrifty condition, even though not fat.

As a pasture blue grass has proven its worth and its permanency. There may be, and probably are, other pasture grasses which yield as good results, but it is sufficient to say that blue grass has been the substance of the pasture upon which most of the best herds of cattle in the Corn Belt have developed. It makes a most luxuriant growth during the early summer, but it is scarcely satisfactory during the hotter months, yet making much growth at that time. It is during this hot dry season of July and August* that so many herds of cattle become thin and lose the bloom which the early summer has given them. In ordinary years, if supplied with sufficient range of pasture during this season, cattle stand it without a great loss of flesh. A little grain fed to those which do not stand this season is, in most cases, money well spent, and the judgment of the good cattle man can be depended upon to find these cows needing such tretament. As the fall pasture appears, such feeding can usually be discontinued for the fall growth of grass, while not so rapid as in the spring, possesses more real feeding value and cattle do well upon it.

The winter pasture in the Southern part of the Corn Belt is blue grass in most cases and furnishes valuable feed, as well as inducing exercise. Some herds are allowed the range of field of corn stalks, but there is always more or less danger from such a practice. As supplements to winter pasture for the cow herd, the experience of our best breeders points with much favor to a combination of clover, alfalfa or cowpea hay with corn silage, or, in some cases, with corn stover in quantities which are determined by the condition of the cattle and the quality of the feed. If cows go into winter in good flesh it is possible that they can be carried through until spring without grain, but then again it is usually advisable to feed some grain to those in thin condition.

THE FINISHED PRODUCT, WHICH OFTEN ATTRACTS MEN TO THE BREEDING BUSINESS, DOES NOT SHOW THE TIME AND EFFORT THROUGH WHICH IT HAS BEEN ATTAINED.

The question of shelter is an important one. As a rule it is claimed that beef breeds which are out of doors much are less subject to tuberculosis, and other disease than closely housed breeds. Experience leads to the statement that plenty of shade in the summer and a good shed opening to the south during winter are satisfactory and all that is necessary for the main herd. At calving time, warmer places must be provided for a time.

It should be the object of any method of management of the breeding herd to keep them in thrifty condition. The important factor is to keep the condition uniform rather than to feed heavily for a time and then allow the condition gained to be lost during a subsequent season. This must have consideration if the greatest profits from a herd are to result. During the pasture months of spring, summer and fall, cows in grazing take ample exercise, but in the winter when cattle may be housed or yarded too closely, this point demands attention. Lack of exercise is one cause of lack of proper circulation of blood, which is, in turn, a frequent cause of indigestion and other digestive troubles. Much of our trouble in feeding can be traced to a lack of proper digestion. The range of a winter pasture is desirable not only for the food it supplies, but for the exercise which it induces. Calves to be used for breeding purposes should be liberally fed and developed at a comparatively early age. In many cases cattle stunted while young never recover from this lack of attention. The calves which are to be used for breeding purposes should be taught to eat grain before being weaned. This may be done by building a creep to which the calves have access but which the cows cannot enter. Calves can here be fed a mixture of oats, bran and corn and learn to eat. The quality of food for young cattle should be that which will develop bone and muscle, and the quantity should be liberal. The lack of proper nutrition of young animals is often the cause of inferior cattle when the buyer appears and unsatisfactory prices.

It is said that Amos Cruikshank bred his heifers to calve at 30 months of age and if heifers have been well grown this may be very properly done. Under ordinary conditions it seems advisable that cows calve during the spring months. Many calves are dropped during the fall and winter in our purebred herds, and the results are satisfactory. The time of year at which a cow calves is of not so much importance as the attention which she and her offspring receive.

Close observation should be constant on the part of the breeder, particularly to those cows which have just been bred or are expected to be bred soon. Cows usually come "in heat" regularly, but occasionally some animals will be found which are somewhat irregular. Cows will also be found which come "in heat" but do not show it to any great extent. Since upon the number of cows gotten in calf depends the greater part of a breeder's profit, it is of the greatest importance that every precaution be taken to see that all the cows are gotten in calf. It may also be said that those which prove themselves not to be breeders in the majority of cases are better off sold to the butcher than in a herd of breeding cattle. After breeding they need little attention, except that which is given the general herd.

As calving time approaches the cows should be watched. Dates should be kept of their date of service and observation by an experienced man will be sufficient warning as to when parturition may be expected. Cows calving while in pasture during summer and fall, can find no better place to give birth to their young than there, provided they are not molested by other cattle. Cows calving during the winter months should, by all means, have a comfortable and absolutely clean stall in a well lighted, well ventilated barn, in which to give birth to their young. It is the duty of every good herdsman to know about when cows are expected to calve, to be on hand, yet not to interfere with nature's process unless necessary. It is also his duty to give assistance to the cow in calving, if necessary, and to see that the youngster gets its mother's milk within a reasonable length of time after birth.

The question is often asked as to why the great number of cattlemen in America are of English or Scottish descent. It is also observed that in the majority of cases they are better cattlemen than many of our Americans. If they are better cattlemen it is perhaps not because they have had so much better knowledge in the beginning than other people, but it is because of their love for the animals and the interest which they have in them. It is a particularly noticeable fact that the best herdsmen of any nationality are those who know accurately each individual of the herd and know the condition of each at all times. If any one class of people are better cattlemen than others, it is because of the interest which they have manifested and the experience which this has naturally brought to them. It should also be said that just at the time of calving a breeder stands to lose or gain his year's proft and a calf lost means the loss of a year's work for one cow, hence the importance of extreme care and caution at this time cannot be overestimated.

If calves are born in the spring or summer they may well run with their dams until late in the fall, say until six or seven months of age. They should, however, be taught to eat grain before weaning in order that weaning will not cause a cessation of growth. Calves dropped in the winter should be given an opportunity to learn to eat grain and may follow their dams during the early part of the summer on pasture or may be kept in a small lot and allowed to suckle twice a day. This practice is followed by many of our good breeders. These calves receive grain as soon as they will eat it.

After weaning time it is sufficient to say that calves should have plenty of feed of good quality to eat, should receive enough exercise to keep them in good condition, plenty of fresh water, and otherwise humane and observant treatment.

There is little question but that success in the cattle business will follow the efforts of a man who will devote himself diligently to the study of the business and who will develop the power of careful and keen observation and use it constantly in the development and care of his herd. There is little question but that he will not only be able to produce good cattle, but that he will be able to produce them profitably and that the public are ever ready to appreciate valuable breeding animals whenever they appear. There is no business which of-

fers a more pleasant life than that of breeding good beef cattle. There is no other business which is on a more permanent foundation than is this one. With the number of pure bred beef cattle in the country ranging from one and two per cent of the total number of cattle and with many of these purebred cattle of a comparatively inferior quality, there is little grounds for the supposition that the pure bred cattle market will be overcrowded with good cattle in the near future. As a field for activity, general usefulness and a reasonable profit, there is no other which offers greater possibilities than does the production of pure bred cattle.

*It is at just this hot season (about the only one when blue grass fails), that owners of good "prairie" pasture (blue-stem in some sections, gramma and so forth, in others), have a chance to realize the particular value of this native pasture—Editor.

ENSILAGE FOR FATTENING.

Mr. Humphrey Jones of Washington Court House, Ohio, talking to a convention of cattle breeders on the value of "Silage for Cattle Feeding," said in part:

"Our practice has been to always feed all the ensilage and hay the cattle would eat and to add to the ensilage about one-third pound of cotton seed meal per hundred weight of animal per day, mixing the meal with the ensilage as it is fed. We have found that steers will eat of ensilage about five pounds per hundred weight per day, and that when there is added to the ensilage one-third pound per hundred weight per day of cotton seed meal that the gains made by the cattle are as great as any we have ever been able to obtain with a full feed of shock corn, or ear corn and clover hay."

Continuing, the speaker said that his silos were returning him an additiona. profit per acre of about $15 over the old method, by rendering available all the feeding value of the corn plant, much of which would otherwise be wasted. The speaker said he had found, however, that the sheds and yards required by cattle must be warmer and dryer when silage is fed, because it is somewhat like grass in that it is cooling to the body and also forms a wet manure.

In conclusion Mr. Jones said: "It must not be forgotten also that the corn plant of itself is an incomplete ration. The man who feeds it alone with nothing else will be disappointed. It must be balanced up with some nitrogenous food, the best of which in roughages are clover and alfalfa hay, and in concentrates cotton seed meal."

Silage and the Beef Question

How It Helps Reinforce the Failing Supply of Desirable Steers by Increasing the Carrying Capacity of Corn Belt Farms. Experiences in Which Its Use Gave More Feed and Better Finish.

Written for the American Breeder by Prof. F. G. King, Purdue Experiment Station, La Fayette, Ind.

A REVOLUTION is taking place in the production of better cattle. The number of cattle kept for the production of calves to be made into beef has been on the decrease for many years until seemingly the climax has been reached, and we now are face to face with a great shortage of cattle that must be made good in some way. As a result, the number of feeders who are raising their own feeding cattle are yearly becoming more numerous. The reason is obvious. They are being forced by necessity to either quit the cattle feeding business on account of inability to purchase, at a profitable figure, cattle to put into their feed lots, or to raise their own cattle. Practical farm management prevents the former alternative, hence each year sees a larger number of cows being kept for the production of baby beef.

Cattle are essential to proper farm management on the medium sized farms of the corn belt because they are preeminently the greatest roughage consumers of any domestic animals kept on the cultivated farms. Therefore, in order to secure the greatest benefit from the product of the farm stock must be kept to consume this roughage. In the production of corn, which must ever be the great crop of the corn belt, there must of necessity be produced at the same time large quantities of rough feed. In addition to the clover hay produced in the rotation to maintain the soil fertility, there is practically two-thirds as much dry matter in the stalks of corn as in the ear. The food nutrients of the stalk, however, are so unavailable to the animal on account of its fibrous nature that when fed as stover, only a small percentage of its real value is secured. Since the food nutrients of the corn stalk are so unavailable for animals, the roughage produced by the corn plant commands on the market a price altogether too small for the soil fertility removed by its sale. Therefore, on account of its chemical content and its abundance on the farm, a more thorough utilization of the roughage from the corn plant must be made and by far the most satisfactory animals for this consumption as will be pointed out later are cattle.

One of the great secrets of success in large factories is the proper utilization and elimination of all waste. This is now one of the great problems for the successful farmer. Corn silage offers the greatest source of improvement in the prevention of waste on the farm with which we are now familiar. When corn is harvested in the usual manner, not only are a large part of the food nutrients not available, but the woody portions of the plant are unpalatable, and even when eaten require so much energy in digestion that a large part of their real value is lost. However, when the plant is cut early and put into the silo, the entire mass passes through a process of fermentation which reduce the hard woody portions of the plant to a soft palatable food readily eaten by cattle, horses, or sheep. Silage properly made and fed to cattle is completely consumed with practically no waste. And not only is there a complete consumption of the silage, but the cattle in the winter are treated to a soft, succulent feed containing the laxative effect and thrift giving properties of good summer pasture. It is for the utilization of this roughage that cattle must be kept and when they are not to be secured at the market, they must be bred on the farms producing the corn.

One of the most striking examples of the value of corn silage for cattle is shown by the results of our cattle feeding when corn silage has been a part of the fattening ration. When properly supplemented with cottonseed meal, every acre of corn fed to fattening steers during the first three years of our trials returned a profit varying from $26 to $29 more than the same acre would have returned had the corn been fed in the ordinary way. The average of trials conducted the last two winters has shown that the addition of corn silage twice daily to a ration of shelled corn, cottonseed meal, and clover hay has increased the rate of gain one-fifth of a pound daily per head and reduced the cost of gains $1.21 per 100 pounds, and has produced enough better finish on the cattle to return a profit of $6.63 per head more than when no silage was fed. When this additional profit is computed on the basis of a carload of 20 steers, the returns from the silage would be $132.60 per car load. So favorable have been our experiences with silage that there can be no doubt that the time is past when the most profitable cattle feeding can be conducted during the winter without the extensive use of silage in the ration.

The economy of feeding silage is as marked when it is used for keeping breeding cattle as when fed to fattening steers. The breeding beef cattle at Purdue Farm have received no grain other than that contained in the silage since coming from grass. With a daily ration of clover hay, oat straw, and corn silage the cows are in such good condition that the question is often asked by visitors whether the breeding stock are not in too high flesh for best results in breeding. The cows, however, are regular breeders and produce strong, vigorous calves, and the cost of wintering is very small. Thirty to thirty-five pounds of silage and five pounds of clover hay will not only maintain a breeding cow and keep her in strong, thrifty condition, but will make her gain enough to permit her unborn young to reach its best development and will later furnish enough milk to grow the grain fed calf into excellent beef. The wintering period therefore requires approximately three tons of silage and one-half ton of clover. This amount of feed can easily be grown on one-half to two-thirds of an acre of land. With such a ration as the above used for keeping breeding stock, it is entirely reasonable to expect to produce enough feed on one-half acre to keep a cow for six months.

When it is considered that the area required to pasture a cow for six months in summer varies from one to three acres depending on the kind of land, the economy of the silo even for summer use can hardly be overestimated. By extending the feeding of silage later into the season and using it to supplement pasture, the areas required for keeping cattle the entire year may be reduced as much as one acre per head. While it is not feasible to restrict the pasture area too greatly on account of the health and vigor of the cattle that require exercise and some pasture for their best development, it should be borne in mind that many dairymen have been able to keep a cow for every acre of land in the farm and to produce practically all the feed consumed by the cattle.

One of the greatest detriments to our pastures is the fact that seasonal variation necessitates close pasturing at certain seasons of the year. With a silo for summer use, the pastures are supported and not only is the grass required by the cattle reduced but 4—BREEDER—Jan 29
periods of drouth are tided over without injury to the cattle or to the pastures. The use of silage in summer is coming more into use as the price of land advances, thereby increasing the capital invested in pastures. Already cattle feeders are fattening cattle in summer without pasture and many breeders are extending the use of silage into summer to supplement pasture because six months' feed for a cow can be grown in cultivated crops on approximately one-third the land that is required to pasture her for the same length of time.

In feeding silage it should always be borne in mind that it is lacking in protein which is essential to proper growth. Therefore, it must be fed with a leguminous hay when breeding stock are being kept. Otherwise, there will be a lack of growing material required for the proper development of the calf. The point is illutsrated by trials with full fed steers in which it was found that the silage replaced the clover hay to such an extent that corn and corn silage did not give satisfactory results. The addition of

ON SHELLED CORN, COTTONSEED MEAL, CORN SILAGE AND CLOVER HAY THESE STEERS MADE THE FASTEST GAIN OF 50 LOTS FED EXPERIMENTALLY AT PURDUE STATION.

corn silage to a ration of corn and clover hay gave no more economical results than when no silage was fed. However, when cottonseed meal was added to the ration to replace the protein removed by the reduction in amounts of clover hay eaten by the cattle, there was $6.63 per steer more profit than with any ration where silage was not fed. For any kind of stock, silage should not be fed alone, but in connection with a nitrogenous feed either as roughage or concentrate, and with fattening cattle receiving a full feed of corn, a nitrogenous concentrate is always essential.

Silage is destined to produce a revolution in the beef cattle industry of the corn belt, and to place on practically all the medium sized farms small droves of cattle to be fattened for market or to produce cattle for the market. The immense value of the roughage produced on the farm cannot continue to be wasted and cattle because of their great capacity to consume corn silage, must be the chief means for its disposal.

SOME NEW AMERICAN ROYAL PLANS.

From city and country alike have come many expressions of gratification at the arrangements finally agreed upon for making the American Royal Live Stock Show permanently a Kansas City institution. It has long been said by the business men of Kansas City, who give a good deal of money to the support of various enterprises advantageous to the town, that they give to the American Royal more cheerfully than to any other interest which receives their support. The American Royal, they say, brings a bigger percentage of good people and a smaller percentage of "undesirables" to the city than any other one of the score or more of events which attract people here in the course of the year.

The housing of the show being settled, the directors are already at work on next year's plans. They are considering an enlarged department for breeding hogs, and if the hog record associations do their part this will be the beginning of what the swine breeders of the Southwest have so long desired. Another feature which has been urgently demanded every year, but which could not be accomplished on account of lack of space is a display of farm machinery. There is a possibility now that with the larger grounds and new buildings, provision may be made for such a feature.

General Manager Rust of the Stock Yards Company is quoted as saying that the preliminary plans for the new buildings to house the live stock show indicate a cost in excess of the $100,000 which the Stock Yards Company promised, but apparently there is no hesitation on the part of the Stock Yards Company on this account. It was proposed at the outset to provide for the housing of a thousand show cattle, 300 show horses, 1,000 show hogs and 500 sheep, as well as for poultry and possible added departments. The buildings themselves will cover one-third of the added area of fifteen acres.

The horse show will not be moved up town to the Convention Hall, as was once thought possible. The pavilion which the Royal has used for the last two or three years will be kept standing, and will be given rent free by the Stock Yards Company, for the use of the show. This has proven a satisfactory place for the exhibition of light horses at the night show, and the building of the new viaduct which will connect Kansas City, Kas., directly with the new Union Station will make the show grounds so accessible to the night crowds as to do away with the old disagreeable features of poor transportation facilities. Patrons of the Royal may have to put up with the past accommodations for another year, but not longer than that, as the viaduct is an essential part of the Union Station plans and will come soon.

The Quarantine and the Tick

What the Fight Against Texas Fever Has Already Done for the Cattle Business of the South. Eradication of the Tick Will Save a $35,000,000 Annual Loss.

Written for the American Breeder by Dr. L. L. Lewis, Oklahoma A. & M. College,

MODERN veterinary medicine recognizes the fact that effective quarantine service is the first requisite in effectually controlling contagious and infectious diseases. It is not necessary to enumerate at this time the steps of progress that have been made in dealing with the various diseases of the lower animals nor to record the hard and faithful work of those who have been pioneers in this particular field. However, we do desire to consider briefly the progress that is being made and the benefits enjoyed by agricultural interests on account of the effective and finely adjusted system of quarantine regulations that are now in operation.

Quarantine is not being applied with equal effect in all cases of contagious diseases but if applied will be as effective in one disease as another. There are three major diseases to be considered and to which quarantine may be effectively applied in conjunction with such other sanitary means as are available. Tuberculosis, hog cholera and Texas fever are perhaps the three most important diseases that may be handled by modern sanitary methods, and of the three Texas fever is the only one that is receiving the attention that its importance demands.

The South has more to gain than any other section of the United States from effective and justly administered quarantine laws. No other section of the country is capable of higher agricultural development or possesses more agricultural possibilities. To develop any country to its highest degree along agricultural lines requires the raising of all classes of live stock and certainly no country is better suited to live stock industry and diversified agriculture than the Southern states.

It takes years to change an agricultural system, as those who have studied the agriculture of the South know. It has taken hard work on the part of many to uphold diversified farming and stock raising against the difficulties that have existed and that still exist to a certain degree. But there is a new agricultural era coming for the South and the successful handling of good stock on every farm will be one of the main factors in this change.

So far as stock raising in the South is concerned there are no severe conditions to cope with in the matter of climate and feed production, but there is, so far as cattle raising is concerned, a very serious obstacle to overcome in the way of Texas fever. No business can be made profitable to its greatest extent and be handicapped as the cattle business in the South is now handicapped. Yet in spite of this obstacle many have found cattle raising profitable.

It is sometimes difficult to convince the general public of the possibility of controlling or eradicating contagious or infectious diseases. We now know that the great Pasteur spoke the truth when he said that it was possible to eliminate any and all germ diseases. There has now been sufficient work done to demonstrate the truth of the above statement. A few years ago practically all were skeptical regarding the possibility of eradicating Texas fever from the South. Many of those who thought it possible regarded it as an impractical scheme. During the past six years sufficient work has been done to demonstrate the fact that the work is not only possible but that it is practical and profitable work. There are now and there always will be some who refuse to take an active part in progressive things, but the public as a whole are becoming educated along these lines and the successful issue of one line of work will make it easier to undertake others along similar lines.

It is estimated that the annual loss in the South from Texas fever is from 35 to 40 millions of dollars, a loss that can easily be prevented by the active co-operation of all concerned. During the past three years the quarantine line has been put south each season in practically all of the states through which the line passes. As soon as a county is proven to be free from infection the people get the benefit of an open market and unrestricted trade with other non-infected territory. We do not hear very much of outbreaks of Texas fever, the reason being the very strict enforcement of the quarantine law. Because we hear so little of the losses now should be no reason for lessening the precautions. We often hear those opposed to the enforcement of the Texas fever quarantine assert that it will be impossible to keep the South free from the ticks even if they are eradicated. We are told that infected cattle would cross the southern border in hundreds of places. The quarantine line is effectively enforced in Oklahoma and I believe that the same is true in all of the states where it is necessary to maintain a quarantine against the fever tick. If the line can be protected in one place it can be protected at any other place and where a natural boundary such as a river exists the work would be comparatively easy.

The effectual enforcement of quarantine regulations is what is now protecting the live stock industry of the United States against some of the plagues of the old world. Pleuro pneumonia, rinderpest, foot and mouth disease and other dangerous diseases of live stock would soon be to contend with in this country if quarantine was not efectually enforced.

One can hardly imagine the possibilities of the South as a cattle country, once the Texas fever tick is eliminated. The northern breeder does not now have such a market for pure bred cattle as will then be open to him. Dairying will become one of the important features of southern agriculture and other lines of business that are dependent upon successful stock raising will develop. There may be many obstacles placed in the way of tick eradication, but eventually, by hard work, enforcement of quarantine regulations and the improvement of the grade of cattle by the introduction of pure bred stock we will see the cattle business of the South developing along profitable lines. Not only will the cattle business benefit from the elimination of the fever tick but almost all other lines of stock raising will profit. When any class of stock begins to be improved in quality the added profits soon convince the farmer that a similar improvement of other classes of farm stock will be just as profitable.

The enforcement of any quarantine regulation is not an easy matter. It requires the active co-operation of every one to make a success of it. The greatest elemnet in the enforceing of any quarantine law is the eduation of the public along these lines. A knowledge of how disease is communicated, a knowledge of how epidemics are spread and how they may be controlled must be had by those who are to be first affected by the enforcement of the law. Tuberculosis of man could soon be eliminated if there was sufficient public sentiment to enforce what every one who has studied the disease knows to be reasonable restrictions, and the same applies not only to this disease but to practically all diseases of man and the lower animals. Too often quarantine regulations have our enthusiastic support only when the law is being enforced in some other locality or on some other farm. Enforcement of quarantine is not to punish the man who may happen to have the diseased stock, for he has already met sufficient misfortune, but it is to protect his neighbors against similar loss.

BREEDING TWIN CATTLE.

An Iowa breeder who is raising baby beef asks if it would be possible to create a strain of cattle that would produce twins with any regularity.

Success has been made in multiple pregnancy in ewes, but no attempts have been made to especially separate a strain of cattle which would produce twins or triplets. There are, however, found in certain families several generations of twins, and we are of the opinion that if both sides of a union could trace several generations in multiple pregnancy, that this characteristic could be established with much regularity. The production of more than one offspring, however, is controlled entirely by the female. When more than one fetus is delivered it is usually the result of more than one egg being fertilized. If the female only released one egg, unless it should separate after fertilization, there could not be more than one calf at that delivery.

There are cases, however, where conception takes place at different heat periods. This has been proven in horse breeding by the fact that mares occasionally produce twins, one being a horse and the other a mule. In the cow we find twins occasionally resembling two different sires of different types and characteristics.

If a strain of pure bred cattle had been developed that would produce twins within themselves, it would take several generations for a bull to be of any service as a twin producer in another herd. All the bull could do would be to transmit this characteristic to his female offspring, and they in turn might be capable of releasing two or more eggs, at a given heat period, which would result in multiple pregnancy.

There is among all breeds of live stock a hereditary tendency either to liberal production or shy breeding qualities. This is not confined to either sex. A sire may transmit a certain quality to one sex that the other sex may not have as extensively. This is better shown among the standard breeds of horses, the only breed of live stock where a test has actually been made. For generations sires frequently produce great brood mares, while their stallions may not be speed getters, or the next stallion may be the opposite. The producers of pure bred live stock should look further than to see whether the sire and dam are properly registered or not before buying valuable animals to add to their herds. Prolific breeders often belong to a prolific strain.

While it might not be profitable to produce a breed of cattle that would produce two or more calves at a time, it might be profitable to have such a strain of prolific breeders in breeds of our domestic animals for the purpose of encouraging more regular delivery of animal life. We should like to see an experiment of breeding twin cattle, and if some breeder of pure bred cattle wishes to carry on the experiment, we will be glad to hear from our readers who have both male and female in some given breed that have been twinned for several generations, and will be of as much assistance as possible in helping to create this prolific strain.

Concerning "Blue-Gray" Cattle

A Cross of "Blacks" With Shorthorns That Has Long Been a Fat Stock Show Favorite in England. The Plan Tried at Ames, Iowa. Advantages and Disadvantages.

Written for the American Breeder by Prof. E. N. Wentworth, Iowa State College, Ames, Iowa.

THE blue-gray color in beef cattle is produced by the mating of white or light roan Shorthorns with Galloway or Aberdeen-Angus blacks. The coat, of course, is the conspicuous part of the animal and through it this type has become known to the butcher and consumer. For over one hundred years the cross has been found in Great Britain's markets, and since the early sixties their numbers have been large enough to appreciably influence buyer's values. Their rise in popularity nearly threatened with extinction the foundation stock from which the Aberdeen-Angus arose and only the heroic efforts of one or two breeders maintained the purity which produced the leading finished steer breed of today.

A brief consideration of the stocks mentioned in the first sentence should throw some light on the expected results. In earlier times, the eastern coast of Scotland possessed two distinct varieties of cattle; one, small, scrawny and polled—the Crofter's cattle—and the other larger, horned, thriftier and red or dun to brown—the cattle of the better classes. From a cross of these, the Aberdeen-Angus arose, the smaller type impressing its color and polled character on its more fortunate rivals.

The southwestern part of Scotland possessed also a type of dun to black polled cattle. These were reared on broken country where the ocean winds and fogs swept unrestrained across the pastures, and produced the heavy, double-coat and hardy, slower maturing Galloway. As far as finish and carcass beef is concerned the Angus has easily the advantage, but as an off-set one may note the more uniform color, polled character and greater hardiness of the Galloway. In fact, Wm. McCombie, the second of the great Angus breeders, states that where his Angus could not live, his Galloways would produce him a profit. He also states that up to the three-fourths fat stage they equalled the Angus, but were difficult to finish. The Shorthorn is so well known, little comment is necessary, its long history, color characters, fattening propensities, and adaptable nature being a matter of common acquaintance.

The Galloway cross is usually made with a white Shorthorn bull, the Angus cross either way. The first method has the advantage that it calls for shelter and extra care for the bull alone, while the hardy mother can meet the conditions to which she is accustomed. It may be noted here that this idea was partly in the minds of the staff of the Iowa Experiment station when the blue-gray investigation was begun. There is a distinction between the blue-grays produced by the two methods. The Angus cross-breds have a greater tendency to horns, to off-colors, such as reds or roans, but are earlier maturing; while the Galloway crosses show greater uniformity in type, color and horn, but fail to finish quite as early. However both gain marked advantage in the first generation over pure breds of either breed. In replies received from nine leading British breeders as to the value of blue-gray cross breeding, the following points were dwelt upon unanimously:

1. The polled character.
2. Uniform and desirable colors.
3. Greater weight for age.
4. Easy keepers.
5. Superior quality of flesh.
6. Early maturity.

One well known stockman, John Ross, further states that they bring from two to four pence per pound higher than other finished cattle. As feeders their value lies well above the other beef, $6.50 to $8.00, being representative prices ten years ago.

Definite figures on horn and color inheritance are interesting. English breeders note that about 90 per cent come polled, 8 per cent with scurs and 2 per cent horned. The blue-gray color comes with Galloway crosses in 90 per cent of the cases and the remainder are blue gray with light spots. Angus do not give such uniform results. James Biggar, of Dolbeattie, Scotland, notes the following from a herd of Shorthorn cows. Two year olds sired by a Galloway bull were all polled and blue-gray while yearlings from the same cows and an Angus bull were varied in color and horned in several cases.

While of interest the above points do not demonstrate the practical value as gainers. Four year averages from winners at the Smithfield fat stock show gives the following data:

	——Under Two Years.——			———Over Two Years.———		
	No.	Aver. Age.	Daily Gain	No.	Aver. Age.	Daily Gain.
Hereford	21	673.1 days	2.16 lbs.	21	1012.8 days	1.877 lbs.
Shorthorn	22	677.3 days	2.157 lbs.	21	1014.5 days	1.873 lbs.
Angus.	22	675 days	2.202 lbs.	18	1014.0 days	1.85 lbs.
Blue Gray	23	674 days	2.212 lbs.	22	1024.2 days	1.925 lbs.

It will be noted that the blue-grays lead in gains at both ages and that they have over 10 days greater age as a handicap in the older class. This works as a deterrent, for it is well known that greater age or more advanced feeding decreases daily gains.

From 1892 to 1903 the blue-grays made constant increase in per cent of winnings at the Smithfield Fat Stock Show. The following table shows the growth:

1892—Grand champion, reserve grand champion, best steer and heifer.

FIRST CROP OF BLUE GRAYS AT AMES FROM GALLOWAY COWS AND SHORTHORN BULLS.

1893—First place in 3 out of 4 rings, in cross-breds.

1894—No foremost honors.

1895—1st in all cross-bred classes, best female and reserve grand champion.

1896—1st, 2nd and 3rd in all cross-bred classes, champion female, grand and reserve champion.

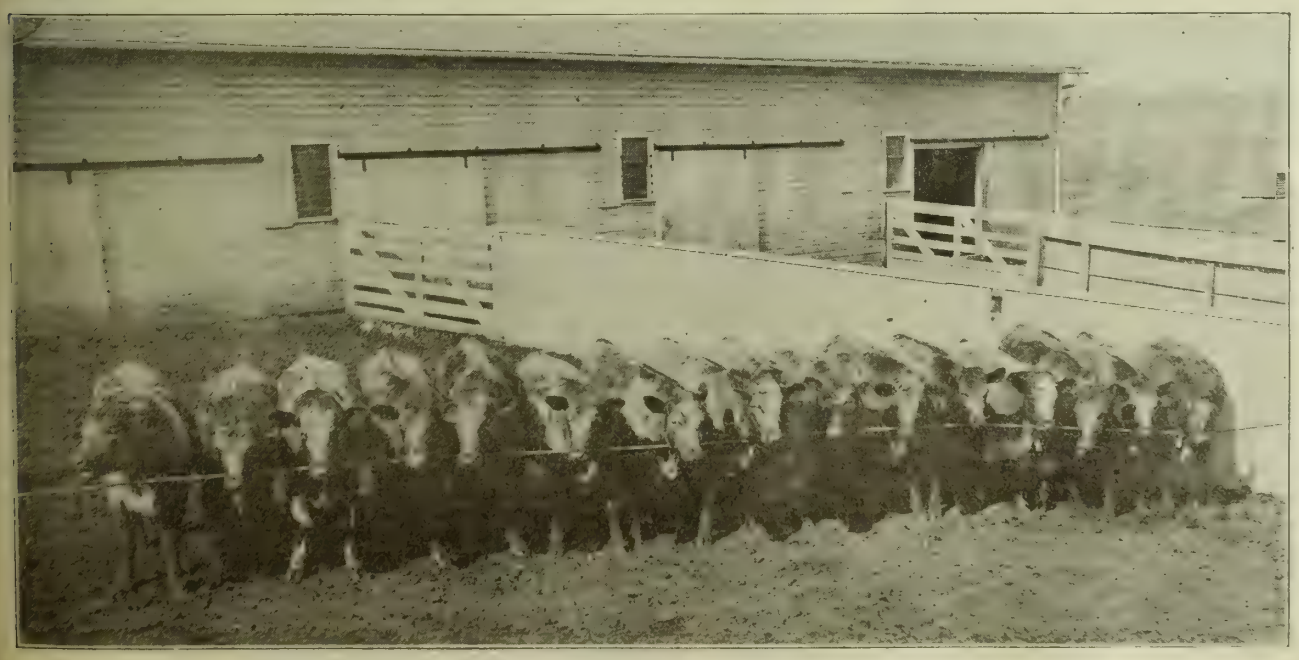
1897—Champion heifer and grand champion of show.

1898—All first for cross-breds and grand champion. They furnished strongest class in show.

1899—Champion heifer and reserve grand champion.

1900—Best heifer, best animal under 2 years, reserve grand champion.

1901—All cross-bred firsts, reserve and grand champion.



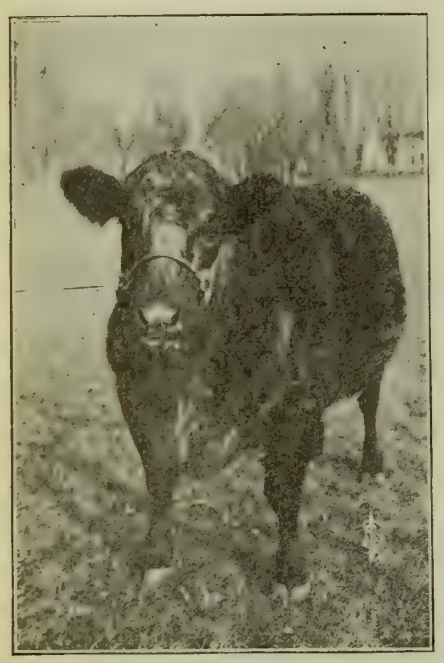
1902—Champion cross-bred and grand champion.

1903—Best animal under 2 years, best heifer, grand champion.

Seven grand champions and six reserves are a just index of what the cross can accomplish relatively under ordinary conditions.

With such marvelous success for blue-grays abroad, the Iowa Experiment Station determined in 1902 to attack the problem in this country. Forty-seven Galloway cows, 24 pure bred, were mated to the white Shorthorn bull, Dr. White, and to the roan Shorthorn bull, Scotland's Crown. The cows were all black and polled, one only having scurs. All had the long black coats and furry undercoats typical of their breed, but were only an average herd in beef character, the rough shoulder, flat fore rib and high tail head being present in almost unreasonable proportions, even for Galloways. The two bulls sired the first crop of calves, after that only Dr. White was used. Twenty-four calves came in this lot, two that died and eight others, sired by Dr. White, then a yearling. The average birth weight was 68.75 pounds, only medium. Twenty were blue and gray and twenty polled. Four were red-roan, one of them by the white bull, and three had scurs and one had horns. Fifteen of these, sold as a 2-year-old car load, topped the market on a dull day at $7.25. Their average weight was 1,181 pounds and an average gain 1.62 pounds. Steers of the lot averaged 1.69 pounds daily and heifers 1.53 pounds. The heifers were all spayed and showed higher finish externally than the steers, but were too "wastey" for American trade. To the exporter the steers sold for $10.57 and the heifers for $10.10. The heifers dressed 63.79 per cent and the steers 63.87 per cent. They were grown under farm conditions the first year and the second year were fed out.

The second crop of calves was better than the first. They were all by Dr. White, were evener fleshed and thicker, and weighed 76 pounds at birth. They are the lot shown in the



THE SECOND CROP, ALL SIRED BY ONE WHI TE BULL, WAS MORE UNIFORM.

illustration. All were blue-gray and polled.

The third lot were better still, averaging 82 pounds at birth and were all polled and all but one blue-gray.

From these various lots came steers that were well known in the show-ring although the numbers in the breeding herd were small. Tama Jim was first and Miss Skinner second as junior calves and junior yearlings at Chicago, two successive years. Other calves did almost as well, so that their merits as show animals was firmly established in comparison with other breeds.

In conclusion it may be stated that as market animals and as show animals the blue-grays have demonstrated their equality or even superior-

MISS SKINNER, A PRIZE WINNER FROM THE SECOND CROP.

ity, while the opportunity for the use of hardy dams offers hope to countries whose environment has hitherto been considered too rigorous for beef production. While the increased excellence is not noticeable enough to permit of a breeder's abandoning his practices for blue-gray methods, yet it offers one means of economy in a constantly intensifying agriculture.

Author's Note:—The writer is indebted to Prof. J. A. McLean of Massachusetts Agricultural College, while a senior at Iowa State College, for work here given.

BULLS TO REWARD TEXAS FEVER FIGHTERS.

Pure bred bulls as prizes are among the inducements being offered to the public spirited people in 51 Mississippi counties, for co-operation in ridding that section of Texas fever. The campaign which the United States Department of Agriculture is conducting against the Texas fever tick has reached the point where the inspectors in charge see their way to a complete cleaning up of considerable sections, provided they can get the support of a majority of the citizens interested. To encourage this support the department at Washington has sent out letters to the agricultural colleges in the principal stock breeding states which enjoy freedom from Texas fever, and has asked the colleges to secure the co-operation of the various breeders' organizations within the state looking to the donation of pure bred bulls to be given as prizes. The railroads interested are also helping, and the intention is that every person and community that helps in this way will be given the first benefits from the stimulated demand for breeding stock which is bound to come when once the ticks are done away with.

Seven hundred and fifty million dollars is the best estimate for poultry products this year.—From the 1911 report of the United States Secretary of Agriculture.

Wintering Cattle on the Range

Practically All Growers Provide Extra Feed, But Even This Will Not Always Prevent Loss. Water Question Equally Serious. How the Wind Helps.

Written for the American Breeder by Prof. G. E. Morton, Colorado Agricultural College.

IN the early days of the range cattle industry a large percentage of winter loss was counted as a certainty and figured off in advance. At present the owners of range cattle who fail to provide some hay for winter feeding are comparatively few in number. If one has sheltered range where the grass is good, only enough hay is provided to tide over during severe storms. But if the range is normally covered with snow during the winter, hay for the entire winter season must be provided. Even when feed is good a long continued snowstorm with heavy wind will kill many cattle, for cattle will not hold their place in a storm. Then turn tail to it and drift with the wind in their effort to avoid the cold, and occasionally find their way into steep gullies where they are hemmed by the snow and succumb to cold and hunger before they are discovered.

Occasionally a late spring snow storm catches even those who have wintered their cattle carefully. Grass comes on early in the spring and open weather holds for so long that the owner, with his hay nearly gone, is tempted to turn his cattle out of the meadows upon the range. The new grass is washy and does not give the cattle strength, and a severe snow storm covers all feed, resulting in heavy losses.

Normally, however, winter losses upon the range are now comparatively small. Men ranging cattle have a home ranch which serves as a center for their operations, and they either have hay land of their own or buy hay of their neighbors.

Cattle are now worth too much to allow them to die if they can be saved. In Colorado, range cows are valued in the 1910 census at twenty-seven dollars per head, so that the loss of a hundred head would be felt by any owner.

The present winter has been universally severe in the range country, as elsewhere. Snow storms have been frequent and heavy, and the snow has lain upon the ground instead of blowing off and leaving the grass exposed. Many Eastern people imagine that a hard wind following a snow storm would only make conditions worse, but the wind sweeps the range bare unless the snow has packed hard or frozen. One of my vivid memories is a snowstorm on the Shoshone reservation in Wyoming. We were doing farmers' institute work in the month of March and found it necessary to cross from Lander to Thermopolis, a distance of about sixty miles. When we left Lander in the morning, the sky was clear and we were enjoying the brightest kind of Western winter weather. After we had gone twenty miles it began to snow and soon thickened so that we could barely see the horses' feet. The driver became confused and wanted to turn back, believing that we were going in the wrong direction. After ten miles of it we struck a Mexican's shack—the only one in forty miles. The next morning it was necessary, in going up the mountain, to go ahead of our horses and break road so that they could get their knees above the snow. The snow was above our knees everywhere; and cattle that were caught out on the range could get absolutely no feed unless a wind came up to clear the snow away. Horses will paw down to grass and nibble enough to keep them alive, but when snow covers the grass, cattle must be fed or they will die.

This winter a man coming from Kansas City to Denver, counted fifteen dead carcasses along one mile of track. Another claimed to have counted one hundred and fifty carcasses within ten miles. This means serious conditions. And it means that no one is able to help the cattle; for in Colorado if an owner of starving stock refuses to feed them, the Humane Society has authority by law to take charge of the cattle. The situation throughout the West is much as it is in the East. Unusually dry weather caused a shortage of all crops, and feed is scarce. There is little hay and it is high in price; and worst of all the range grass is so short that even where the snow has disappeared there is not sufficient sustenance for cattle, so that feed must be provided.

The first thing attempted by an owner when he sees that his cattle cannot get grass, is to move them to meadows where they can be fed hay. This means getting them to some valley, and gives an added advantage in furnishing water. Cattle cannot subsist long upon snow as their source of supply of moisture, and when the small streams freeze solid they must he moved to larger streams or to valleys with an abundant supply of well water. When cattle are extremely thirsty and weak from hunger, they must be handled carefully in bringing them to streams frozen part way in from the banks, as they are likely to crowd a large number into the stream, and if they do not drown they may succumb to the extreme cold because of their wetting.

When a bunch of cattle are so far from hay that it cannot be gotten to them by railroad or wagon or both, they can often be carried through by the use of more concentrated feeds which can be more easily hauled because of their lesser bulk. Corn or cottonseed cake are commonly used, and the cake is rapidly coming into favor because it gives much better results where a little grass or wild hay is available. The cake because of its high portein content makes a much better ration with range grass or wild hay than does corn.

Unless there is a likelihood that the storms will be long continued, necessitating feeding the rest of the winter, it is often advisable to separate out the weaker animals for feeding, leaving the stronger ones to rustle for themselves. It is rare that an animal once fed during a part of the winter shows a willingness to get out and rustle with the old energy when once more thrown upon his own resources. So if the feed supply is short it may be kept for the weak ones.

Sometimes the supply of hay or grain in an entire range section is short, and if the cattle are to be saved they must be gotten to the railroad and shipped to another part of the state or even to another state. This sounds simple, but when it is considered that during storms railroads have troubles of their own, it is not so simple as it might be.

And if the cattle are in a section of the country quarantined for mange, they cannot be moved to clean territory without danger of infecting that territory. And under interstate regulations, they cannot be moved to any portion of another state, infected or uninfected, without first being dipped, which, of course, would result in a heavy death loss during extremely cold weather. The Bureau of Animal Industry met the emergency this winter in a prompt and fair spirit when called upon to do so by the Colorado Live Stock Inspection Board, and the Colorado Humane Society, waiving their rules to the extent that they would allow shipment of Colorado cattle from infected districts to other infected districts in Kansas, where there was a surplus of feed, provided the state boards would stand guarantors that the cattle would be dipped as soon as suitable weather occurred.

All of these measures accompanied by better weather conditions—in some sections east of the mountains a chinook wind melted the snow away in a night—has resulted in the relieving of stock to such an extent that the winter losses will not be nearly as large as was at one time feared. The winter has given its lesson, however, and has impressed once more upon the cattlemen the undoubted fact that safety lies chiefly in having hay, and plenty of it.

BARRENNESS IN CATTLE.

(Continued from page 4.)

Accidental abortion is of frequent occurrence among cows. Any serious injury to the abdominal region or other parts of the body, through violence from falls, being hooked by mates, chased about, or great fear, may provoke abortion. Any feed containing substances that have a tendency to constrict the uterus, such as ergot, is very dangerous. Feed of any kind that caused derangement of the digestive tract resulting in indigestion, overloading, diarrhoea, etc., may lead to an expulsion of the fetus. Moldy and very dusty feed should be included in the list.

If a cow has once lost her calf the tendency is for her to repeat the act, and she may eventually become a habitual aborter. Abortion may take place a few weeks after pregnancy or at any later period. When it occurs early in pregnancy, the fact may not be easily detected, but owners should carefully watch for any bloody or otherwise abnormal discharge adhering to the tail. When cattle are followed by hogs the fetus is usually devoured, thus eliminating a clue to a possible case.

Occasionally a cow will not conceive when mated with a certain bull, yet both animals may be fertile when mated with other animals. This seems to be influenced by peculiar sex characteristics and a shy breeding effeminate appearing cow should be mated with a bull of strong masculine tendencies.

POSSIBLY A HELP REMEDY.

During a recent visit to Ireland, we ran across an idea worthy of trial in this country. The population of that little island is quite dense and had it not been for the fresh air from the sea, the great white plague might have diminished the population. Until a few years ago the poor people of that island were very poor. Many families were covered with one small roof, but of recent years a helpful change has taken place in that country. A commission has been formed by the British government which purchased land and erected a great many small cottages on one acre tracts. The houses are usually of two good, medium-sized rooms, but substantially built. The acre of land is always very fertile and tillable. A good well of water is procured, and the land is fenced substantially. These houses are rented to the poorer classes of people, who must pay the commission a rent of two shillings (48c) every week. The houses are located in the vicinity of farmers who employ agricultural help. On this acre the family grow their vegetables, and it would surprise many American gardeners to know how much stuff can be produced on this small tract of land. Just as soon as one crop is harvested another crop is growing. Often the second crop is planted before the first crop is garnered.

Frequently we have thought that such an arrangement might be put into operation in this country, but at the present at least, it must be done with private capital. Many large breeders and farmers, who depend largely upon hired help, might erect buildings of this kind to a very good advantage.

HALF FEEDING CATTLE.

The term half feeding usually applies to steers old enough to be prepared for the feed lot. There are many different methods of half feeding or roughing cattle, but within the last few years an extensive plan has been carried on in the flint hill country in Kansas. This is a range of rough, limestone land, usually very rocky, about fifty miles wide and 100 miles long, the center of which is about 120 miles to the south and west of Kansas City.

There are hundreds of beef producers who buy their cattle in the Southwest and especially in the Panhandle country. These are usually about three years old or some of them long twos, if they are well developed. These cattle are usually purchased in the South, and are brought to the flint hills country, where their principal feed for the winter is shock corn, about ten to fifteen bushels of corn per head, and the fodder with it. The object is to keep these cattle growing and gradually increase the weight. They are turned on pastures as soon as the blue stem grass in that section is sufficiently developed. This pasture is of short duration compared with the blue grass regions. About five months is its average length of usefulness.

THE STEERS THAT MADE 392 POUNDS PASTURE GAIN.

But it is marvelous to know how much beef can be accumulated on these animals during that short period. A bunch of steers that do not increase 300 pounds per head is considered very low. Frequently a 400-pound increase will be made.

Green Sallyards of Eureka, Kas., once turned a bunch of 1,1000-pound high grade, Shorthorn steers on pasture in the spring and sold them in Kansas City, averaging 1,492 pounds in July. This is a wonderful record, considering the fact that this pasture is not considered good until the last of April. Cattle handled in this manner are in position to go to the market early and are not compelled to compete with either the summer fed or the regular feed lot cattle. A great deal of this pasture is very rough and rocky, and if a stranger should visit one of these large rocky pastures during the winter, he would wonder how the grass had an opportunity to grow among so many rocks. But this land is valuable. Land that could have been purchased not many years ago for $1.25 per acre is now bringing from $20 to $30 per acre for grazing purposes only.

The Southern farm boy is showing the way to grow more of all crops on an acre.—From the 1911 report of the United States Secretary of Agriculture.

New Treatment for Stock Ills

Veterinarians in Convention Give the Latest in Hog Cholera Serum Treatment, Two New Tests for Tuberculosis and "Cornstalk Disease."

Reported for the American Breeder by Dr. Chas. D. Folse, Kansas City Veterinary College.

Demonstrations of the opthalmic (eye test) and the intradermal tests for tuberculosis, diagnosis of hog cholera, the use of anti hog cholera serum, and discussion of the so-called corn stalk disease, constituted the features of the meeting of the Missouri Valley Veterinary Association in this city, January 30 to February 2, inclusive. The meeting was the largest the association has ever held, there being some two hundred and fifty practicing veterinarians from Arkansas, Texas, Oklahoma, Missouri, Kansas, Nebraska, Iowa, Illinois, Minnesota, Michigan and Ohio in attendance. Interest centered in the tuberculin demonstrations and it is probable the results obtained will mean that the intradermal method of testing will within a short time become the official method over the whole country because of its simplicity and inexpensiveness.

As all stock owners know, the temperature method of tuberculin testing now in use entails the expenditure of about two days' time, which occasions considerable burden to the stock owner who is compelled to submit to it to ship stock interstate. Temperatures must be taken at three hour periods for nine hours before injection of the tuberculin. Beginning at the ninth hour after injection, temperatures must be taken at two hour periods until the twentieth hour. A diference of two degrees between the maximum temperature before injection and the maximum temperature after injection constitutes a reaction or positive evidence of tuberculosis. From this it is readily seen the temperature test is burdensome and expensive.

The Eye Test With Tuberculin.

The opthalmic tests consists in introducing a small quantity of tuberculin into the eye of the animal to be tested. This is accomplished by making a dilution or a salve of it. Within eighteen hours afterward, if the animal be tubercular, there appears a marked inflammation of the membrane of the eye and a characteristic discharge. If the animal be not tubercular there will be no disturbance whatever.

The intradermal test consists in injecting into the loose folds of skin on one side of the tail of a small quantity of tuberculin. The injection is made at the point named because that location offers opportunity for comparison with the opposite side. The injection must be made into the skin and not under it. If the animal be tubercular, within forty-eight hours after injection, there will appear at the point of injection a well marked swelling of a non-inflammatory nature and the animal will display a characteristic switching of the tail. If the animal be not tubercular there will be no disturbance at all.

Fifty-eight head of cows were given the ophthalmic test Wednesday, January 31. Of that number thirty-three had previously been given the subcutaneous test. Six reacted to the ophthalmic test but only two had reacted to the subcutaneous test. Post-mortem examination showed lesions of tuberculosis in five of the reacters. Of the ones which did not react, none showed any lesions. These results tend to indicate that some cases of tuberculosis may be detected by the ophthalmic method which may not be detected by the subcutaneous method, while, on the other hand, there is possibility of error in the results.

Forty-two head of cows were given the intradermal test Tuesday, January 30, one of which reacted. Thirteen head of these cattle had previously been given the subcutaneous test and the same animal had reacted. Post-mortem examinations disclosed ample evidence of tuberculosis. Of the animals which did not react none showed any lesions. These results tend to indicate the intradermal test is comparatively accurate.

At a meeting of the Association of State Live Stock Sanitary Boards in Chicago in December a similar demonstration of the two tests was held with comparatively similar results. Sixty-one head were subjected to the intradermal test with 90.16 per cent of correctness. Sixty-six head were given the ophthalmic test with 81.81 per cent correctness. The tests at Chicago were not carefully guarded as to technique and post-mortem examination, hence it is probable there might have been considerable error in the results.

The work at Kansas City was conducted by Dr. K. J. Washburn, assistant pathologist of the Bureau of Animal Industry, assisted by Dr. S. Sheldon, state veterinarian of Missouri, Dr. L. D. Brown, deputy state veterinarian of Missouri, and the local inspectors, and every precaution was taken to insure accuracy of the results. The federal government has been experimenting upon the two tests for some time past and Dr. J. R. Mohler, pathologist of the Bureau of Animal Industry, stated recently that if money could be had extensive tests of the two methods would be made with the view of establishing one of them as the official government test. The state officials of Missouri have employed the intradermal test to about fifteen thousand cases recently with 98 per cent of correctness and Dr. S. Sheldon, state veterinarian of Missouri, has stated that he believed that the state of Missouri would make the test official within a short time.

Plain Talk About Serum Treatment.

Following a technical paper on hog cholera and the serum treatment by Dr. F. W. Hueben, superintendent of the serum plant of the American Serum Co., there was a lively discussion of the problem attending the distribution of anti hog cholera serum. Dr. A. T. Kinsley, pathologist of the Kansas City Veterinary College, at the clinic at the college on Thursday, killed four hogs affected with cholera to demonstrate the characteristic lesions of cholera. A hog affected with swine plague was also killed to illustrate the similarity of the lesions. Dr. Kinsley also called attention to the fact that worm affections of the bronchial tubes might be mistaken for cholera. It was pointed out that much of the ill results from the use of serum is due to its administration in herds which have another disease than cholera, in which case no desirable results can be expected. Dr. M. Reynolds, dean of the veterinary department of the University of Minnesota, discussed the misuse of serum, citing statistics to substantiate his statements. Dr. Reynolds suggested the serum was often administered in too small dosage and that often the operator was in too great a hurry to insure proper results. Dr. A. T. Peters, veterinarian of the experimental station of Illinois, objected to any method of serum administration other than the simultaneous, that is, the giving of virulent blood with the serum. Dr. J. I. Gibson, state veterinarian of Nebraska, at once took issue with Dr. Peters, claiming the shipping of cholera blood was too dangerous. The discussion developed the sentiment on the part of the association was that all shipments of cholera blood should be controlled by state authorities, both as to the locality into which it is shipped and as to the manner of its handling to insure that cholera is not transmitted to non-infected areas in that manner. The association also adopted a resolution asking inspection of serum producing plants that irresponsible parties may be prevented from placing the product on the market.

Pointers on "Cornstalk Disease."

There was a lively discussion of the so-called corn stalk disease on Tuesday and several valuable points were brought out. Dr. T. P. Haslam, pathologist of the State Agricultural College of Kansas, presented the chief paper. The chief thought as presented by Dr. Haslam and Dr. Kinsley was to the effect that the mould on feed stuffs is responsible in a measure for the disease, but that the mould is not disease producing until certain chemic substances are present in the food itself. It was suggested soil or climatic conditions may be responsible for the presence of this chemical substance in the food at certain times. Dr. Haslam reviewed numerous experiments to establish the validity of his statements. No definite and satisfactory method of treatment was offered further than drastic bowel stimulants in the early stages and change of feed immediately the disease appears. It was suggested corn could often be made safe by shelling and removing the mould by fanning.

WHY NOT GET SOUTH AMERICAN TRADE.

A wonderful opportunity awaits the pure-bred beef cattle industry of this country. During the last year the foot and mouth disease has invaded the British Isles causing a quarantine to be placed against that section by the Argentine and other governments. The writer happened to be at the Royal Agricultural Show in England last year when the big beef cattle sales were stopped on account of this malady. The quarantine was first confined to a very small district, but later outbreaks showed that it was epizootic and is still dangerous.

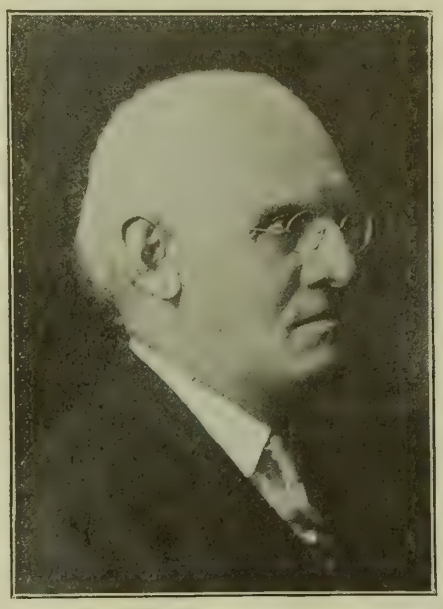
Argentine buyers have been very liberal buyers of the best live stock, especially beef cattle, which England produces. There are at present a great many breeders in that country who are in the market for good individuals. It has frequently been said that these Argentine buyers do not stop on price.

We contend that just as good beef cattle can be found in the United States as in England. Why not encourage an outlet for pure-bred stock and especially the beef cattle? We would like to see the representatives of beef cattle breeders Associations join together for the purpose of encouraging the sale of cattle to the Argentine breeders. Some effort has been made in this direction, but if it was taken up by the Record associations, that have money in the treasury and are backed by the breeders of this country, a great market should be the result. We will be pleased to hear from breeders on this subject.

Our Diminishing Beef Supply

Beef Cattle Have Decreased 6.8 Per Cent, While Population Has Increased 21 Per Cent. Farms of Corn Belt Must be Depended on More Than Ever Before to Make Up Shortage.

Written for the American Breeder by B. O. Cowan, Assistant Secretary American Shorthorn Cattle Breeders Association.



ANY question that relates to the food supply of mankind is of vital importance. This is true at any time and under normal conditions, but at a time when nearly all food products are abnormally high the discussion of this question will attract greater attention. There is no means of determining the exact ratio of beef to other food products in the dietary of mankind, but it is safe to say that it constitutes an important part. However, much other meats may enter into this food supply, beef is a leading element. It cannot well be eliminated; there seems to be no satisfactory substitute. Hence the future beef supply is a live question.

For several years well informed stockmen have called attention to the shortage in beef cattle in the United States and have predicted that this shortage was becoming greater with the passing years. These predictions fell on listless or unbelieving ears, even among beef producers. But the claim has been sustantiated during recent years by reports from the Department of Agriculture at Washington. This decrease was estimated at 1,000,000 to 1,500,000 head annually. Now comes the last census report showing that duirng the last ten years beef cattle have decreased 6.8 per cent, while there has been an increase of 21 per cent in our population. And what makes this shortage in the amount of beef really greater than the amount indicated is the fact that beef animals are now marketed at an earlier age than during former years, so that they do not represent the same amount of beef. At first thought a decrease of 6.8 per cent in beef cattle in ten years should cause no anxiety about future meat supply, but when it is known that this decrease is coincident with an increase of 21 per cent of beef eaters it presents a condition that merits the serious consideration of the beef producers.

The wonderful expansion of the range cattle industry 20 to 25 years ago with free range and unlimited grass, caused most Corn Belt farmers to sell their cows and cease raising steers. The subsequent encroachment of the homeseeker, clamoring for land, has gradually circumscribed the ranch industry and in many instances has caused the sale of the large bands of cattle. The liquidation from this cause for several years was of immense volume. This is largely the cause of this decrease of beef cattle that now confronts the country. If this decrease is to be stopped, it will have to be done by the cattle raiser on the farm. Present conditions certainly invite the farmer to re-enter this neglected field of growing good steers. Good feeders have sold on the markets during late years at $4.50 to $6.00, and these prices ought to give a good profit for their production, even on high priced land. It has been said that opportunity knocks once at each man's door, and whether or not it be true that she knocks only once, a golden opportunity now awaits men of judgment and ambition who will enter this neglected field and revive the well nigh lost art of growing good steers. The price at which these can be sold, either as choice feeders or finished beeves, will certainly justify the effort.

Many years ago steers suitable for the feed lot could be found in almost any neighborhood. These steers were generally Short-horn grades, as the blood of this breed of cattle was very widely distributed, owing to the early introduction of Short-horns into the United States. The Short-horn cow, either pure-bred or high grade, makes an excellent mother for high grade steers, owing to her beef form and her milk production. Such cows can be found in many localities at moderate prices, as can also good cows of other breeds, and with the proceeds of two fat yearling steers the farmer can purchase a good pure-bred bull. So there is strong encouragement for farmers to begin growing steers and no serious difficulty in laying a good foundation for this profitable adjunct to successful farming.

The choice of breeds must be left to the farmer who may decide to undertake raising steers. Some breeds are better than others, but there is room for all good cattle. The one thing that is essential is for the farmer to get a good bull of the kind he prefers and not be content with a poor one. It is a serious mistake to think an indifferent bull is good enough to sire calves from which to make good steers. The only proper treatment of an indifferent bull is castration and when the breeders of pure-bred cattle

MR. COWAN, THE SHORTHORN ASSOCIATION'S "GRAND OLD MAN."

realize this and carry it into effect, they will greatly enhance the value of their good bulls.

It cannot longer be denied that there is a shortage in our supply of beef cattle. The range country has been so invaded by the homesteader and so many large bands of cattle have in consequence been sent to the markets, that ranchmen cannot in the future supply all the feeders needed in the corn belt. This shortage of feeders will be more keenly felt in the future than now, and will tend to enhance values. According to official figures the decrease in the number of feeders sent to the country from the five leading live stock markets during the last three years is 133,805. In addition to this deficiency of feeders sent into the country there has been an unusual slaughter of calves, especially during 1910. Speaking of this market condition, the Live Stock World says: "It is policy that can have but one culmination, a beef shortage that will elevate the cost of beef high above the reach of the masses."

So the consensus of opinion of those who have carefully studied this question is that the country faces a shortage in its supply of beef cattle. This will undoubtedly inure to the benefit of men who are breeding beef cattle, while the beef eaters will continue to pay high prices for prime roasts and juicy steaks.

HOLDING LIVE STOCK AUCTIONS AT HOME.

It will be only a few years until this country will be the scene of just such a series of successful pure bred cattle sales as characterized the years of '97 to 1902. And in this recurrence of a condition once experienced there is opportunity to save ourselves the repetition of a serious mistake.

In the heyday of the pure bred beef cattle business when prices were high and even heavy expenses left a good margin of profit, breeders got in the habit of shipping the public sale offerings to some good railroad point, thereby making the items of freight, labor, feed and risk about as high as it was possible to make them. This was justified of course in two classes of auctions: Sales in which the animals were of such value (through their prize winnings or outstanding excellence of breeding and individuality), that they had a right to attract breeders from a wide territory. And sales in which the offerings were good, but had been grown in outlying sections too thinly settled to make possible the gathering of a local crowd of buyers.

Sales of these two classes, however, were, and probably always will be, in the minority. The bulk of the pure bred cattle sold at auction is grown in good farming communities, which ought to afford a sufficient demand for all the suitable surplus that the local herds can supply. Frequenters of public sales have seen cases by the hundreds in which the seller's neighbors paid railroad fare to and from central selling points, and helped the seller to bear the expense of freight both ways, to say nothing of the heavy expense of selling away from home, when just as good prices could have been realized had the breeder made his sale right on his own farm. After prices of pure bred cattle went down the breeders had had a sad and expensive experience shipping their offering of "good ordinary" cattle to central selling points. The making of home farm sales have since gained greatly in popularity and for three or four years the big sale pavillions erected in various places over the country have been the scenes of only such sales as (mostly for the reasons given), could more profitably be held away from home.

There is a great oportunity, however, for further increasing the popularity of home selling. There are strong arguments in its favor, even in the case of the offerings of the very highest class. Men who buy like to see the cattle under normal conditions and this can be insured only when they are sold at home. Beginners and smaller men in the business count it a day well spent if they can visit the barns and pastures and see the breeding herds and study the treatment as they find them at the home of an older and more successful breeder. Many of them gladly spend not only the day of the sale, but often a day or two before the sale and a day or two following, making themselves familiar with the herd and offerings and perchance with other herds of the same neighborhood.

In the case of the man who breeds only the average class of cattle, as pure breds go, it is almost imperative that he not only sell at home, but that he develop a home demand. This can be done in various ways, and an ingenious breeder will think of good ones when once his thoughts are directed along that line. While he cannot afford to do without such outside advertising in good live stock papers of some standing as will insure him the interest of other breeders in the top things he has to sell, he can no more afford to ignore the possibility of developing a home trade which will take, at fair prices, the average of his offerings and everything below the average.

Gospel of Beef Production

Written for the American Breeder by Chas. Escher, Jr., of Botna, Iowa.

THE people of the United States have repeatedly been called one of the great, if not the greatest, meat eating people of all the civilized nations on the face of the globe. We have become a great beef eating people, because we have been purchasing beef below the cost of production. But strange as it may seem, beef never will be cheap again in the sense that it has been. Meat eaters have had their last opportunity to secure meat below the cost of production. The farmers of the great corn belt states have been selling their products for the past thirty years, either in the form of grains, or condensed into beef, pork or mutton, not mindful that they were selling their produce for less than the cost of production, when we account for the depletion of our soil fertility. All this he has done, and boarded himself and family for nothing.

With the exception of a few short periods, when prices reached abnormal levels, the business of stock raising and feeding never did yield adequate returns. But our capital has been wasted and on many farms it is very nearly exhausted, and by our capital I mean the fertility of our soil, which has been and must be our very essence of prosperity. If farmers of the corn belt states would continue to be prosperous, they must from now on look wisely to the fertility of their lands, in order to make a living and accumulate in store. In years gone by we have been selling our very soil fertility and now comes the time for a halt. Farms that have been robbed for the past thirty or forty years cannot be depended upon to bring bountiful crops; hence, to be prosperous from now on will require the rotating of crops and that will mean the growing of more grasses and then must follow the grazing of more cattle and by so doing, we can at least conserve what fertility we still have and add to it, if possible.

When I say that the consumer has seen the last of cheap grains and meats, I believe I am speaking the truth, and let me tell you why. As I said before, our farmers have produced grains and meats for the past thirty years at less than the cost of production and they are now beginning to realize the seriousness of conditions. From now on over-production, with our increasing population, will soon be an impossibility. The farmer will grow more grasses, keep more cattle, raise less cars of grain, but feed more of. This will keep up the price of grains and with a ten per cent increase in our population and a seven per cent decrease in cattle in the past ten years, it would seem that an over production in cattle will never again occur, as the breeding grounds of the great west have been mostly taken up by homesteaders and settlers.

The beef producer, to be prosperous, not only wants plenty of grasses and grains to grow good cattle, but he must have reasonable assurance that his business will not be handicapped by adverse legislation. We hear much at present about the high cost of living and the consumers who, for the past thirty years or more, have been living on luxuries produced on our farms at less than cost of production, will realize from now on that the high cost of living, or the cost of high living that he now complains about, is a self inflicted punishment and he and his ancestors will, in the coming future, pay the penalty. As has often been said, he who laughs last, laughs best. The corn belt farmer and his progeny, the men who have faithfully tilled and soil, will come into their own in the time to come, if we see that we have proper legislation.

With the advance in the selling price of beef (which has already made itself felt), as a result of an increase in population and a decrease in beef production, with a wide awake, enlightened agricultural people, who are earnestly interested in furthering the gospel of the conservation of the fertility of our soil and with intelligent corn belt farmers, anxious to convert all the roughness on their farms into fertilizer, I cannot help be optimistic from the cattle man's point of view, and see nothing but good returns for the cattle man in the corn belt states, if he will but act before it is too late.

I was taught to follow the old cow as soon as I was old enough to walk and I have been following her all my life and naturally I have learned to love her. She has more than a commercial value. She and her offsprings have proven to be the greatest of all animals to consume the roughness on the farm and transfer it into fertilizer, and the corn belt farmer, who attempts to reach the highest pinnacle of grain production without the aid of the old cow and her offsprings will very soon have decreasing yields of grain and greatly impoverished soil.

By utilizing all the roughness on the corn belt farms, which have been neglected; by raising more grass and better grass, by breeding good beef cattle and feeding them for market at an early age, beef cattle can be profitably raised on our corn belt farms.

At the recent international, it was my desire to ascertain what kind of bullock was most in demand, and having heard that the baby beef steer was the butcher's ideal, it was my purpose to make a thorough test, if possible, and the firm of Escher & Ryan placed before the judges, who are men of national reputation, two of as good loads of cattle as were ever shown in this country, one a load of 1500 pound Angus two-year-olds, and the other a load of handy weight Angus yearlings at 1200 pounds. And what was their verdict? The yearlings were winners over their older brothers, when other conditions were equal and at a time when heavy bullocks were much sought after. Baby beef should be marketed from twelve to twenty months of age and if fed from calfhood up, should weigh from 800 to 1300 pounds.

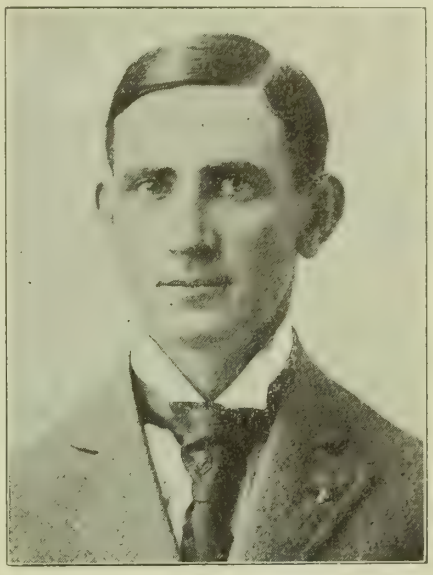
From this time on the corn belt farmer who would be prosperous and content, must rotate his crops, produce more grass and better grass, utilize his roughness by growing beef cattle. He can escape the drudgery of the dairying and other intensified agriculture and economize on labor; he can grow less acres of grain, but more per acre, and get better prices for our products, and last, but not least, he can increase the fertility of his soil, at a minimum cost and keep it working all the time

If you would be a constructive instead of a destructive farmer, begin now. Farm conditions have reached a period of transition and at this juncture beef production in the corn belt states needs encouragement, not repression, and those who heed the gospel of beef production on corn belt farms, will reap a just reward.

WINTER HELP TO HELPFUL BIRDS.

Something new, and certainly, gratifying, grew out of the state game conservation in Missouri as a result of the severe cold early in January. Jesse A. Tolerton, state game warden, sent out requests through his deputies, wherever the ground was snow covered, asking farmers to scatter grain for the quail until thawing weather uncovered their natural feed. The deputies were authorized to certify to the bills for this service to the state and they were made payable out of the state funds. It is doubtful if any farmers asked pay, but many acted on the sensible, not to say kindly, suggestion.

Some Facts About Galloways



Business With the Shaggy Blacks Indicates Better Returns for Beef Producers. Galloways at the International Outdressed Steers of Other Breeds, Which Had Cost an Average of $11.62.

Written for the American Breeder by R. W. Brown, Secretary American Galloway Breeders' Association.

WHILE the year 1911 was a lean year in crop production, a bounteous harvest in 1912 may start another era of industrial activity. There is a healthy undertone to the market for all kinds of farm produce, and there is nothing to indicate that prices will be depressed below their normal level during the coming year. This is especially true of beef products. Probably no agricultural work offers greater inducements at the present time than that of beef production. A shortage in beef supplies has been predicted for a number of years, but this prediction has not generally been accepted until quite recently. There is a scarcity of cattle in all sections of the country, and the outlook to the producer is most encouraging.

The business transacted in the office of the American Galloway Breeders' association during the last few months is indicative of an optimistic feeling among breeders of pure-bred beef cattle. The association's report for the last year shows an increase over the preceding year in the number of pedigrees accepted for registry and also an increase in the number of new members received. The significant feature of the year's work was the registration of animals over one year old. Registration in a measure is dependent upon a demand for pure-bred sires, and since the decline in beef production set in there has been a growing tendency among owners of pure-bred herds to abandon registration. In a great many instances only the animals that are sold for breeding purposes are recorded, and then only when the registration certificates are demanded by the purchaser. In 1910 we recorded a greater number of bulls over one year old than we recorded in 1909. In 1911 the number recorded was 25 per cent greater than the number recorded in 1910. Nearly all of these bulls were sold before they were recorded, and the fact that most of them were sold to men whose names are on our lists for the first time is significant of the growing popularity of Galloway cattle.

There are many other evidences of increasing interest in our cattle. Never before have we received so many requests for literature pertaining to the breed as we are receiving right now, and not in any recent year have the members taken a greater interest in the work of the association than during the year just closed. Significant also were the splendid exhibits of Galloways seen at the state fairs and live stock shows held during the year. The breed was represented at nearly all the state fairs from Oregon to Virginia, and it is gratifying to know that our exhibitors found ready sale for their surplus stock. At the Kansas City show alone more than forty head of bulls were sold at private treaty. Satisfactory prices were realized and exhibited are greatly encouraged by the unusually large number of inquiries they are receiving. There is a bright future for the Galloway. It is a breed especially adapted to farming conditions in the United States. Evidence of this is found in the history of the load of Galloway steers that was exhibited at the recent International. These steers were bred by J. F. Meserve in the short grass section of Kansas. They were exhibited by Mr. Meserve at the 1910 American Royal, where they were awarded first prize as the best carload of yearling feeders. After the show they were sold to Foster Bros. of Earlham, Iowa, who fed them out and exhibited them in the south central carlot division of the 1911 International, where they attracted considerable attention. They were sold at auction to the United Dressed Beef company at $10.75. With the exception of one or two single load purchases the United Beef company bought the highest priced cattle of the show, and of the five loads purchased by this firm at an average of $11.62 per hundredweight, the Galloway load dressed the highest per cent of beef, 65.10. There was nothing unusual in the preparation of this load of steers for

SECRETARY R. W. BROWN.

the show. They were purchased as yearling feeders on the Kansas City market and were finished in the corn belt by practical feeders of commercial cattle. Galloway cattle are popular with the butcher. They dress out well, and invariably receive high ratings in the carcass contests. They are also popular with the feeder, as is evidenced by the fact that Galloway calves right off the range have recently sold as high as $40 per head. The breed is well adapted to farming conditions in America, and there is every indication that breeders will find ready sale for their surplus stock in 1912.

THE CHAMPIONS ON THE COVER.

Many will be interested in knowing the names of the animals represented in our cover page design. Each animal has been a winner of championship prizes and is well known to the better posted people interested in its particular breed. The Galloway is Myrtle of Avondale 24942, successfully shown by W. M. Brown & Son of Carrollton, Mo., the son being now Secretary R. W. Brown of the Galloway Record Association. The Hereford is Scottish Lassie 305352, bred by Dr. James E. Logan and now owned by J. P. Cudahy of Kansas City and Belton, Mo., who showed her almost without defeat throughout the past season. The Shorthorn is Ringmaster 307894, shown successfully for the last two seasons by White & Smith of St. Cloud Minn. The Aberdeen Angus is Thickset Blackbird 115895, an Iowa bred bull that has seldom seen defeat and was shown last season by O. V. Battles, Maquoketa, Ia.

A new record in butter production has been announced. Pontiac Clothilde de Kol II, a Holstein, owned in the East, has completed a year's test, making 1277.6 pounds of butter, the milk from which it was made weighing over 25,000 pounds. This cow already had a 30-day record of 148 pounds of butter, and a 7-day record of 37.2 pounds.

TO OBTAIN BETTER BULL SERVICE.

A Colorado reader has had some difficulty with bulls not being producers, and asks how to buy bulls that will be prolific. There is little danger in buying a bull that has well developed genital organs, unless the bull has formed the habit of masterbation, or has been used too extensively. Age, however, seems to be more important with bulls than with stallions. This is due largely to the method of handling them. There is only one way to know whether a bull is a breeder or not, and that is through the use of the microscope. A microscope having power of from 100 to 500 diameters, can easily detect the spermatozoa, and will disclose the fact whether there are any movements or not. If there is no spermatozoa on first examination there is a chance that there might be spermatozoa developed at a later service. Younger bulls, especially, may require a few services before they are able to discharge live spermatozoa. This is even true of aged bulls, which have been proven to be excellent sires. That may be due to the lack of exercise and too much feed.

Most barrenness in young bulls is due to masterbation. A great mistake most breeders make is allowing young to use the same paddock where cows are served, or allowing young bulls to even associate with cows in heat before time for service. Young bulls should not be allowed to run with cows in heat, for the best results. A great many bulls are handled in this way successfully, but some of the best ones are spoiled with this same method. One service is just as effective as a number of services during the same heat period. There is no advantage to be derived and there is danger of injury to the bull. In one service there are thousands of spermatozoa, any one of which will cause fertilization if it comes in contact with the ova, the balance are useless.

Calves from a bull which is allowed a limited number of services are stronger, and the cows are more liable to be fertilized, and the bull will last longer by being allowed to make only one service for each cow at one heat period. If one bull is kept on the farm, a steer calf or two, smaller than the bull, may be kept in the same inclosure with him for company. All cows in heat should be kept at a reasonable distance from this inclosure. The bull should be kept in good, thrifty condition, but not allowed to accumulate a great amount of tallow. The inclosure should be as large as necessary for exercise. If there are several pregnant cows in a near by pasture which is fenced bull tight, the bull will fare better with this company. Valuable bulls (the only kind that anyone should keep) can be handled more profitably by allowing each cow to be served only once during the heat period.

The inquiring breeder does not state whether he wishes to buy one bull for a few cows or a large number of bulls to be used on the range. Ranchmen have reported good success from handling bulls in various ways, but it seems to be the opinion of most of them that the best results may be obtained by buying calves or short yearlings for this purpose. When introduced to a herd of cows at an early age the bull's ambition will not be quite so keen and they will have a natural tendency not to make too many services. As there are cows in heat most of the time, and their feed will not be sufficient to greatly influence their ambition. Bulls purchased at this age should have good care, as their growth might be greatly restricted without an abundance of good feed once or twice a day.

THE AMERICAN BREEDER

With which is combined
THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE
Editors.

Published semi-monthly (on the 5th and 20th of each month) by the
GRAHAM PUBLISHING COMPANY, INCORPORATED.
225 WEST TWELFTH STREET.
Kansas City, Mo.
BELL TELEPHONE, 4297 GRAND.

Advertising space for a single issue, $2.80 for an inch or less. For larger space or longer time, rates furnished on application.

Subscription Rates.

To all points in the United States and Mexico, per annum, 50c; 3 years, $1, payable in advance.

To all points in Canada, per annum, in advance, 75c.

To all foreign points (in the International Postal Union), per annum, in advance (6 francs, 5 shillings), or $1.15.

When sending subscriptions, please state whether they are renewals or new ones. Always renew under the same name and initials as previously used, and at least two weeks before your present subscription expires, so that you will not miss any number. When changing your postoffice address, state the old address as well as the new one.

Watch the wrappers on your paper. The month before your subscription expires they are stamped "your subscription expires with next issue," and on the following edition is stamped "your subscription expires with this issue." When the time for which the AMERICAN BREEDER is ordered has expired, it is always discontinued.

If you miss your paper please notify us at once and all lost copies will be replaced.

Entered as second class matter, November 23, 1911, at the postoffice at Kansas City, Mo., under the act of March 3, 1879.

All persons are warned not to reprint any part of this paper during 1912, without proper credit to the American Breeder.

BREEDERS' ORGANIZATIONS.

Nearly all over Europe breeders' organizations can be found, which are producing good results for improved live stock. Some of these are small, while others are national in their scope. Numerous organizations have been formed in this country and more of them should be formed. Much good can be brought about through closer relationship of those interested in the same line of business. Most of the organizations in this country are of the larger character, but there are too few county organizations.

Probably more real good can be obtained through county organizations than through the larger ones. It is not always possible for breeders to attend all the large gatherings, but there would be little excuse for any breeder not being able to attend a meeting in his own county. It is very easy to form a county organization. A few public spirited men can get together and set a date for the county meetings. The newspapers will usually announce dates and encourage this organization if properly requested. The men elected to the offices are, as a rule, public spirited and expect to devote considerable time to the improvement of live stock without direct compensation. But there should be more to these organizations than the electing of officers. They should do all they can to further the cause of pure bred live stock. Public speakers should be engaged of as high standing as possible. Every business to be successful in the end must be conducted on the square, and the members must have the same advantages as the office holders have, and all work together in harmony for the best interest of improved live stock.

We hope to be of as much service as we can to these small organizations as well as the larger ones. We want every reader of this paper to appoint himself a committee of one to report to this paper every breeders' organization he is a member of, or is familiar with, send us the name and address of the secretary. Tell us what the organization is doing and intends to do; why it was organized and how long it has been organized, and we will be glad to give such an organization as much publicity as we can.

We hope to see every county where good live stock is produced enjoying a permanent county breeders organization.

BEEF CATTLE PROSPECTS.

Since the beginning of this century a great change has quietly taken place in this country. Land values have greatly advanced. The large area of pasturage has been settled to a great extent. Land that was considered worthless is now inhabited and producing crops. In the state of Illinois, land that could be purchased at $50.00 an acre in 1900, is now selling for $200.00 an acre. Iowa land, at that time selling for $30.00 an acre is now worth $125.00 an acre. Kansas land that was priced at $10.00 an acre has changed hands at $40.00 an acre. The great Panhandle in Texas that changed hands at $1.25 an acre five years ago has advanced to about $15.00 an acre. These are only a few of the instances that have brought about a change that must require better live stock of all kinds and more especially will it increase the demand for pure bred beef bulls. Since 1900 the total live stock production of this country has increased 20 per cent, while the population has increased 30 per cent, and the population will increase very fast from now on.

The writer has visited numerous foreign countries where many of our emigrants originate, who feel very kindly toward this country as a future home. These people must eat, and from our education are not to be vegetarians, as the people from India are, nor are they taught to eat horse meat, as most of the people from foreign countries have been—with the exception of English speaking nations—but each of us have an appetite for flesh, and to satisfy it, we must depend largely upon beef or pork. Oleomargerine may to a certain extent, take the place of dairy products, and cotton seed productions may take the place of lard, but there is no substitute known to take the place of beef. Some of the wise heads are now looking for new fields to produce beef, as they realize that this country is inadequate under the present conditions. And the great demand for beef is for the better cuts. Both fashionable and common eating houses have agreed that the American people are demanding the best of beef, and therefore, it behooves us to produce a better type of cattle that will make these cuts in a larger proportion than can be obtained from the sunfish conformation which has obtained too largely in places where beef production has known neglect.

We can learn a great lesson from some of the older countries, where land is worth as high as $1,000 an acre, and yet much of it will be found in pasture. This same land has been farmed for a great many centuries and still produces under its present rotation of crops and pasture.

In this country land that for generations has been given over largely to one crop, is gradually decreasing instead of being built up. Live stock has done much for certain sections. In with these one crop territories occasionally we find a county, or possibly several counties where live stock has been bred extensively which seems to be of a different soil because there has been a reasonable quantity of fertility to be put back on the land. The foundation of all wealth in a nation is in the soil, and the cheapest and most effective fertilizer known to the average farming district is barnyard manure. If the $1,000-an-acre land can be farmed with cattle, how about our land?

While the ranges were being settled, a great many herds were dispersed and thrown on the market, which made beef plentiful for the time being. All dairy products have been very profitable and this has induced many American farmers to produce milking cows and in order to get the most milk, calves have been fattened and slaughtered at a very tender age. Dairy bulls have been used extensively, a practice not conducive to producing the best beef type. From the present indications the breeders of pure bred beef cattle are at the opening of an era of prosperity, but they are entitled to full encouragement for the years when beef cattle were not profitable. A great many breeders have hung to their herds through years of adversity, with the hopes of better times.

It is true that beef cattle on many farms have made good returns, but the pure bred products have not commanded the price they should, and that they are sure to command in the very near future. The American farmer must learn that it is not profitable to produce so-called beef cattle, that require four or more years to develop, but must raise the thick-fleshed, quick maturing cattle of the highest quality. The high prices that have been paid during recent years have never been handed out to the owner of "razor backs." It is steers that have the quality that bring the extreme prices.

The supply and demand frequently regulate the price of beef cattle on the markets, but it is the business of the producers of pure bred cattle to encourage the use of better sires in order to stimulate the market for their produce. These breeders who know the scarcity of good cattle will do the country a great service to encourage the use of better beef bulls everywhere.

A NEED OF LIVE STOCK CARETAKERS.

A great many herds of pure bred live stock are owned by wealthy men and much of the management is left to the hired help. There is a great deal of difference in employes. At a recent leading show a number of men who were at the show in charge of live stock were assembled together. Some of these men were drawing good salaries; others were not receiving so much. As a stranger to all, the writer began to ask questions in an easy way, to find out why some of these men were drawing double the amount received by others. In actual labor, if put to a test, one man could do about as much real heavy work as another. Those who were receiving the extra pay were men who had made a study of caring for their particular class of live stock. Some of these men were posted on nearly every subject concerning the production of better stock. This is one of the reasons that their employers were anxious to keep them with their stock.

But there is one special field that most grooms could be greatly benefited by, and that is by being able to diagnose certain illnesses quickly. One of these men told of an experience with a herd of high class show cattle, when several of the best ones died from pneumonia. He said he did not think there was anything seriously wrong with the cattle or he would have sent for a qualified veterinarian, but instead of that they continued to ship the cattle, and exposure placed the trouble beyond recovery. It is not our intention to make veterinarians out of readers, but we expect to start a department under the heading of DIAGNOSIS. We want our readers to study these conditions so that they may know the necessity of employing a veterinarian, when it is necessary, and before it is too late. Every live stock man should understand something about the symptoms of all common diseases.

Years of practical experience gives every man some new thought in live stock production, frequently an experiment proves beneficial or detrimental, and the result might be of much benefit to others in the same line of work. For this reason we solicit articles from practical caretakers of live stock for publication, that others may have the benefit of their experience. This applies more especially to the actual workers with improved live stock. A caretaker to be a success should be constantly studying the best methods of developing stock with the least possible expense.

"OUR NEW HIRED MAN."

One of the greatest difficulties in the conduct' of a general breeders paper that handles live subjects and upholds a reputation for reliability, is to find a man broad enough in live stock experience and thorough enough in newspaper training to handle, understandingly, and in keeping with their importance, the class of articles and correspondence which comes to the editorial desk of the American Breeder. Furthermore, on a paper where the editorial policy is supreme there is call for a man "on the desk" who knows the advertising end of the business as well. The constantly increasing demand on my time from every growing department of the paper, has been met, as far as possible, by enlarging an already efficient office force, and by employing additional specialists to aid me in those scientific investigations, the reporting of which to our subscribers has constituted an important feature of this paper since its foundation. Perhaps it is as much as anything, for the added freedom it gives me to pursue this scientific work, that I appreciate the assistance of our new hired man, whom this little mention will introduce, and whose name appears with mine on our editorial page. Forty years of the right sort of experience (the first 20 on his father's stock farm and the last 20 in agricultural college and agricultural newspaper work) have given me in Mr. Morse just what I have wanted for myself and the readers of the American Breeder—the services of one of the best posted and best paid men in live stock newspaper work. Years of work in the field has given him a wide personal acquaintance among breeders and an accurate knowledge of their business, as well as of their herds and agricultural conditions generally, and I flatter myself that the columns of the American Breeder already show evidence of this fact.

FRANK B. GRAHAM.

A CATTLE BREEDING DEPARTMENT.

Everyone interested in raising cattle, should know something about the generative organs of the cow and the bull, how fertilization takes place, when to expect results or failure.

We have decided to print illustrations showing all these organs, also drawings prepared by Frank B. Graham, especially for our readers. These charts will be plain, and will serve as a foundation for the cattle breeding subjects. A cattle breding department will be conducted in plain language, so anyone can understand it easily. Every reader will have the privilege of asking any question that they care to concerning breeding or other subjects. This will be especially valuable for all breeders to have their caretakers study.

Berlin evidently needs a Dr. Crumbine. Over 150 persons staying at a municipal lodging house for the homeless were made sick from eating smoked herring, and 57 of them died. If as many lives had been lost in a railroad wreck the news would have been spread by "scare heads" around the world. As it was, the brief dispatch telling about it, made secondary mention of the damage done to fish trade by the unfortunate occurrence.

PARTIALLY PERSONAL

The big gray wolf which invaded the city limits of Chicago early in January was finally identified as a timber wolf. It took refuge in a lumber yard.

Warren T. McCray, of Kentland, Ind., who is best known to the American Breeder's clientage as a breeder of high class Hereford cattle, is talked of for the governorship of his state.

Personally, we do not think much of the post card habit, but when it comes to putting out something as classy as the new "Kansas Day Card" just received from Secretary Coburn of the state's board of agriculture, "there is a difference."

Some farm paper style makers have gotten the idea that they can make their sheets more "personal" by dropping the definite article. We suggest, in the interest of euphony, and to make the papers seem even more "like folks," that middle initials be supplied, as, for instance, "Kansas H. Farmstead," or "Missouri K. Agriculturist." A paper thus named would be so human it could almost snore.

"No amount of serum," David Starr Jordan is quoted as saying, "ever can make a veterinarian out of a hog owner." And likewise, no amount of veterinary college instruction can ever give a "hoss doctor" horse sense. He has to be bred right or he'll never have it.

We are sometimes right in our location of a cause, and yet entirely wrong in our idea of how it produces a certain effect. We have "always known," for instance, that cold weather brings pneumonia—but until recently how many have realized that the cold caused pneumonia only by causing us to shut up our houses tight, and to breathe dead, germ laden air until vitality became low, membranes unhealthy and disease gained foothold?

Who says that college training develops students away from business acumen. The winter issues of the Ohio Agricultural College magazine are carrying about 30 pages of advertising each. We have seen "advertising sharks" who couldn't match that for a showing of "business acumen."

The other Sunday morning a Pennsylvania railroad train killed six servant girls as they were going to church in a hack. What an awful warning it would have been if they had been coming home from a dance.

Did you ever hear of an honest business that is disreputable? Well, the business of predicting the weather is in ill repute in some quarters just now.

One farm paper prints an article in its dairy department headed, "Succulency and Milk." We have only one suggestion; why not amend that heading to read "Succulenciousness and Milch"?

Congressman Victor Murdock is quoted as giving a livery stable driver credit for handing him one of his best tips on speech making. Which, doubtless, was no more than fair, for Victor probably had just told the driver how to handle his team.

Nat Spencer, of the Missouri and Kansas Farmer, opines editorially that farmers might just as well save themselves the expense of corn husking by feeding corn in the shock to the cattle, horses and hogs. Which leads us to suggest that Nathaniel include among the original investigations on thier "model farm" at "Lake View" for 1912, a series of experiments by which he may ascertain how a two year old heifer with a normal mouthpiece would go about helping herself to a 12-inch sample of 75-bushel-per-acre Boon County White, such as many a Missouri farm produces in an average year.

A PLACE LEFT VACANT.

Gatherings of breeders and stock men in many states will note from this on, the absence of a commanding figure and a kindly face, which they long have known. Colonel R. E. Edmonosn, who has been as long and creditably identified with the live stock interests in this territory as perhaps any other man, died at his ranch near Claude, Texas, last month. Born in Kentucky, his business of live stock auctioneer and sale manager took him early to Chicago, where for a number of years he was the manager of Tattersall's, at the time probably the biggest auction horse market in America. From Chicago he came to Kansas City, and for fifteen years has been a leading figure in pure bred live stock sales and business, not only here, but the country over. At the time of his death, Colonel Edmonson was president of the American Hereford Cattle Breeders' Association, and was extensively interested in the breeding of Hereford cattle on his 6,000-acre ranch. His body was taken for burial to Lexington, Kentucky, near the place of his birth.

ISAIAH DILLON DEAD.

Isaiah Dillon, the oldest continuous breeder of Percheron horses in America, and one of the very earliest importers, died at his home in Normal, Illinois. In 1855, when Mr. Dillon was but 22 years old, he began the breeding of draft horses and since that time the name of Dillon has always been more or less connected with the draft horse affairs of this country. Not only was Mr. Dillon among the first breeders and importers, but he was one of the early extensive exhibitors in this country. If he had done nothing else he would have been long ago famous for the showing made with the greatest of our early day Percherons, Imp. Louis Napoleon. In fact, it was said to be the purchase of this horse which established the fame of the firm of Dillon Brothers. Early in the sixties, showing the old horse and one hundred and twenty-five of his pure bred and grade colts, Mr. Dillon made an exhibit which probably has never been surpassed by one exhibitor for its interest or for the good influence exerted on the draft horse business. Mr. Dillon was born in Illinois, in 1833, making him nearly 79 years old at the time of his death. He is survived by Mrs. Dillon, and his sons, M. F., A. A., L. A., R. H. and a daughter, Jessie M. Dillon.

BANQUET TO PROFESSOR SMITH.

Just prior to leaving Nebraska for his new position in the Minnesota University, Professor H. R. Smith was given a banquet in Omaha, at which the Live Stock Exchange of South Omaha and other allied interests joined as hosts. At the head of the Department of Animal Husbandry in the Nebraska University, Professor Smith has been very active in the interest of cattle and hog improvement and better conditions for the men engaged in cattle and hog business, and there are a lot of good poeple in Nebraska who appreciate this kind of work.

DR. LUCKEY'S SUCCESSOR.

Following the resignation of Dr. D. F. Luckey, from the position of State Veterinarian, as announced in a January issue of the American Breeder, the Missouri State Board of Agriculture appointed as his successor, Dr. Samuel Sheldon. Dr. Sheldon, whose home is in Trenton, Missouri, has been a deputy state veterinarian for a number of years, and has been an important factor in the effective work of the department. Dr. Sheldon gives up a large practice at Trenton to take on the work for the state, and Dr. Luckey, retires to his farm and other interests after fifteen years of effective service.

HOW THE HORSE BUSINESS REFUSES TO WANE.

A significant light is thrown upon the horse business by the recent publication of figures gathered at the Cornell University of Ithica, N. Y. New York is supposed to be the hotbed of the automobile business, and certainly if there is a state in the Union in which the horse grower would be making a losing fight against the automobile manufacturer, it would be in this state of wealth, big cities and macadam highways.

New York is a horse consuming state, buying from the country further west 80,000 horses a year. It is stated that these horses cost in a year $16,000,000, or about $200 per head. This average price, which includes horses of all kinds brought in, is below the minimum price of heavy drafters, which in New York and elsewhere pay the producer the highest margin of profit. The figures gathered by the Cornell University show that light horses are being raised in the state to a marketable age at an average final cost of $145; medium weights at $160, and heavy weight horses at $175.

As the price of heavy drafters the past two years has ranged from $275 to $300 per head, it is apparent that draft horse production in the Empire state is on a mighty healthy basis. Ten years practically measures the time which the automobile has been recognized as a factor in transportation. And figures on the horse business in New York covering these ten years show an increase of 76 per cent per head in the price of horses marketed in that state. While it is probably true in New York, as it is or will be soon, in every other state, that a cheap quality of light weight horses will become a losing proposition, the horse business generally is no such a healthy basis that the recent "farmers' week" meeting at Cornell University saw the largest attendance of horse growers this institution has ever known, and resulted in an organization of a state horse breeders' association.

ILLUSTRATIONS THAT TELL THE TRUTH.

There is no longer ground for argument against the use of good illustrations in literature of any sort. In live stock papers where it is often necessary to portray a particular animal, or to give an accurate idea as to the animal form, or to illustrate breed and type characteristics, good illustrations are practically indispensable.

This agreed upon, there is still room for a great deal of study and effort in the accomplishment of satisfactory results. Twenty-five years ago we were just beginning to realize the possibilities of making cuts direct from photographs, thereby making available accurate and reasonably inexpensive illustrations. Prior to this time the pictures in nearly all the live stock papers were made from drawings, often more or less exaggerated. An artist would start out by making pictures fairly true to life. But flattery, in some form or other, proved itself too good a business getter to be ignored, and live stock artists were not long in learning that they could get more business by padding the ribs of their patron's bull, or by smoothing down the hips of his cow, or by otherwise making it appear that said patron was a breeder of practically perfect animals.

Like everything else which has a "run" these exaggerations reached an extreme which has caused a reaction, and now the demand is widespread for the use of photographs in live stock illustrations. People who read the papers seem to demand more vigorously than ever before that the pictures as well as the text tell the truth. And already breeders who have listened to these demands and have used the best obtainable photographic work in their catalogs and advertisements are getting the best results.

Only a few days ago an inquiry was received at this office from a subscriber who wanted the name of some hog paper which used "true illustrations" instead of "fixed up drawings." We could not give him the name, but promised him that the influence of the American Breeder, in hog business as in all other business, would be in favor of illustratons that tell the truth.

KANSAS CITY THE PLACE.

Talk of the last great live stock show at Chicago will suggest again to the thoughtful reader of this territory the peculiar and unequaled opportunity which exists for building a gigantic show of breeding hogs in connection with the American Royal. For years the management of the International, with means and enterprise second to none in America, has tried to build up a show of breeding hogs

But while the exhibits of draft horses and of breeding cattle have come to eclipse those of all the great fairs of this and other nations, the show of breeding hogs remains less than any of the state fairs of anything like first or second rank. It will probably always be so, and it is hardly likely the International management would have, at all, the co-operation of the hog breeders and the hog breed associations were it not for the fact that this country really has no other hog show that could be called national. December is the wrong time for a show of breeding hogs and the climate and location of the International are wrong for the time of year. On the other hand Kansas City is an ideal location for a national hog show. Hog breeders of Nebraska, Iowa, Illinois, Indiana, Ohio and Texas, to say nothing of the immediately tributary states of Missouri, Kansas and Oklahoma, almost are unanimous in saying they would like nothing better than a national show at Kansas City. It is pre-eminently the commercial and geographical center in the territory of greatest pork production development. Then, too, the time of the American Royal is ideal for a show of breeding hogs. The heat of the early fall is past. There has been time to bring the younger things to a point where they show what they are. It is long enough after the hottest weather for giving heavy hogs a "finish" with less danger of loss from heat. And it is long enough before the breeding season so that a breeder can show his most valuable animals and still have them in shape for service when the right time comes. The older exhibiting hog breeders everywhere in this territory have realized for years the superior advantages of the Royal for a hog show and a score of the best men in the business have at one time or another given their own time and money to help start the thing. But that is not the way, and nothing permanent can be achieved in that way. It is through the record associations (rightly considered the servants of the breeders) that their efforts must be made effective. Some are willing; some are not. Let the influence of the breeders be brought to bear on those associations that are not willing.

There should be publicity regarding the cold storage of foods, through monthly reports to some federal authority that would give them to the press, to the end that the people might know to what extent foods were being withdrawn from consumption.—From the 1911 report of the United States Secretary of Agriculture.

WHAT THE BIG BRAZILIAN PROJECT MEANS.

The recent formation of an enormous syndicate for the growing of cattle and other live stock in Brazil possesses an importance which seems to have been realized by but few of the papers which published the news.

There are no men better posted on the beef situation of the world than the American and Canadian capitalists who have put their money in this enterprise. When men who have made a life time study of beef production will seek another continent for pasturage, will invest millions of dollars in land and equipment and pay their manager a salary equal to that of the president of the United States, it means something to every farmer who has the facilities for growing a little beef himself.

To launch this enterprise in Brazil, the breeding stock which goes from the United States probably will cross the Atlantic twice, as the only steamship lines giving satisfactory service to South America sail from European ports. Very likely all machinery and other equipments will have to make the same trip. Men whose operations are as extensive as those of Murdo McKenzie, the man chosen to head the new enterprise, cannot transfer their entire business activities from one continent to another excepting at enormous expense.

Another great item of cost, which simply shows further the opportunities which these meat producers foresee, is the cost of suitable assistance to Mr. McKenzie. For instance $10,000 a year has been offered to an expert in hog raising to make his home for the balance of his life in this southern domain and to develop an industry practically unknown in South America. Proportionate expenses will be encountered in paving the way to an adequate supply of cultivated feeds, for it is not the intention of the company to depend upon grass alone for the making of beef, pork and mutton. The same facilities enjoyed upon this continent is the way of concentrated foodstuffs is to be provided for there.

The syndicate intends to export to Europe and to this end has sought the services of a noted government expert on meat inspection whose name and executive ability would at once command the confidence of all markets. It is understood that the salary offered this expert is $20,000 a year.

The syndicate has bought from the Brazilian government nine million acres of land excellently adapted for range beef production. Its headquarters in Brazil will be San Paolo, the capital of the state of San Paolo, which lies at the southern end of Brazil. Santosc is the port for San Paolo and it is 250 miles north of Buenos Aires. Eventually the syndicate will run its own line of steamers, with every up-to-date facility for refrigeration. The aim will be to produce chilled beef as the prospect is that Great Britain and Germany would not make any concession to Brazilian live beef even under such conditions as the best possible American scientific management would insure. The syndicate will start with the largest number of cows it is found possible to buy, but the capacity of the project is fixed at one-half million head.

If a condition exists which justifies the pouring of millions of dollars into the project which probably cannot be made to show proportionately important returns inside of five years, what must it mean to the farmers and ranch men of this country, who at a moderate expense, can put themselves in position to begin realizing, in a year upon the better prices and better demands which nobody now doubts are in store for beef producers.

Carey Act Land for Sale—Address M. P. Ward, Richfield, Lincoln Co., Idaho.

Pure Bred Live Stock Rates

Canada Encourages Improvement of Farm Stock by Half Rates. In This Country the Breeder is Practically Penalized. Railroads, Otherwise Progressive, Out-of-Line in This Matter.

THE United States is about the only country where pure bred live stock is developed extensively, that the railroads do not assist the breeder. In Canada, for instance, stock registered in recognized registry associations is shipped at one half the rate of non-registered stock. In this country the attitude of the railroads is doing more to retard the increase of well bred stock than otherwise.

The railroads are doing many good things for the agricultural cause; and it may be an oversight on the part of the management to discourage the production of pure bred live stock. For instance, if a stallion is purchased in Illinois and shipped to Kansas, the rate on the stallion, regardless of weight, is based on 3,000 pounds. A small or young stallion may be crated and sent by express, which in some cases is cheaper than shipping by freight. We believe that these conditions can be changed to the advantage of the pure bred live stock industry, and of the country at large. Only about one-half of one per cent of the stock shipped in this country is registered in recognized records. The proportion is so very small that the railroads would not be seriously affected, and it would be a great help in the improvement in live stock. No one can say that laws giving the breeder of pure bred live stock these privileges, would be special legislation or unconstitutional, for most other governments already are enforcing such rates in the interest of agriculture generally and with good results.

There is just one way to get these concessions, and that is for every one interested in pure bred live stock to appoint himself a committee of one to assist in this direction. No individual or newspaper man can bring about this condition, but if all take an active interest, much can be done in that direction. We want the breeders to express their opinions on this subject, as to what they think should be demanded and the proper methods of obtaining results. This must be started immediately as it will take considerable discussion to convince breeders generally that it is possible to get pure bred live stock transported in this country at one-half the transportation rates for scrubs. If necessary, we can carry on this discussion from now until Congress meets in Washington for the next term. By that time we can have several congressmen interested in this movement and ready to introduce laws which will give the pure bred breeder relief.

When the proper time comes we want every pure bred breeder to write asking for attention to this subject. The pure bred stock breeders are the progressive men in every locality. They have much weight with their legislators and can get these results if any one can. This is one of the reasons we are advocating county breeders organizations. These county organizations can be depended on for they are not liable to be easily influenced by some outside consideration as is too often the case with political men and bodies.

There is no reason why a great deal more live stock should not be sold by mail. There are lots of breeders who have established reputations for honesty and reliability, who readily could dispose of their surplus at fair values were it not for an attendant having to accompany an animal and travel in a box car or caboose. The majority of pure bred live stock may be produced east of the Mississippi, but the principal buying district is, and will continue to be, west of that stream. Some arrangement must be made whereby an animal can be shipped with more convenience in order to accommodate both buyers and sellers.

Every progressive farmer in the country can be made a power for this movement if the subject is properly placed before him. They all realize that it is best for them to use pure bred sires, and if the railroad companies will carry this stock at a lower rate, production will be encouraged until good, pure bred sires come within the reach of all. Mail order business in all clases of live stock should be carried on nearly as extensively as the mail order business in merchandise.

The writer happened to be on a Shorthorn cattle farm a few days ago, when sixteen head of excellent young bulls were castrated. It was partly this sacrifice of breeding stock which prompted the writing of this article. Any of these bulls would have improved the herd of the average farmer materially, and could have been purchased for little more than the price of first class steers. Who has been injured in this transaction? The man who produced the bulls, the possible buyer or the railroad company? Those who might have purchased some of these bulls that were castrated are now using inferior animals—their herds will not be improved, but will deteriorate. The party who castrated these bulls secured a number of expensive steers. The parties who have been deprived of their use may eventually declare that beef cattle raising is a losing game, and eventually be attracted to some other business, consequently reducing the shipments of beef cattle to the market. The soil on their farms will naturally deteriorate and the purchasing power of the community will be lessened, so the roads will not get as large shipments to it as they would have got had the pure bred cattle proposition been more profitable.

Following this chain of cause and effects will very shortly convince any one of the correctness of our stand—that laws facilitating the trade in improved breeding animals, far from constituting discrimination in favor of any class will be beneficial legislation in the broadest sense. On this basis we call for the backing of the breeders of this nation and promise our best efforts in their behalf. Our columns are open to discussion and we will appreciate the aid and counsel of all interested in the same cause. No temporary agitation can accomplish what we seek, but sustained effort along the right lines, will.

F. B. G.

Don't Have a Blind One

"VISIO"

An Absolute Cure for Moon Blindness

(Opthalmia), Cataract and Conjunctivitis

Shying horses all suffer from diseased eyes.

"Visio" will convince any horse owner that it will absolutely cure defects of the eye, irrespective of the length of time the animal has been afflicted. No matter how many doctors have tried and failed use "VISIO" under our GUARANTEE to refund money if it does not cure.

$2.00 per bottle, postpaid on receipt of price.

VISIO Remedy Ass'n, 2475 Calumet Ave. Chicago Ill.

ABSORBINE REDUCES FAT OFF **STOPS LAMENESS**

from a Bone Spavin, Ring Bone, Splint, Curb, Side Bone or similar trouble and gets horse going sound. Does not blister or remove the hair and horse can be worked. Page 17 in pamphlet with each bottle tells how. $2.00 a bottle delivered. Horse Book 9 E free.

ABSORBINE, JR., liniment for mankind. Removes Painful Swellings, Enlarged Glands, Goitre, Wens, Bruises, Varicose Veins, Varicosities, Old Sores. Allays Pain. Will tell you more if you write. $1 and $2 a bottle at dealers or delivered. Manufactured only by

W. F. YOUNG, P. D. F., 388 Temple St., Springfield, Mass.

Do You want the Finest Stock Ranch In the State of Missouri?

The BEST BARGAIN in the state for the price—price means QUICK SALE and FIRST money. 8,000 acres in one solid body—five miles long and 2½ miles wide; all under fence, eight or nine buildings, stock scales; 300 acres botton land in alfalfa, corn, timothy and clover; 5 springs—stream of water runs 1½ miles through this ranch; six thousand acres can be cultivated, the remainder will make good pasture land.

This ranch is located in Christian county, Missouri, ¾ of a mile from a good railroad town and 34 miles from the city of Springfield, a city of 45,000 people. Lead has been found on this ranch, and it is almost surrounded by lead and jack mines. There is also 40 acres fire clay on this ranch, and almost enough cord wood and mining crops to pay for it at the price. Over $30,000 worth of stock was sold from this ranch last year. Strawberry land adjoining this ranch is selling for $75 per acre, and the electric railroad survey from the Big White River dam runs through this ranch.

I own this ranch and consider it worth $35 per acre, but I am offering it for $15 per acre—good excuse for selling, which I can explain. It will take QUICK work at the price. Write or wire me for further information. Address the owner.

A. J. Johnston, Springfield, Greene Co., Missouri.

FARM FOR BREEDING STOCK

80 acres good bottom land, in Linn county, Kansas; 60 acres in cultivation, balance timber, 4-room house, small barn, corncrib, chicken house, etc. Good water, small orchard; 5 miles from rail road town, 8 miles from county seat; price, $3,600. Will take part or all in good breeding stock, jacks and jennets preferred. Must be priced right. **Chas. A. Galt, Mound City, Linn County, Kan.**

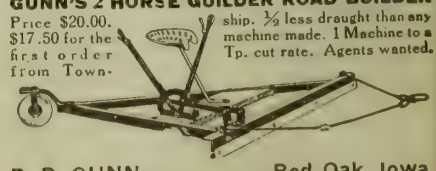
A GOOD BARGAIN IN THOMAS COUNTY LAND.

160 acres, 1½ miles from Rexford, Kansas. All lays nice; all broke out; all in wheat; one-third of wheat goes with the place. Price $20 per acre. Will carry $1,000, balance cash. **A. T. Loomis, Rexford, Thomas Co., Kan.**

Land For Trade

Good quarter section of land for some good Percheron mares, from yearlings up. **Freeman Bros., Neligh, Antelope County, Nebraska.**

AUCTIONEERS MAKE BIG MONEY



How would you like to be one of them and make from $10 to $100 per day?

We paid $300 for our 1911 96-page illustrated catalog. You can have one by writing us a postal today.

MISSOURI AUCTION SCHOOL
(Largest in world)
W. B. Carpenter, President.
Trenton, Mo., Kansas City, Okla. City.

GUNN'S 2 HORSE GUILDER ROAD BUILDER

Price $20.00. $17.50 for the first order from Town-ship. ½ less draught than any machine made. 1 Machine to a Tp. cut rate. Agents wanted.

D. B. GUNN, Red Oak, Iowa

Hotel Convention 12th and Broadway, Kansas City, Mo. Large, Airy Rooms, Good Beds. Special rates to students of the Graham Scientific Breeding School. Two persons in one full bed, 35c per day each. One person in a full bed, 60c per day. Good restaurants in connection and nearby. Take Observation Park street car from in front of Union Depot direct to our corner. Only a few minutes' walk to the school building.

JOHN R. WEESEN'S CHAMPION STEERS.

To the American Breeder:—I am mailing you the photograph of the steers on which I won the first prize for three-year-olds, at the last International in Chicago. I suppose you know they were first in their class (grade Aberdeen Angus) for three-year-olds and also champions over all breeds, for three-year-olds.

I cannot tell you just what kind of cows these steers were from, but the bull was a pure Aberdeen Angus, and I am told that the cows were very near full bloods. Of course they were Angus cows.

Now, as to the cost of these cattle, cannot tell you about what they cost, when I landed in Chicago with them. These cattle weighed 852, the first of August, 1910, when I bought them, and cost $6.50 per hundred, or an average of $55.38 when I put them on feed. As you see, that makes about sixteen months I fed them. As I fed them with two hundred other cattle of more age, it is pretty hard to tell just how much they ate along with the older cattle.

But I will try to tell you how I feed cattle. I feed cattle with my troughs full of corn all the time, never letting them run low. Salt is always there and plenty of good water. The first winter these cattle were fed ear corn and plenty of hay and had a shed to run to, on pasture of 230 acres. When spring came, I just left them in this pasture until they were loaded out for Chicago.

Now, as to the way I finished these cattle. The last eight months they were fed shelled corn and ear corn, always being plenty in the troughs. In addition to corn, they were fed alfalfa meal and the last month they were fed Champion Molasses Feed from Tarkio, Mo.

When the steers sold in Chicago, they averaged 1,674 pounds and brought $12 per hundred or $200.88 per steer.—John R. Weesen, Moniteau county, Mo.

MR. WEESEN'S CHAMPIONS IN THE CHICAGO STOCK YARDS.

If a neighbor has a better beast than yours, give him the credit due—but to buy or breed a better one in turn, is up to you.

GOOD PRAIRIE HAY

Will sell in car lots to suit purchaser. Buy direct and save commission. Write for prices. Also have two good Percheron horses and two jacks. Will sell or trade for young stock. **T. P. Heefern, Piqua, Woodson Co., Kan.**

Where Buyer and Seller Meet

Beef Market Recovering From Upset of Severe Weather Shows Scarcity of Supplies. Home Demand for Breeding Stock Reduces Receipts of Butcher and Thin Cattle. Hogs and Horse Trade Brisk.

A DISTINCT tendency towards scarcity has developed in the cattle market in the past two weeks. Such a condition has been anticipated for some time past, but whether the shortage would begin showing this early in the feeding season was rather problematical. Late December and early January movements were subjected to irregularities owing to weather conditions, but the supply was fairly liberal. With the rising temperatures of the past two weeks the supply did not indicate that many cattle were held back for lack of shipping facilities or inability to get to shipping points. The last two weeks of January showed a smaller supply than in the first two weeks, and the total supply at the five Western markets was about 30,000 short of the same month last year. The market, however, showed the direct effect of a badly conjested condition in the Eastern beef markets. Extreme low temperatures followed by a sudden thaw, caused considerable beef in transit to become in a state that made immediate disposition necessary. This was thrown on the market at the same time resulting in a $1 to $2 decline.

The conjested beef market sent prices of cattle down 25 to 40 cents, and in the past ten days nearly all the loss has been regained, though in that time prices have shown considerable uneasiness. Compared with a year ago prices are $1.25 to $2 a hundred pounds higher. The top price in the past two weeks was $7.90, and a year ago at this time the highest sale was at $6.65, and most of the cattle then were selling at $5.50 to $6.25. On January 30, four car loads of steers, fed 100 days at Langdon, Kansas, sold at $7.90. They had been fed 100 days and averaged 1,592 pounds. February 1, a car load from Franklin county, Kansas, weighing 1,425 pounds, brought the same price Other good steers in the past two weeks brought $7.50 to $7.85, and the bulk of all the steers offered sold at $6.25 to $7.25.

Compared with a year ago the cattle coming now are not nearly as good, and by way of comparison primeness now would have been classed as only good a year ago. The difference is in the feed bill, and a less suitable season for feeding. Rough weather, followed by heavy feed lots have made cattle on feed gain slowly, and both rough feed and grain are high in prices. Some strictly choice steers now would bring $8.25 or better, but cattle fed 120 days are the best coming.

Quanantine Cattle Fill a Gap.

But for the steers that are coming from oil mills in Texas and Oklahoma, there would have been a decided shortage in the receipts at Western markets. Most of the mills operate below the quarantine line and in January receipts from that section was more than double those of the same period in 1911. Owing to the large supply of cotton seed feeders were able to get long time contracts, at reasonable figures, and as soon as the first feeding was ready for market other steers were put in their places at feed troughs. Consequently there has been a steady stream of cattle from below the quarantine line. Most of them in the past two weeks sold at $5.50 to $6.30, and a few bunches at $6.40 to $6.50. They have made some money, but owing to the high prices for these cattle, the margin of profit was small. Colorado is sending in a rather limited supply of hay fed and sugar beet pulp cattle, and at no time in the next few weeks can be depended on for normal supplies.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$7.75@8.25
Good to choice steers	7.25@7.75
Fair to good steers	6.25@7.20
Common to fair steers	5.00@6.20
Meal fed, choice	6.25@6.75
Meal fed, common to fair	5.00@6.20

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice	$5.25@5.75
Fair to good	4.50@5.20
Common to good	3.50@4.40
Canners	2.60@.340
Heifers—	
Choice	$6.50@7.00
Good to choice	5.75@6.40
Plain to fair	4.75@5.70
Common	3.75@4.00
Veal calves	4.00@8.00
Bulls	3.25@5.50

Thin Cattle in Demand.

Demand for thin cattle is coming from those who want weighty steers fo immediate feeding and from others who want cattle to turn on grass in the early spring. Reports from the West and Southwest indicate that a good growth of grass is expected this spring and ranchmen are beginning to close contracts for spring delivery. Prices are said to be high, and there is little prospect for any decline. Good breeding heifers and stock cows are scarce.

The following quotations are for stock and feeding cattle:

Selected feeders	$5.80@6.25
Good to choice feeders	5.35@5.75
Plain to fair feeders	4.85@5.35
Selected stockers	5.65@6.00
Good to choice stockers	5.25@5.60
Plain to fair stockers	4.35@5.25
Stock calves	4.00@5.85
Stock cows	3.50@4.50
Stock heifers	3.75@5.25
Milch cows	35.00@85.00

Hog Prices Within Narrow Range.

Prices for hogs in the past two weeks were almost a duplicate of the preceding two weeks. In the first two weeks in January, prices ranged from $5.65 to $6 45, and the past two weeks about the same. Receipts have been liberal, but packers have been anxious for supplies, and for that reason there has been no decided slump in values. In January receipts at the five Western markets were 725,000 larger than in the same month in 1911. The supply, however, is being maintained at the expense of weight and average weight for January was 189 pounds, or 36 pounds less than in the same month in 1911.

Notwithstanding enormous marketing in 1911, which made total supply at Western markets for the year more than 17 millions, the government report of hogs in the country on January 1, 1912, as large as on January 1, 1911. However, market men have seen an indiscriminate marketing of light pigs, brood sows, and with large losses from cholera, they predict moderate receipts for the next two months. Packers take the same view as market men, and are buying the supply up rapidly. Had increased supplies been in sight for the next few months, there would have been a big slump in prices. Heavy hogs are selling at a premium because they are very scarce.

The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week
Mon., Jan. 29	$5.85@6.27½	$5.65@6.20
Tuesday	5.90@6.35	5.60@6.20
Wednesday	5.85@6.35	5.80@6.40
Thursday	5.80@6.32½	5.90@6.35
Friday	5.85@6.35	5.85@6.30
Sat., Jan. 27	5.85@6.25	5.90@6.25

The following quotations are for hogs:

Choice, 250@300 lbs	$6.20@6.35
Choice, 200@245 lbs	6.10@6.35
Medium weight	6.00@6.25
Light weight	5.60@6.00
Common to fair	5.00@5.75
Stags	4.50@6.20
Boars	3.75@5.75
Bulk of sales	5.85@6.30

Improved Demand For Horses.

In the past two weeks there has been a decided improvement in demand for horses and mules. Such an opening in the trade had been expected since the first of the year, but the extreme cold weather the first half of January checked the demand, and for a month prior to that time business was dull, owing to the holiday season. When demand began to revive there were plenty of horses and mules on hand, so that prices, though quoted some stronger have shown no material advance. Last week Chicago reported some hesitancy in demand, owing to the large supply offered. Here, however, the principal outlet channels seem to broaden, and inquiries are increasing from all directions. In the drafter line the east has been the principal buyer. There has been a good outlet to the South for both horses and mules. Construction mules have gone to California, and Texas and Oklahoma are beginning to look for farm mares and mules. An order is being filled for brood mares to go to Canada, and several loads of mules are awaiting shipment to the Dominion. The market is apparently on a firm basis, and with receipts held within reason, dealers see no reason why the market should not be maintained on a steady basis. As soon as spring farm work begins to open, there will be renewed inquiry, as many farmers sold short on working horses, to protect themselves against a feed bill.

Prevailing prices for serviceably sound horses and mules. 4 to 7 years old, are as follows:

Drafters, 1,700-pound up	$1[illegible]
Drafters, fair to good	135@160
Chunks, good	125@150
Chunks, fair	[illegible]
Southerners, good to choice	125@150
Southerners	75@125
Driving horses	65 up
Mules—	
13½ to 14½ hands	[illegible]
14½ to 15½ hands	[illegible]
15½ to 16 hands	[illegible]
16½ or better	190@2[illegible]

The following table shows re[illegible] of live stock in Kansas City less for this year, compared with the same period in 1911:

	1912	1911	Inc.	Dec.
Cattle	159,779	188,318	.....	28,539
Calves	8,828	17,430	.....	8,602
Hogs	366,202	236,455	129,747	.....
Sheep	2[illegible]	1[illegible]	[illegible]	.....
H & M	8[illegible]	[illegible]	[illegible]	[illegible]
Cars	12,445	12,508		

Hog Situation to Date

Cholera Control—Its Setbacks and Its Progress. Simultaneous Serum Treatment the Best Answer. Farm and Market Conditions Unusually Influenced by Past Season.

THE dry weather that prevailed so generally over the great corn belt during the fall of 1910 and season of 1911 made a favorable condition for saving the pig crop. Breeders were stimulated by the remunerative prices prevailing for fat hogs and bred heavily. Since then two unforseen factors have entered, which have naturally cut the profits that would otherwise have attended pig breeding, viz., high priced feed and hog cholera. The corn crop generally throughout the chief corn producing states was light last season and high prices for that cereal have resulted. Other feeds used in conjunction with corn have felt the upward trend and through sympathy have materially advanced.

Weather conditions have been unusually severe through January of the present year which has decreased the profits of winter pork production for many of those who had saved hogs to feed. There has been a general trend of hogs marketward for several months past, partly on account of the questionable profits accruing from putting costly feed into hogs at prevailing prices for fat stock. The present light average in weight at which hogs are being marketed is quite indicative that the price of feed is a factor in causing the recent heavy receipts at the chief slaughtering centers. The average weight for several months past at the Kansas City market has not reached two hundred pounds and has been a cause for much comment by those who make a study of the market.

Hog cholera appears to always be with us in some sections and the few infected areas that smouldered during the spring and summer of 1911, were fanned to a lively flame by fall of that year. Hog cholera became quite general all over the corn and hog producing states that fall, excepting some of the northernmost parts and did not subside until the coming of cold weather. The thousands and thousands of unfinished sows and little pigs on the markets daily were mute witnesses of the prevalence of the scourge. Nothing so promptly convinces a man that he ought to market his pigs as the presence of hog cholera close at hand or its sudden appearance in his herd. While many states have laws preventing the movement of live stock affected with any contagious or infectious disease, yet it has not been generally observed; the authorities seemingly being content with the thought that the market affords the only certain solution to the problem and that under the present rigidly enforced rules governing the inspecion of meat intended for food purposes, the consumer is protected.

The Federal government has, through its most learned scientists, made a study of the nature of hog cholera for years with a view of determining its exact cause and developing measures that would lead to its suppression. These investigations have been aided by numerous states as well as by private individuals.

The exact cause of hog cholera has not as yet been fully determined but it unquestionably is a disease of germ origin, as evidenced by its characteristic behavior. The germ thus far has defied identification probably on account of its very minute size.

It has been found that if the blood of a hog that has been treated in a way so as to make it very resistant to the disease be introduced into the system of a hog that is susceptible to the disease, that it will have the effact of preventing cholera in the latter animal. This method of preventing hog cholera has been found to be the most effective and practicable of any method yet devised and the thousands of hogs that have been vaccinated, and unquestionably saved from the disease during the past season, testify to the effectiveness and merits of properly applied serum treatment.

Like all newly developed methods of controlling disease the system has not been perfected as to details, but the principle upon which it is founded is good and we predict that within a short time all the details will be worked out so that the use of serum for the prevention of hog cholera will be reduced to the same certainty that vaccination against smallpox or preventive treatment for the bite of a rabid dog has attained in practice. The mission of serum is in the line of preventing the disease, and while experiments have proven that it will aid in recovery in animals already affected, it should not be relied upon for that purpose.

There has never been a year when so many carefully conducted autopsies have been made by competent men as the past season and it has been demonstrated that not all hogs that have been dying in numbers have succumbed to hog cholera. Other diseases have been found prevalent and sometimes mixed with cholera, so that when serum has been used in such cases the outcome has been very disappointing. The logical plan for serum is against cholera and when used in infectious pneumonia or herds infected with worms, will prove of no value. It requires expert knowledge in one making a post mortem examination for the purpose of determining the true nature of the disease present and such an examination should always precede a contemplated outlay for serum.

It has been a mooted question as to how long the serum treatment alone will prevent the disease and it has been found that the period is too short to be effective when an outbreak has become general in a neighborhood. Cases have been recorded where serum alone has successfully checked the disease for from five to six weeks, at the end of which time it reappeared in the herd. Many herds

This is the last call for the

Public Sale of Lee Gross, Feb. 12.,

Stock Yards South St. Joseph, Mo.

A dispersion of a herd of this character affords an opportunity for the selection of superior individuals, and in numbers, that is seldom offered. All the great producing sows of the herd, the herd boars and the gilts—the result of careful and intelligent mating. Something over 50 head in all, and all bred for early litters. Twenty-five tried sows and twenty-five spring gilts. The sort that have made the Gross herd; the practical, money making kind; the kind with size and finish, and the kind that will make the buyer money.

Among the more important sows to be sold are LADY JUMBO 1st, by Big Price, the pick of all Dawson's great Jumbo sows; LADY WONDER 5th, the great Wheeler sow, dam of famous A Wonder litter, and said to be the largest sow on record; LADY MASTODON 96th, by A Wonder, a great individual and a great producer of herd headers. BESSIE K, by Kansas Wonderful Chief, one of the very best producers and mothers in the herd. Others by Long Wonder, Western Chief, Hadley, Expander, Long King's Equal. These sows are all bred.

THE HERD BOARS include EXPANSION'S SON 51539, by Expansion. There probably isn't another boar in service today that embodies to a greater degree the very essential points of size with quality than does this remarkable boar. Expansion's Son has everything to recommend him as one of the leading sires of the day; a 3-year-old, just in his prime. Also MISSOURI JUMBO 58268, by Prospect, by Big Prospect, dam Lady Jumbo 1st by Big Price, and he by the great Pawnee Lad. Anything the matter with that pedigree? And he breeds as good as his pedigree reads. A great line of fall pigs, the best Gross ever raised, are by MISSOURI JUMBO. A 2-year-old in March. This boar is a diamond in the rough. Also GROSS' EXPANSION by Expansion's Son, a choice yearling.

YOU CANNOT AFFORD TO MISS THIS SALE.

are protected for a longer period. Inasmuch as the use of serum is quite expensive at the best one is not justified in having to resort to repeated vaccinations, provided a more effective way can be employed.

It has been found that when a small amount of blood from a hog sick with cholera is injected along with an increased dose of serum into one in which an attempt is being made to prevent the diseast that that much more lasting immunity is conferred. The experiments thus far run to show that this immunity is inclined to become permanent.

The simultaneous method carries with it, however, some danger inasmuch as one is dealing directly with the disease in the form of the virulent blood being used, and in order for prevention to be effective, a mild form of cholera needs be induced. If the serum used is of proper strength or potency, it will hold in check the tendency of the introduced disease to assume a virulent form, but should the serum not be up to proper standard, there is danger of a positive outbreak of the disease sufficiently severe to kill. Should such occur the proper course to pursue is to promptly make further use of serum alone in increased doses.

It has been observed that not all hogs affected with cholera are affected in the same degree and should the usual dose of blood be used from a hog sick with a particularly virulent or severe form of the disease, it would increase the chances for producing the disease in a herd being immunized. It is very difficult for those engaged in producing serum to always determine the exact degree of virulency in a hog whose blood is to be used in the simultaneous method. A generous use of serum should always be made when this method is utilized, so as to be sure of prevention.

The simultaneous method affords the best solution to the problem of suppressing hog cholera and when perfected will be the method employed. Specialists are working on the problem and as stated above, we look for its early and satisfactory solution. With this attained one of the great scourges that almost yearly menace profitable pork production will be controlled.

PURE BRED HOG SALES OPEN UP.

The public sales of pure bred hogs are making a good start. The offerings, composed almost entirely of bred sows, are generally presented in only moderate condition, and meet with a substantial demand.

In Northwestern Iowa and Northeastern Nebraska, where cholera has been much less prevalent than farther South, hog sales are fairly abundant. In ten or a dozen Duroc Jersey hog sales, of which we had reports from this section in January, about 500 sows and gilts, bred mostly for March farrow, sold at a general average somewhat above $35 per head, the sale averages varying narrowly, mostly from $31 up to $37.50. In only a few cases did single animals sell as high as $100, and the indications are that bred sows of this breed will sell higher as the season advances.

From the same territory we received reports of only about half as many Poland China sales held in January. The hogs in these sales, however, sold for somewhat better averages—$35 up to better than $50. In all about 250 bred females averaged about $43. There was no apparent difference in healthfulness of demand, for the two breeds and the natural inference is that the Polands are bringing more money, chiefly because the supply is relatively shorter.

Questions and Answers

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

INJURED CALF—I have a Hereford calf six weeks old that has got a sore at the navel. I think it started to heal all right after the calf was born, but that coldest weather we turned some shoats in the barn with the cows and I think one of them might have bitten it. The sore does not seem to be in bad condition but I want to be sure it does not reach the calf's insides. I have put carbolated vaseline on and covered it with a white bandage reaching all around the calf's body. What else shall I do?—Kansas Subscriber.

REPLY—From your description we would judge that your calf has not been seriously injured and it is very likely that the wound will heal under your present method of treatment. Should there be much swelling occur at the point or a bulging of the parts take place indicating hernia we would advise you to promptly secure the aid of a competent veterinary surgeon.

TAIL BITING—I have a young sow that has gotten into the habit of biting off tails. She had bitten four or five other hogs in the lot before I noticed it, and I have her in a separate pen. She is a registered Berkshire and one of my best, and has been bred to farrow the first of April, so I do not wish to butcher her. Do you suppose she will forget the tail biting habit if I keep her away from the other hogs several months?—Missouri Subscriber.

REPLY—Tail biting is a habit closely related with chicken catching, and when once formed is difficult to break up. It generally develops during the winter season when hogs are kept in close quarters and do not have access to range, so that their appetites may be satisfied. It is very likely that if your sow is kept in a roomy pen by herself and fed a well balanced ration with access to salt, ashes, charcoal, etc., and given range of a pasture in the spring that she may not then be inclined to annoy her mates. We would suggest that you make an attempt to supply her with proper diet before farrowing, lest she may eat her pigs at that time.

FROZEN EARS—An Aberdeen Angus cow that I bought last fall dropped a calf for me during that coldest weather. We took the calf in the house and did everything to keep its ears from freezing, but I find they are frozen a little around the edges. I expect the calf to be valuable and would like to fix it so the scarred edge of the ear will not show. Will I need to cut away the edge that was frozen or will some other treatment help the ears to hair out so as to hide the frozen place.—Iowa Subscriber.

REPLY — The greatest difficulty with frozen ears is their unsightliness. The edges are not only often irregular but the margin is devoid of hair. A competent surgeon should be able to improve their condition by carefully dissecting back the margin of the skin and shearing away sufficient of the cartilage so that the skin may be brought together again and thus hide the present scar that is devoid of hair.

SWOLLEN JAW—Nearly a year ago we had two or three steers in a bunch we were roughing that developed small swellings along the sides of their jaws. The swelling seemed to be in the flesh just under the skin and all went away excepting on one steer, which we did not try to mark on that account. This steer has not done ex-

LAST TERM OF THE SEASON

GRAHAM SCIENTIFIC BREEDING SCHOOL

FEBRUARY 15 TO 23, 1912

¶ Eight days and nights of practical lectures and demonstrations, by the best authorities, on horse breeding subjects. ¶ Money cheerfully refunded to any dissatisfied student. ¶ Successful graduates all over the country, who have doubled their per cent of foals, and are doubling their income without increasing their investment.

500 Mares can be bred to one stallion with the latest method, and get a greater per cent of foals than can be had from breeding 50 mares with the natural service to the same horse

¶ Learn to detect disease that can be transmitted from one mare to the other by a service. Stallion or jack owners lose hundreds of dollars every year by breeding diseased mares, that require an educated man to detect. ¶ Come to the next term of School and see these mares dissected so you can tell one when you see it. ¶ There are dozens of subjects thoroughly discussed in plain language, of great value to all breeders.

Did you ever hear of a dissatisfied student from this School? No! They all get more than they expect. Nearly all say they didn't know there was so much to learn or of such great value to them.

Board and room from one dollar to one dollar and a quarter a day. School in first building north of Convention Hall. Take Observation Park street car at Union Depot; get off at 12th street and walk one block East. **Tuition is $25, which entitles all students to a free return privilege for life.** ¶ For other information address

The GRAHAM SCIENTIFIC BREEDING SCHOOL

225 West Twelfth St., Kansas City, Mo.

tra well but still seems to be in reasonable good health. The swelling does not seem to bother him a great deal. We do not know that it ever got to a point where it broke as I did not notice it much until I was cutting the other steers out to ship. This steer is kept away from the other cattle in the lot with the mule colts. I thought if he got all right I would fatten him. I do not believe it is a case of lumpy jaw, as his jaw seems to be all right on both sides.—Missouri Subscriber.

REPLY—It does not appear from your description that your steers have been afected with actinomycosis or lump jaw, for the reason that that disease is not inclined to disappear without treatment. The fact that the swellings are confined to the soft tissues, and that the bone itself is not involved does not prove that it is not lumpy jaw, however. Search the interior of the mouth for wounds of the mucous membrane and note the position of the teeth. If no cause for the swelling can be found, apply to the swelling, after clipping the hair from the part, a blister compound of the following: Powdered cantharides one part; lard four parts. Mix together and apply with the hand, rubbing in well. Apply a little fresh lard to the parts daily for a week or ten days afterwards and repeat the blister in three weeks if the swelling does not subside or soften so that it may be opened.

OBSTRUCTED NASAL DUCT—I have a colt foaled the first of April, 1911, being now a little over nine months old. She was foaled sound and remained so until four or five months of age, when her left eye began to discharge the tear flow and matter, sometimes the matter would cease and the tears flow gently over the corner of the eye as if the lachrymal or nasal duct was closed, but I have noticed of late that some days the eye would be perfectly free from matter and also the tear flow as in her other eye which is sound in every respect, and perhaps the next day the discharge would be slight, and perhaps upon the next day the discharge would be as heavy as ever. But take it for a whole week the eye seems better than it did a month ago and very much better than it did two or three months ago. Is there not some chance that the lachrymal duct is in working order? I have closely examined the eye and can find no diseased place in it. It is a good clear eye and looks inside and out just like the other sound eye in her head. She holds her head erect and does not seem to notice her eye a particle. Why it is the eye discharges at times and is dry at others, while both eyes look healthy, natural and in good order?

REPLY—Your description indicates that the nasal duct is somewhat obstructed, which may be due to the mucus from the eye passing into and clogging it. It may be carefully washed out from below with a warm saline solution using a teaspoonful of common salt to a quart of warm water. Use a saturated solution of boracic acid in the eye two or three times a day. This solution may be applied with a small medicine dropper.

PASTURE FOR JACKS—What is the best to sow for early spring pasture for two jacks that I will use the coming season? State when to sow and how to prepare soil for same.—Arkansas Subscriber.

REPLY—Plough the land early in small lands having numerous dead furrows so as to keep the lot dry. The outlet for these furrows should be kept open, so that the water will run off easily. If your lot is large it should be sown to grass, which will not produce much pasture. If it should be smaller, a crop should be sown, which would afford more green stuff. The object is to keep the grass down so that the jacks will exercise in order to get much feed. The kind of grass grown in your section should regulate the grass you will sow, but it is better to use a variety, so that there will be green stuff during as much of the year as possible. Sow grass as early as possible. If your lots are large it will only be necessary to sow a part of it. It is not good for breeding stock to have too much green feed. It will be necessary for you to fix a soft place for the jacks to roll. This should be dug up every few days and kept loose, otherwise the jacks will use your pasture for a place to roll, and destroy the crop. All jacks should have a good, soft place to roll every day, if possible.

UMBILICAL HERNIA—One of my last year customers had a colt with a rupture at the naval cord. I first saw it when the colt was two months old. I advised him to get a veterinary and have him operated on. What would you advise?—North Dakota Subscriber.

REPLY—If an enlargement at this point does not disappear in a colt after a few months, it should be operated upon by a competent surgeon inasmuch as they are much more difficult to treat successfully as they grow older.

RANK STALLIONS—I have a registered horse that will be six years old in May, weighs one ton. When he was two years old I bred him to five mares. At three years old I bred him two and three times a week. At four years old I bred him once a day using the capsule system. At five years old, once a day, using the capsule system. He has always proven to be quite sure. Just before and during the breeding season I traveled him from two to six miles a day in a cart. I had a nice lot to exercise in during the day. I kept him in good breeding flesh (not too fat). Along the last part of the season he would get ready and make a nice cover apparently and come off proud and never ejaculate. He would have to make a second cover. Can you tell me what is wrong with the horse. —Oklahoma Subscriber.

REPLY—You have been doing too much teasing with your stallion. If you are compelled to use him as a teaser try the mare that is to be bred and then put the stallion in the barn for a few minutes. Have the mare all ready, then bring out the stallion, and let him mount before the erection is too severe. If you are not using a breeding schute let the mare take a few steps during the service if she cares to, then allow the stallion to stay on, just as long as he will. The penis fills with blood which causes the erection. If it is filled extensively for a considerable length of time certain parts of the penis becomes numb and will not perform their natural functions. You have been taking extremely good care of your stallion and he responds to the good treatment. You have probably been tying your stallion in a stall near mares, which have excited him more than is best.

PIN WORMS—I have a valuable brood mare that has been affected with pin worms (about two inches long)

SADDLE HORSES

Of the most fashionable Chief breeding; yearlings and two-year-olds. Two mares in foal at a bargain. **J. A. Tuttle, DeSoto, Jefferson Co., Mo.**

REGISTERED MORGAN HORSES

FOR SALE—Coming 2, 3 and 4-year-old stallions of large size, fine breeding and great style and action, high headed, clean boned and heavily muscled—the greatest all-purpose horse the world has ever known: fearless and untiring goers, but so level-headed that any lady can drive them: The Admiral 4871 A. M. R., 15¾ hands, weight 1,250 pounds, at head of stud. He was sired by Jubilee De Jarnet. Prices moderate. Send for catalogue.

RICHARD SELLMAN,
Mountain Vale Ranch,
Rochelle, McCulloch County, Texas.

Priced to Sell

Oscar Edwards & Son of Hillsdale Stock Farm, have some choice saddle stallions and mares. A couple of Percherons, and some of the best jacks and jennets that grow. Show stuff and prospects. Guaranteed to be as represented. They breed Duroc Jerseys, too. Write them. **Box 402, De Soto Jefferson County, Missouri.**

Land For Percheron or Jack Stock

320 acres of farm land in Oklahoma to exchange for registered Percheron mares, stallions, jacks or jennets. Address Geo. H. Dodson, P. O. Box 502, Oklahoma City, Okla.

Hackney Stallions All Ages

—ALSO—

A Few Choice Mares For Sale, By,

F. O. BUTLER

Hinsdale, DuPage County, Ill.

GALBRAITH'S CLYDESDALES

Famous the world over for three-quarters of a century. Present stock the best we ever had. No tail ends. Every horse we have is a show horse.

More international prize winning stallions over three years old for sale in our stud than all competitors combined.

Remember the Clydesdale is the coming popular breed and has won 80 per cent of all leading prizes in competition with the best of every other draft breed at Chicago.

ALEX GALBRAITH & SON, DeKalb, DeKalb County, Illinois.

CLYDESDALES

Of excellent quality a specialty. Both imported, and our own raising, from imported stock. The largest selection of registered stock in the West. ¶ Send for our booklet giving photographs and descriptions,

John Leitch

Lafayette, Stark County, Illinois

Royal Belgians

Imported and home-bred stallions and mares; first and second prize winners at Hutchison State Fair; from the best known strains; for sale at "live and let live" prices. Every horse guaranteed as represented. For particulars, write, or better, come and see. **David Cooper & Sons, Freeport, Harper County, Kansas.**

FAIRVIEW STOCK FARM

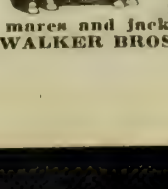
25 Mammoth jacks from weanlings to 8 years; largest breeding herd in the West. Herd headed by the great Pharoah 2491, Champion of Tennessee in 1910.
H. T. Hineman, Dighton, Lane Co., Kansas.

Company Jack Cheap

We have a black jack, white points, 15 hands, 6 years old, colts to show. Will sell cheap to settle company's affairs. Good server and sure.

H. L. Baird, Edwardsville, Wyandotte County, Kas.

STALLION AND JACK



For Sale—Grade Morgan stallion; an extra good foal getter and finest of dispositions. Also jack, black with white points; good breeder and good disposition. Can show colts from above stock. Easy terms. Write for further information. **Carl Lindstrom, Vinland, Douglas County, Kansas.**

FINE PERCHERON STALLIONS

From coming yearlings to mature horses, at low prices, breeding and quality considered. Have not been fatted and stuffed to injure them, but the younger ones have been out in stalk field all winter. Would take some good jacks as part pay but would accept nothing under 14½ hands, standard measure. **A. J. Robnett & W. B. Lacey, Farina, Illinois.**

STALLIONS AND JACK

Percheron Stallion, Mignon 33128; weight 1,850 lbs., color red roan, for sale. Also one Saddle Stallion, coming 2 years old. One Jack coming 10 years old; weight 900 lbs. I am going to move to South Dakota and must sell this stuff at once. **Joe Donnelly, Blaine, Pottawatomie County, Kansas.**

Extra good imported and home bred **Draft and Coach Stallions** from $800 to $1,400, 2 to 5 years old, including many state fair prize-winners; recorded in U. S. approved books (not recorded grades) and fully warranted. Also **mares and jacks.**
WALKER BROS., Oklahoma City, Okla.

SIX STALLIONS

Clydesdales, and a Morgan. All of breeding age and of the best breeding. All broke to harness and used on the farm. All have won prizes at county and state fairs. Those that have been tried are extra good breeders. Prices very reasonable. Correspondence solicited. **Painter Bros., Middletown, Henry County, Indiana.**

FIVE BLACK PERCHERON STALLIONS

Percheron stallions and mares for sale. Five stallions of breeding age, all black. This stuff is all home grown.

L. M. Phelps, W. D. Phelps, Trumbull, Clay County, Neb.

LIMESTONE RIDGE FARM

Has for sale one bay 3-year-old saddler; one black 6-year-old Percheron; $700 will take these two high class stallions, that are right every way, and the right kind.

Also three jacks, 3, 6 and 8 years old; one gray; two blacks; as good blood as Missouri and Kentucky grow; proven breeders; prompt to serve; $1,000 takes these 3 good jacks. Will price separate. To see this stock will prove the price is right. Have more stock to sell. **Isaac C. Lohman, R. 3, Turney, Clinton County, Missouri.**

Farm 5½ miles south of Cameron; 35 miles east of St. Joseph, and 54 miles northeast of Kansas City, on the Burlington and Rock Island Railways.

REGISTERED PERCHERON STALLIONS

ranging in age from 3 to 7 years, weighing from 1,800 to 2,240 lbs.; one dark iron gray 3 years old. One coming 3 very high grade, dark chestnut. All are heavy boned, sound and guaranteed breeders.
C. Satorius, Wynot, Cedar Co., Neb.

PRIZE WINNING STALLION

A registered black Percheron stallion, weight 1,750, not fat; first prize winner in this county; also his colts, clean boned and good worker. Girts 7 feet 7 inches. Sure foal getter. My reason for selling, I am too old to handle a horse and tired of the business. Price, $550. Come quick or he will be gone. **August Trudeau, Suring, Oconto County, Wisconsin.**

BELGIANS

Stallions and mares, over 100 head, Jan. 1, 1912. 24th year in business. Write for catalog. **Henry Lefebure, Fairfax, Linn County, Iowa;** 8 miles west of Cedar Rapids.

TO TRADE ON PERCHERON OR JACK

Or for sale for cash, a very fine French Coach stallion, imported by McLaughlin Bros. He will please any one wanting a Coach stallion.
A. V. Bowles, Texas Co., Licking, Mo.

M. T. BERNARD,

Percherons, Belgians and Shires

Grand Island, Hall County, Neb.

for several years. I have tried several worm remedies, which seem to stop them for awhile, but after a little while they are as bad as ever. The mare is in good condition and healthy, in foal due in April.

REPLY—Pin worms are rather difficult to get rid of for the reason that they inhabit the rectum, or back bowel. They are best reached by rectal injections of warm water containing agents like table salt, solution of quassia chips or sulphate of iron. If two thirds of a pailfull of warm water containing two thirds of teacupful of table salt is injected into the rectum occasionally it will free the bowel of these parasites. The difficulty is that fresh infections may again occur through the food supply. As a rule horses are not bothered much with any kind of worms after a short run on grass during the spring months.

Inasmuch as your mare is with foal we would suggest that you do not resort to any drastic treatment least you provoke abortion.

MAMMITIS—We are milking one of our Shorthorn cows because she had trouble with one-quarter of her bag caking. At the time of her previous calf the calf got more milk than he wanted from three teats and one teat he never touched and the cow seemed to hold up her milk when we tried to milk this quarter out. This time we took the calf off after the first day and are doing the milking ourselves, but the part of the bag which bothered us before threatens to do so again. No lumpy milk has come from it yet but it is inclined to get hard. We have done nothing more than to give it a little extra attention when milking, but would like to know some good treatment that will free it from this trouble, So far the rest of the bag is all right. —Texas Subscriber.

REPLY—We suspect the quarter complained of has already been injured to a point where it cannot be fully repaired, and efforts should be in the line of preventing an extension of the difficulty. If the parts are very painful good results may be obtained by applying water as hot as the animal will bear it to the parts two or more times a day for twenty or thirty minutes at a time. The effect of the application can be enhanced by placing a broad bandage about the body in a manner so as to support woolen cloths which may be tucked about the affected quarter. These cloths may then be kept wet as above directed. After the hot application the bandage may be removed and the part thoroughly massaged and milked out, so as to favor the absorption of exudate in the deceased part. This massage must be in proportion to what the animal will stand without causing great pain. At this time a preparation composed of soap liniment three parts, and water one part, to which one ounce of fluid extract of belladonna has been added to each pint, may be applied and rubbed in.

SCROTAL HERNIA—A year ago last fall we were showing some of our best Poland China sows and had them quite fat. The best one of them did not get in condition to breed until spring, but got a fine litter of September pigs from her. The best boar pig of this litter now shows that he is ruptured behind, or else has some swelling and I suspect it is rupture. The pig would be valuable if we could cure him. If that is possible, please tell me how to proceed.—Nebraska Subscriber.

REPLY—There is no way that we know of by which a scrotal hernia can be relieved except by an operation, and it will require the services of a very competent surgeon to do this in a pig without having to resort to castration on the affected side. Such an operation would require extreme care in order to prevent infection of the scrotal sack, yet in a valuable pig it is well worth while. In the event castration has to be resorted to it does not necessarily mean that the pig will be of no value as a breeder, for animals will breed when only possessing one testicle. This fact should always be borne in mind, however, and that is, that weaknesses are transmitted to the offspring, so that a ruptured sire may beget pigs more subject to this annoyance.

YOUNG BULL—Our herd bull lamed himself from falling on the ice and it has been a month since we used him. We have a young bull that is just as good an animal and no kin to our cows. He is 13 months old and weighs about 1,000 pounds. Is in pretty good flesh. Would it be all right to begin using the young bull now, and to what extent? I do not want to do anything that will interfere with his proper development.—Kansas Subscriber.

REPLY—The young bull has reached an age where he may be placed in moderate service inasmuch as it appears that you are by circumstances forced to use a younger bull than you otherwise should for the best results. The number of cows to which he may be bred with safety depends very much on the manner in which he is kept and handled. Be very careful that he is not only properly fed but also properly exercised and that he is used very moderately. He ought to serve from twenty to thirty cows during the season without harm to himself if he is properly cared for. We have known of a greater number being bred in several cases, but one should take no chances of injuring a promising young animal or encouraging weaklings among his offspring by overtaxing his power.

FISTULA FROM TAPPING—I have a cow that has a running sore on her side where she was tapped with a trocar last summer to let out the gas. She had bloated on clover pasture and the man who was looking after the cows tapped her with this trocar which I had bought several years ago, but had never used. We kept her off the clover and did not have any more trouble from bloat, but the wound never entirely healed and now there is a lump there about the size of an egg which runs a little matter nearly all the time. I have done nothing for it. What would you advise?—Missouri Subscriber.

REPLY—It is quite likely that you will need the attention of a qualified veterinarian in this case, for the reason that it will perhaps require a little careful surgical work in order to remove the cause of the wound not healing. We would suggest that you procure the services of such a man, for one can do an immense amount of harm in cases of this kind by doing the wrong thing.

BROKEN HORN—I have a good roan Shorthorn bull that broke one of his horns down by catching it under a brace in a gate. The horn is not broken clear off and does not hang down but is loose and has bled quite freely. I put tar around the broken part to keep the cold air out and bandaged it up some trying to keep it back in its original condition. I would like to keep it from drooping to spoil the looks of the bull. I will appreciate any suggestions.—Nebraska Subscriber.

REPLY—It would appear that the horn does not need any great amount of support—just enough to prevent its movement so that it will have an opportunity to unite. We believe this can be attained best by supporting it from the other horn. A light, strong stick can be properly shaped and secured to the sound horn near its base by means of plaster of paris bandages. It would be well to fit a triangular piece of wood into the space between the horn and stick on the side next to the injured member for the purpose of giving it a better bearing and preventing it from slipping. This should be done sufficiently long to permit the material to harden before the support is removed at the other end to the injured horn. One should bind the stick to the sound horn in such a manner so that the other end stands a little distance above its mate, so that when the bandage is later applied about the latter, it will be properly supported. The bandage about the sound horn must necessarily be tight to prevent slipping.

GAITING AGED STALLIONS—Is an ungaited pure-bred American Saddle stallion eight years old too old to successfully teach the saddle gaits?—South Dakota Subscriber.

REPLY—A good saddle horse trainer should develop some of the saddle gaits in your horse, but it will be more difficult and take much more time in a horse of this age than in a younger one. A great many of our best show stallions do not have all the natural gaits.

ABORTION—I have a four-year-old imported mare that aborted January 2. This mare had never had a colt before, and have been feeding her clean prairie hay, ground oats and a little bran and corn fodder. I put a lump of

Public Sale of Percherons

W. L. PARR,

Ruskin, Nuckolls County Nebraska.

IMPORTED AND HOME BRED PERCHERONS and BELGIANS

I am offering for sale at my barn a number of stallions weighing from a ton to 2,200. Not fat, just in breeding shape. Anyone wanting quality and bone, visit my barn. Two's coming three's weighing from 1,850 to 2,000. Imported horses from $700 to $1,000. Home-bred from $500 up.

P. J. EGGERS, Denison, Crawford County, Iowa.

Dapple Gray Percheron

Six years old; weight 1,900. Registered, P. S. of A. Smooth, sound and heavy boned; good action, high head, sure breeder; colts to show. Have no use for him. Horse can be seen at Robert Brown's farm, 6 miles from Anthony, Kansas. $600, part trade, balance cash. **W. K. Shaw, Garnett, Anderson County, Kansas.**

Shire Stallion

One extra good heavy boned, imported English Shire stallion. Black with stripe in face and white feet; 3 years old and sound. Well broke to harness. Weight 1,750 lbs. Can show plenty of mares in foal to him. Priced right for quick sale. **C. A. Folts, R. 1, York, York County, Nebraska.**

STALLION FOR SALE OR TRADE

Gray trotter; Standard and registered; 16¾ hands high; weight 1,250. Lots of action and style. For sale for half his value—or would trade for good big jack. If interested write for particulars. **Wm. M. Wegmann, M.D., Bladen, Webster County, Nebraska.**

THREE JACKS FOR SALE.

One registered jack; 15¾ hands. Black with white points, heavy bone, good head and ear, an extra good one. One brown jack, 14¾ hands; extra heavy bone and body. Foaled August 4, 1909. Will make an extra good mule jack. One jack 8 years old, 15½ hands. Extra good bone and body. Extra breeder, but spoilt to jennet. One jennet, 9 years old; 14½ hands. Extra heavy. **W. W. Downing, Hawk Point, Lincoln County, Nebraska.**

IMPORTED BELGIAN STALLION

For Sale—Name Barnum de Lillois, No. 26118—1605—404, Bay; black mane and tail; foaled the year 1901. Is perfectly sound and weighs 1,950 lbs. A sure foal getter. This horse will be sold very cheap if taken at once. For further information, address **Frank Wing, Cambridge, Henry County, Idaho.**

PERCHERON MARES IN FOAL

50 head to select from; nearly all black or dark grays; 25 coming 3 and 4 years old, that show to be with foal; 15 well matched pairs; 20 coming 2 and 3-year-old stallions. All the big, rugged, heavy boned, ton type. Price, breeding and individuality RIGHT.

James Loonan & Son, Waterloo, Blackhawk county, Iowa.

Imported Percheron, ton stallion, $1,000; imported mares, $450 to $550 each. Home bred, registered stallions and mares, $200 to $450.

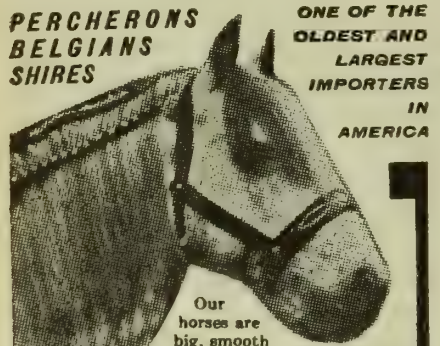
H. Redenius, Rushmore, Nobles, Co., Minnesota.

PERCHERON MARE

Will sell my registered Percheron mare Vesta 20720, sired by Contigny 18039 (35338) etc., etc. Dam Alixe 11420 (21244) by Picador II (5606), etc. Age 14 years. Safe in foal; weight 1,940 lbs., 10½ inch bone below knee: color, light gray. Address **Frank E. Greasamar, Galena, Delaware County, Ohio, R. 1.**

rock salt in her manger a month before abortion. I would be glad to know the cause of this abortion, and also a remedy.—Minnesota Subscriber.

REPLY—We are unable to reach a conclusion as to just what provoked abortion in your mare. She may have met with some accident unobserved by you. A stallion owner might be ever so careful and unintentionally permit his stallion to serve some mare that had aborted with the result that subsequently served mares might foal prematurely. There should be nothing about salt that would provoke abortion when animals are accustomed to it and have free access to it at all times. The subject of abortion will receive a full discussion in a future issue.



PAYS $4,000 FOR A STALLION.

The increased service made possible by the practice of scientific breeding, including the use of capsules, led recently to the sale of another high priced stallion that will make good. The buyer is John R. Maynes of Macedonia, Ia., who has been for many months hunting the best Shire stallion he could buy. Wm. Crownover of Hudson, Ia., who made the sale, writes us concerning it, as follows:

"Mr. Maynes came here and after looking over Surveyor and his yearling stallion colts, decided he was the horse he was hunting. Surveyor tipped the beam at 2,280 pounds and was never looking better. I had given up the idea of ever selling this horse and intended to buy more good mares to go with him, but my policy has always been to have a price on everything and I made Mr. Maynes the price of $4,000. Mr. Maynes had his nerve and money with him and closed the deal. While I was sorry to see Surveyor leave Paramount, I am glad to see him go in good hands and some good pure bred mares with him. Mr. Maynes is to be congratulated on owning what I consider the best breeding and show Shire stallion in America. I found Mr. Maynes one of the best judges of horses that ever came on my farm."

PERCHERONS BELGIANS SHIRES

ONE OF THE OLDEST AND LARGEST IMPORTERS IN AMERICA

Our horses are big, smooth flat-boned fellows, with great quality style and conformation. Will please the most critical. Prices reasonable. Satisfaction guaranteed. Letters from hundreds of satisfied customers and big illustrated catalog mailed free.

Watson, Woods Bros. & Kelly Co.

STALLIONS FOR SALE

Imported Stallions—$800 to $1,000 for your choice. Home bred stallions $250 to $650 each. References, any bank in Creston, Iowa. A Latimer Wilson, Creston, Iowa.

Better Payment of Service Fees

Interest of Community Demands That Live Stock Improvement be Encouraged by Prompt Collections. Honest Men Help Pay Bills of "Beats" Unless They Help Make "Beats" Pay.

THIS is a difficult debt for some men to collect, while it is easy for others. Some communities also are harder than others. The first thing there is in collecting service fees is to get your patrons to thoroughly understand that it requires a large outlay of money to purchase the best breeding stock, and that in order to maintain this stock the service fee must be paid at a reasonable time. About 5 per cent of the live colts are never paid for, and the other 75 per cent necessarily comes from the honorable men who wish to have the good stock remain in their vicinity.

It is a business proposition for the mare owners to help the owners of good stallions or jacks to collect the service fees. It eventually means cheaper service to them, and if the proposition is properly presented to the responsible mare owners, they will gladly give their assistance in collecting the doubtful debts. Is it fair that a majority of the men in the community pay for the colts of those who wish to evade their honest debts? The breeder must have rules to go by. All his customers must be treated alike, in order to give them the best possible service. That is all they are epecting, and they are demanding this. They can be made to realize that there is a certain amount of expense attached to the keeping of valuable sires, and that it is necessary that these good sires receive their full share of business, and that the service fees be paid. If these conditions are not met with it is not probable that a better sire will be purchased next time. They should be interested in the stallion owner making a reasonable profit, in order to encourage him to buy a better stallion or jack the next time.

It is through the use of good sires that live stock is improved. These good sires should be encouraged in every community. The public spirited individual who spends his money for them must have the support of the better element in every community, and every responsible mare owner will help the stallion owner collect his doubtful debts every time it is possible for him to do it if he understands the conditions properly. Service fees should be collected the same as any other debts, in a business like way. When they are due the bill should be presented. If the individual is not able to pay this debt at that particular time prepare a note and have it signed, with sufficient security, that it may be collected at the bank, giving him a reasonable time to meet the obligation. If an individual refuses to pay, or to sign a note, he should be sued, and a judgment rendered. A suit, however, should not be brought until all peaceable means have been tried. It is not always a good plan to make enemies, as there are a few men who are good pay but a little slow. It is the individuals who try to evade an honest debt who should be "pinched."

Nothing is more disgusting or more dishonorable than for an individual to try to beat an honest debt, and there is no more honest debt than that of a service fee, yet there are men who are very anxious to defeat this obligation. The laws are different in different states. In Utah the mare and colt are both held until the colt is eighteen months old, without filing any papers. This is the best lien law in existence. It gives everybody an opportunity to be honest. It is not necessary to force anyone to pay for a colt at a stipulated time, as the stallion owner feels secure until the colt is a year and a half old. This is the kind of law that should be enacted in every state in the Union. Several states have no laws for the collection of service fees. Arkansas has the next best law. Missouri has a good law. All that is required is to sue the party in the justice court, using the Feed Bill lien, which will take the colt, but is not binding on the mare. A mare may be bred and then shipped out of the state before the colt is foaled. The Kansas law provides that a lien must be filed with the register of deeds, giving the description of the sire and dam, date of breeding, and the amount of claim on each mare. This must be filed before the colt is foaled. The stallion registration board should make many friends and do much toward the improvement of live stock in general, by placing (as a clause in every inspection law in existence) the same law which is now in force in Utah. We wish to commend those who originated the Utah law and included that clause. Other state laws will be given later.

Occasionally a mare is bred to two or more different sires, with the intention of claiming the colt to be sired by the cheaper horse or possibly by a scrub colt of his own. If the stallion owner wishes to do so, he can bring suit and force the mare owner to prove beyond a doubt that the colt is not out of his horse, which would be very difficult for him to do. The proper thing for the owner of every good stallion and jack to do is to have his friends who own mares in different sections of the community to help him watch the doubtful customers. They can be of much service, and most of them will be glad to do it.

PERCHERON STALLIONS

One black herd stallion; 7 years old. Two 2-year-olds; weighing 1800. Four yearlings. All big boned and sound. Also a few mares.

Stetson Bros., Neponset, Bureau Co., Illinois.

WM. CROWNOVER, Hudson, Blackhawk County, Iowa.

THE LARGEST IMPORTATION OF PERCHERONS IN 1911

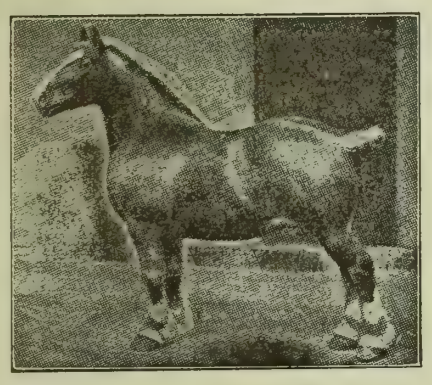
J. OMER SINGMASTER & SON

KEOTA, KEOKUK COUNTY, IOWA

127 HEAD—AUGUST 28, 1911.

These stallions with our reserve stallions will soon be in proper condition to sell, not hog fat, but in ideal breeding condition. These animals are held at reasonable prices and will soon find homes throughout the horse breeding districts. I brought over this year, with other prize winning animals, the two-year-old stallion, Jalop (85614), a gray of great promise, from Aug. Tascheau breeding barns. I have 2, 3 and 4-year-old imported stallions at live and let live prices. See them.

Write me and your letter will be answered the day it is received. My barns are in town, one block east of depot. This stock is for sale and will be sold.



Keota is in Keokuk county, 100 miles S. E. of Des Moines, on the Wash. & Knox branch of the Rock Island railway.

CLEMENT MITEAU,
Barn Manager and Salesman.

J. O. SINGMASTER & SON

IMPORTED STALLIONS

PERCHERON, BELGIAN, OR GERMAN COACH

A large selection of the above named breed of excellent quality, at reasonable prices. Every horse leaving our barn is backed by a fair and quare guarantee. Our twenty-seven years of continuous importing high-class stallions with a resident buyer in Europe enables us to meet all competition. If in the market for a stallion, write us. We can use bankable paper.

Dr. W. H. Richards

IMPORTER OF

Belgians and Percherons

A fine importation arrived Sept. 10, 1911. I have selected them personally, and have the pick of Belgium and France's 2 and 3-year-olds. All were selected for good breeding, soundness, bone and individuality. All good colors and will make ton horses. Every horse absolutely guaranteed. Any one looking for a first class STALLION at very REASONABLE price should come and see them before buying. Barns four blocks from Santa Fe depot, Emporia, Lyon Co., Kas.

IMPORTED PERCHERONS AND BELGIANS

Stallions from 3 to 4 years old. All acclimated and sure foal getters. All work single. Run in color, black, gray, sorrel and bay; good action, bone and all of first class conformation; weigh from 1,800 to 2,300, honest weight, with reliable pedigrees. All imported by us and a few are European prize winners. **We are natives of France and we know the prices are right.** We also have a few choice mares in foal. Come and see us or write

TRUMANS' PIONEER STUD FARM, BUSHNELL, ILL.

RHEA BROS.

PERCHERONS

We exhibited fourteen Percherons at the late Nebraska State Fair and won 17 prizes, as follows: One silver medal, one championship, seven firsts, two seconds, three thirds and three fourths. Now, remember that we showed our home bred horses in the same classes with the imported stallions and won First every time, bar one. So much for the show. The important thing to be considered is "how does the whole lot show up?" and that is exactly where we are strong. Our two-year-olds, some of them still in the pasture, weigh from 1,600 pounds to 1,900 pounds. These weights guaranteed.

We always claimed to have the big boned kind, and this season we are sure we have better bone than ever, cleaner joints and better feet.

Don't lose sight of how we raise these colts, in the pastures winter and summer, until coming three-year-olds. That's why they are hardy and prove breeders from the start.

Our horses are acclimated, its importance cannot be over estimated. We have stallions coming two, three, four and a few older ones for sale at prices that are very reasonable. Every stallion sold under a full guarantee; can furnish life insurance for two-thirds value at cost.

Write for pictures, descriptions, prices and any information you may want.

Arlington is on the main line of the C. & N. W.R. R.
2½ miles northwest of Omaha, 8 miles east of Fremont and 55 miles north of Lincoln.

AMONG THE BREEDERS

PUBLIC SALE DATES.

Upon request we will announce, under this head, free of charge, the date and location and the name of proprietor or manager, for all public sales of pure-bred live stock which are to be advertised in the columns of the American Breeder.

Jacks and Jennets.

Feb. 14—W. F. Schade, Cape Girardeau, Mo.
Feb. 15—Ben. M. Green, Fruitland, Mo.
Feb. 17—Dr. W. E. Cheatham, Excelsior Springs, Mo.
Feb. 26-27—G. C. Roan, La Plata, Mo.
Mar. 5—L. M. Monsees & Sons, Smithton, Mo.
Mar. 6—W. J. Finley, Higginsville, Mo.

Dorset Sheep.

Feb. 14—Geo. W. Baker, Milton, Ind.

Clydesdale Horses.

Feb. 14—Geo. W. Baker, Milton, Ind.

Shorthorn Cattle.

Feb. 24—R. E. Maupin, Pattensburg, Mo.

Poland China Hogs.

Feb. 7—Hull & Bean, Garnett, Kas.
Feb. 12—Lee Gross, Nodaway, Mo., at St. Joseph, Mo.
Feb. 26—C. S. Nevius and Geo. Wedd & Son at Chiles, Kas.

Saddle Horses.

Feb. 17—Dr. W. E. Cheatham, Excelsior Springs, Mo.
Mar. 21-22-23—James Houchin, Jefferson City, Mo.

Percheron Horses.

Mar. 7—J. W. Barnhart, Butler, Mo.
Mar. 12—Joseph M. Nolan, Paola, Kas.

Read the advertisement of David Cooper & Sons, Freeport, Kansas, of Royal Belgian imported and home-bred stallions and mares. Every horse guaranteed as represented.

Rhea Brothers, Arlington, Neb., exhibited fourteen Percherons at the late Nebraska fair and won seventeen prizes. They raise their colts in the pasture, winter and summer, which makes them hardy.

Dr. W. E. Cheatham, Excelsior Springs, Missouri, advertises at public sale 25 head of fancy saddle bred and registered saddle horses, and Mammoth jacks and jennets, February 17, 1912, at Breezy Point Stock Farm, ½ mile west of Excelsior Springs. This is all young stock and bred by Dr. Cheatham, who has been a breeder for 35 years.

Saddle and speed horses at public sale, March 21, 22 and 23, at Onward Wilkes Farm, Jas. Houchin, proprietor, Jefferson City, Missouri. Mr. Houchin guarantees his stock, and says he has some good speed horses.

Read the Poland China sale advertisement of Lee Gross, Nodaway, Missouri, and write for catalogue. The sale will be held at the Stock Yards, South St. Joseph, Missouri, February 12. You cannot afford to miss this sale if you are interested in good hogs.

The receivers sale of 60 head of Percheron, Shire, Belgian, Coach Hackney, Standard Bred, Saddle Bred Stallions and Jacks. Also 120 acres of land in Elk county, Kansas, offers an excellent opportunity to buy good draft horses. Write to Lew W. Cochran, Crawfordsville, Indiana. The court has ordered the above sold and must go within 30 days.

Good prairie hay in car lots or to suit the purchaser, is advertised by T. P. Heefern, Piqua, Kansas. Buy direct and save commission.

H. T. Hineman, Dighton, Kansas, has 25 Mammoth jacks from weanlings to eight years old, advertised in this issue. His herd is headed by the great Pharoha 2491 Champion of

We just received a letter from Watson, Woods Bros. & Kelly Co., of Lincoln, Nebraska, stating that Mr. Watson had started back to Europe for the third importation of horses this fall and winter. They report a very successful season so far, and if the demand keeps up they will be able to sell a great many more stallions this year than last, and that is saying considerable, because they were sold out last year by the middle of April.

A. J. Johnston, Springfield, Mo., is advertising for sale a big stock ranch at what looks to be about half price. It must certainly be more than worth the money. Notice full description in the advertisement and write Mr. Johnson if interested.

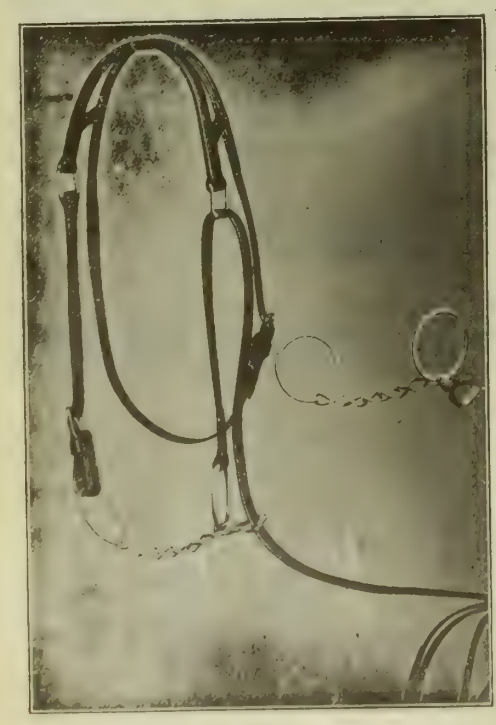
The sixth annual jack sale of W. J. Finley will be held March 6 at Mr. Finley's barns in Higginsville, Mo. Being one of Missouri's leading jack and jennet breeders, Mr. Finley is one of the leaders in this business in the United States and his sales have become national events in this line. The feature of the coming sale will be young jacks by the famous Dr. McCord, and the jennets bred to this sire of prize winners.

Read what G. C. Roan has to offer in his advertisement on page 32. Mr. Roan's annual sale of jacks and jennets will probably be the biggest of the year, occupying two days, February 26 and 27. As in former sales, Mr. Roan offers a great line of jacks and an outstanding feature also will be the 25 selected jennets, mostly bred to Barytone Mammoth, the highest priced jack ever sold at auction.

Thirty-three important public sales of jacks and jennets, marking many years of progress and improvement is the record of L. M. Monsees and Sons of Smithton, Mo. And their next public sale, to be held March 5, will be their 34th. One of the greatest offerings of jacks and jennets ever put up to the public is being held for this sale. Comment on the pre-eminence of this firm is superfluous. Everybody will want a catalog. Mention the American Breeder when writing for it.

A 6-year-old dapple gray Percheron, registered, sound, a sure breeder, and generally good is advertised for sale by W. K. Shaw of Garnett, Kas.

Notice in this issue the jacks and stallions offered for sale by Limestone Ridge Farm, Isaac Lohman, proprietor, Turney, Mo.



Percheron, English Shire, road stallions; mares and colts of all breeds, at farmers' prices, are for sale by E. P. Hamilton & Sons, Garden Grove, Iowa.

A Joint Poland China Sale.

Two of Kansas' best liked and most progressive Poland China breeders join in a sale of bred sows on February 26. The firms making this sale are C. S. Nevins of Chiles, Kas., and George Wedd & Son of Springhill, Kas. They will sell 50 head of sows and gilts that are immune from hog cholera and will be safe in pig for early fallow. As 25 of these are yearlings or tried sows, it will be a good place to buy stock capable of raising big litters. The boars to which these sows and gilts are bred belong to what is known as the large type in Poland China, a practical, prolific and all round good hog for the farmer. Address either party named above for catalog of this sale.

Johnson Automatic Stallion Bridle

Patent Applied for Nov. 10th, 1909.

Manufactured exclusively by Peter Young, Assumption, Ill.

Controls the most unruly stallion without injury and will not hurt the kindest and most docile horse. Fits the largest draft stallion or the smallest roadster without adjustment. Made of the best leather. Shipment will be made on receipt of order, as I have them in stock at all times.

Order one, and if not satisfactory, return it and your money will be cheerfully refunded. Price $5, with order. Can be sent by mail. Read these testimonials:

"Enclosed you will find check for $5 for which send one of your stallion bridles to Mr. Jacob Haning, Minier, Ill. Please send at once and oblige.

"P. S.—I have been using one of your stallion bridles for some time. Would not do without it, as you soon have perfect control of your stallion in a short time. Please send bridle to Mr. Jacob Haning at once. Send by mail. Val. Thomas, Jr., Hopedale, Ill."

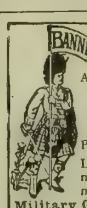
"I have used the bridle but a few days which I recently purchased from you, but must say no horseman can afford to be without it. It will hold any horse. There is no equal to it. I advise every horseman to have one. E. A. Berlin, Waterloo, Wis."

"Will say the bridle I ordered came all right. The horse that we wanted it for was one that we could not use with a chain under the jaw. Had to use rein over his neck and hard to hold back at that. The bridle surprised him very much. My son says he cannot say too much for it. De Mott & Son, Scottsbluff, Neb."

PETER YOUNG,
Assumption, Christian County, Illinois.

Imported Royal Belgian Draft Stallions and Mares.

These, together with pure-bred, home-grown horses, make up a choice collection to select from. Look ot our winnings at American Royal, 1911: First in two-year-old class; first in three-year-olds; second in aged class, showing three horses.



Also, good young jacks; jacks are ready for service. Come to our barns before buying. Stock priced to sell. Write us; your letter answered the day it is received. Breeding barns in town on two railroads.

Blue Valley Stock Farm, W. H. Bayless, Prop., Blue Mound, Linn county, Kansas.

TWO IMPORTED STALLIONS

Shire and Percheron, 6 and 7 years old. One home-bred Shire, 3 years old. All sound, high quality. **James Auld, Wakefield, Clay County, Kansas.**

Our last importation June, 1911, Prices are right, terms to suit. Write or come to see us and learn our method of doing business.

O. N. WILSON, Proprietor, - Kittanning, Penn.

Shire Horses in England

The English Drafter at Home is Judged as a Pulling Machine and Soundness is Required in All Parts With no Demand for Coach Action.

Written for the American Breeder by George E. Brown, Kane County, Ill.

M. W. Dunham wrote in one of his early catalogues, "For more than a century English breeders have shown the world the way to success." He might have said for several centuries, for as early as the fourteenth century, Englishmen turned their attention to the improvement of their domestic animals, and since then have followed it in a systematic course; the son taking up the work where his father left off. Hence, England has become the source of supply of high class stock in every line, and it goes continually to every country where like improvement is desired. Apparently there is no limit to the price paid for an animal that suits, by any one but Americans; and with some of the latter the price is the main item. This fact accounts for early importers going to the continent, or choosing low quality if they bought in England. To make up for lack of quality, a weight standard was established and if a stallion weighed a ton it was an offset for side bones, bog spavins, short wind and other hereditary defects.

A prominent English breeder once said to me, "Very few Americans seem to know the difference between meat and muscle, or between sound bone covered with meat, or a flat clean leg. If he weighs enough he passes."

The perfect success of English horse breeders is found in the fact that they breed for a special purpose; not mixing breeds as they would paints, as is done in America. Their race horse, the cab, the coacher, and the drafters are kept entirely distinct and in the show ring is kept at the gait he is used for in service. One never sees an exhibitor of a mammoth Shire attempt to show Hackney action, as at our vaudeville stock shows. Shires are everywhere known as the most rapid walkers of any of the draft breeds. That gait has been cultivated. On my Texas ranch I used imported mares and they would walk away from any others.

Absolute soundness is required in any stallion standing for service, or competing in an English show. It accounts for so many unsound Shires finding their way to America. When a stallion is rejected there, it is a common remark: "Put him aside; fatten him up. He will make a good American." They are picked up by unscrupulous buyers at $150 to $200, brought here and palmed off on inexperienced buyers as typical Shires, which in time creates a prejudice against the breed.

From my past connection with horse importing, I have advocated a law barring any but stritcly sound stallions or mares from landing in the United States, and if by chance any succeeded in passing inspection and later proved unsound, they should be castrated or destroyed.

An erroneous impression prevails in America that all Shires have a profuse growth of long coarse hair on their legs. It is true of some of the fashionable strains owned by breeders who cater to the show ring, but not true of men who breed for hard service. Shires can be had nearly as free from long hair as many Percherons and Belgians. Importers can, if they will, seek them and pay the price.

Another wrong impression is that Shires as a breed have bad feet. On the contrary, high class Shires have the best of feet. It is because bad feet are rejected there, that they can be bought at any price offered; consequently, they, with other defective animals, are dumped on inexperienced Americans.

English judges commence their inspection at the ground. "No foot, no horse," they say.

A custom that has long been followed in England is for clubs of farmers to send a competent committee to select a suitable stallion for their purpose and hire it with a groom for the season, at a fixed gross amount. It is not unusual to pay 1,000 pounds ($5,000) for a single season. If satisfactory he is re-engaged for the following season. That method has proved more successful than the "company" or "syndicate" business here. The trouble here has been that inferior stallions have been sold at exorbitant prices on the "boodle" plan.

MISSOURI HORSES AND MULES.

The census bureau says the horses and colts in Missouri in 1910 had a greater value than any other class of domestic animals, whereas cattle had the greater value in 1909. The total value of horses and colts in 1910 was $113,708,000, as against $42,095,000 in 1900, an increase of 170.1 per cent. The total number of horses and colts reported in 1910 was 1,070,913. Of these, 930,050 were classed by the census as mature horses—that is, horses born before 1909—and their value was $105,311,000, and average value $113.25. Yearling colts, which are colts born in 1909, numbered 103,424, and their average value was $65.85. Spring colts, born in 1910, were 37,439 in number, and their average value reported as $42.45. Eleven per cent of the farms of the state reported colts born up to April 15 in 1910.

The total number of mules of all ages, in the state in 1910 was 342,086, which is 31.9 per cent of the number of horses and colts. Of these, adult mules, born before 1909, numbered 265,137, and their average value was $141.90. There were 57,622 yearling colts, born in 1909, and their average value was given as $83.75. Spring colts, born in 1910, were 19,327 in number, and their average value was $47.45.

Mules and mule colts in Missouri in 1910 were valued at $43,362,000, as compared with $15,482,000 in 1900, an increase of 180.1 per cent in the decade.

STALLION DEALERS

Write me for prices on imported Percheron stallions, 3 and 4 years old that will weigh a ton. Black or gray, just imported. All guaranteed and sure foal getters. You will be pleased with my prices. **E. R. Smith, Fairfield, Jefferson County, Iowa.**

IMPORTED BELGIAN STALLION.

My coming 2-year-old Belgian stallion, **imported in dam,** 2d prize winner in National Belgian Breeders' Futurities. Color chestnut, weight 1,600 lbs. If you want a good one write for price, or better come and see him. **C. W. McDermott, Wiota, Cass Co., Ia.**

Imported Percherons and Belgians

Stallions and mares that have quality, bone, size and substance, at prices that will move them. Dont fail to see our horses before buying elsewhere, as we can save you money. Correspondence solicited. Inspection invited. **Harms & Heins, Fairbury, Livingston Co., Ill.**

PERCHERON AND TROTTING STALLIONS.

One registered Percheron, licensed, sound, steel gray, 1,800 lbs., 3 years old; an extra fine individual and a good performer.

One trotting stallion, brown, 7 years old, 2:19¼ race record, a sure 2:10 trotter has been miles in 2:12.

Both are gentle and pleasant to handle. Come and see them. **Hugh S. Maxwell, D.V.S., Salina, Saline County, Kansas.**

FIVE FINE STALLIONS

I have for sale two Percherons, 6 and 7 years; one Belgian, 8 years old; one Shire, 7 years, and a Standard and registered trotter, 10 years.

The draft horses are all imported, sound, good colors, plenty of size and bone, and all of them made after the right pattern. They run from 1,900 to 2,100 pounds.

Have been using these horses myself since they were imported. They all have fillies in their way also. Can show colts from each horse.

Will guarantee each of these horses, and price them so they will do the buyer good.

J. A. Hart, Kirklin, Clinton Co., Ind.

TWO PERCHERONS AND ONE JACK.

For Sale—One dark gray, registered, coming 3 in March; 16 hands; weight 1,450 bls. One dark chestnut, 7 years old; 16¼ hands, weight 1,800 lbs. One mammoth jack, black with white points; 6 years old; height 15¾ hands Standard measure; weight 1,100 lbs. Good and sure; plenty of colts to show. Would exchange for young draft horses or mules. Want to quit business on account of health. **G. W. Newman, Elvaston, Hancock County, Illinois.**

CLYDESDALES.

Stallions and mares, imported and our own raising from imported stock. The imported stallion Baron Kent, half brother to the $4,750 stallion Baron O'Buchclyvie. Baron Kent has weighed 2,110 and is a sure breeder; some years has averaged better than 80 per cent. The 3d prize stallion foal at last International, weighed at 5 months and 2 days, 785 lbs. Mares from weanlings up, will be priced right. Address **R. C. McMillan, Hebron, Porter Co., Ind.**

RIVERSIDE STOCK FARM.

A fine bunch of large registered Percheron stallion colts, coming 2 and 3 years old. 3-year-olds weigh 1,600 to 1,850 lbs. 2-year-olds, 1,450 to 1,550 lbs. The large boned kind. Three standard bred stallions all registered from 15¾ to 16 hands high. One black Shetland pony stud 6 years old. A fine breeder. All stock guaranteed as breeders.

A few large Mammoth black jacks.

Two carloads of mules from 3 to 4 years old, from 15 to 16 hands high. **O. L. Thisler & Sons, Chapman, Dickinson Co., Kan.** On main line U. P. R. R.

Shire Stallion

One 4-year-old high grade Shire Stallion. Sound low down, blocky, with good bone, and at a reasonable price. **W. A. Vollmer, DeWitt, Clinton County, Iowa.**

PERCHERONS

I have 30 of the best stallions that can be found today in the West. These are two, three and four-year-olds, and I am pricing them where they will sell. Write, or come and see me. **M. L. Ayers, Shenandoah, Page Co., Iowa.**

FORD STOCK FARM

Your choice of imported Percheron and Belgian stallions at $100 profit. We will sell you your choice of any stallion at $100 profit and show you their cost in plain figures. INVESTIGATE. **Ford & Harrington, Parker, Turner County, South Dakota.**

REGISTERED PERCHERON STALLIONS

Wishing to retire I have two black registered Percheron stallions 5 years old, weight about 1,600 pounds, for sale very cheap, or will trade for mares, or residence in nearby town. Must go before March 1. **Geo. B. Lane, Masonville, Delaware County, Iowa.**

THREE FRENCH DRAFT STALLIONS

Coming three years old, all black. One Percheron 3-year-old stallion. Also 4 Percheron mares, blacks and grays. **John H. Weaver, Loda, Iroquois Co., Ill.**

BLACK PERCHERON STALLIONS

Beacon No. 22448, weight 1,700. Also Ebro No. 2395, brown German Coach stallion, weight 1,500. Also good jack, quick server and good mule getter.

My barn and lots go with the business. Priced low to sell. Whole business goes for $3,000. No others in Glenwood. Good place for one that understands the impregnator. **W. E. Wickersham, Glenwood, Mills Co., Iowa.**

BREEDING STABLE CHEAP FOR CASH

Breeding stable with two large jacks, two Percherons and one Thoroughbred stallion. Did $3,000 business last year. Call or write at once, **A. L. Denbroeder, New Canton, Pike County, Ill.**

PERCHERONS AT REDUCED PRICES.

One coming three Percheron stallion, weight 1,900 lbs. Two coming two; weight 1,600 each. Two mares, weight 1,660 and 1,760. All registered in Society. Reduced prices. Address **John W. Spohr, Wellington, Sumner County, Kan.**

PERCHERON STALLION

Inspected for season of 1912. Registered, color red bay; ton horse, 6 years old; 16½ hands high, good disposition. Must sell; his stock coming on. **Young Bros., Nelson, Nuckolls County, Nebraska, R. 2.**

THREE 2-YEAR-OLD PERCHERONS

Stallions; two grays, one black. A veterinary certificate and state license with each horse. Splendid individuals and priced reasonable. **Wright Bros., Mt. Pleasant, Henry Co., Iowa.**

FOUR STALLIONS—FOUR JACKS.

All of these are registered. We have been standing them for several seasons and they have proven themselves good breeders. Investigate at once. **J. A. Eversmeyer & Son, Troy, Lincoln Co., Missouri.**

STALLIONS AND MARES.

French Draft, All Blacks.

Consisting of 4 stallions, ranging in age from weanlings to 6 years old. All blacks; all sound, and well matured, near a ton.

Also have a nice pair of black mares 3 and 4 years old, in foal. Also one black 6-year-old mare. This stock is of my own breeding. Is all recorded and priced to sell at farmers' prices. Come and see them. **Ben Martin, Garden City, Cass Co., Mo.**

PERCHERON FOR SALE.

A grandson of Old Brilliant; grand dam, the largest imported mare in Michigan, viz.: Berrien 40210, dapple gray, 8 years old. Close coupled, short jointed, heavy loin, flat bone, sound "low and wide," kind dispositioned, perfect handler; always has run in large paddock, colts very fast walkers, weight about 1,800 lbs.; fat, a ton. Sold because many colts in this section. Price, $1,000. Would consider aged registered mares if in foal, in part payment. **R. M. Sherwood, Watervliet, Berrien County Mich.**

Percheron Stallions and Holstein Bulls

A number of young Percheron stallions, size, quality and breeding. Also Holstein Friesian Bulls. Price right, inspection invited. **H. N. Holdeman, Meade, Meade County, Kan.**

CLYDESDALES

Registered Clydesdale Horses and mares; some of them closely related to the famous "Baron of Buchlyvie," who sold in Scotland recently for $47,500. For further information apply to **John Sparrowhawk, Wakefield, Clay Co., Kan.**

IMPORTED AND HOME BRED PERCHERON AND BELGIAN

Stallions; reasonable prices. Nothing but the best. **Lew. Jones, R. 1, Alma, Wabaunsee County, Kansas.** Barn at Wamego, Kansas. On U. P. R. R.

As to Capsule Breeding

Extracts From the Letters of Many Practical Breeders Whose Experience Proves the Soundness of This Improved Method of Breeding.

In the last issue breeders were requested to give their experience with the capsule system of horse breeding. This paper was the first publication to advocate and explain the advantages of the modern methods of capsule breeding. There are now about four thousand up-to-date horse breeders in the United States using this system. The old plan of artificial impregnation was to use a breeder's bag on the stallion or jack, but this is not necessary with the modern instruments. The stallion serves a mare, after which the semen is extracted from the vagina or uterus with the Carlson Semen Extractor. After the semen is obtained it is then divided into capsules so that a large number of mares may be bred at one service. A great many breeders have bred from ten to fifteen mares at a single service of the stallion. The advantages are that a stallion is not required to make so many services, and therefore, discharges strong spermatozoa, causing the colts to be stronger and better. This will eventually reduce the service fee to the mare owners. The capsule system is much surer than the natural service, when properly used. Below are a few extracts from letters received concerning the capsule system. Others will be printed in later issues. The signed statements follow:

"My success with the capsule system of breeding has been very satisfactory. Have settled mares with the capsule system that were bred at the same time that the other mares were bred by natural service, and those securing natural service had to be returned and re-served. I do more capsule breeding than natural. W. H. Baker, Lyons, Ind."

"I think I had very good success with the capsule system, as far as I have learned. I bred four mares for one man, one natural service and the others with capsules. Three got in foal. The one bred with natural service missed. I have not learned what per cent of my capsule mares did get in foal but I am sure that some of them did get in foal that would not get in foal by the natural service. N. J. Robnett, Kinmundy, Ill."

"I have had good success with capsule breeding. Found that I could breed a great many more than by the old way, and also have as good or better success breeding when not in heat. Got over ninety per cent in foal, but was very particular not to breed anything out of condition. John F. Ratliff, Carpenter, S. D.

"As to the capsule system of settling mares, I think it all right, and a man cannot afford to get along without it if he is in the horse breeding business. J. R. Maynes, Macedonia, Iowa."

"Have settled more mares by capsule than by natural service, also we have quite a bunch of jennets, most of which were settled by capsule easier than by natural service. Some of the mares I bred were bred for the first time last spring and could be bred no other way. I am sure it is a success if care is used regarding cleanliness. S. M. Orear, Parsons, Kansas."

"Yes, I think the capsule system a success. Have been settling mares that were never settled before. I would not think of handling stock without this system. L. Peltier, Wakenda, Missouri."

"I think capsule breeding is a success. I have used capsules only one season, and I am going to get pay for a good many capsule colts. The capsules are the greatest thing in the world for shy breeders. I settled some mares that I failed two seasons on with the natural service. I do not think any breeder, great or small, can afford not to take a course in the Scientific Breeding School. I. W. Yancy, Davidson, Okla."

"I have attended a term of the breeding school and will say the knowledge gained there has been of great value to me in my breeding operations. I most earnestly recommend the school to every one actively engaged in the breeding business. The capsule system is no longer an experiment, but a well established fact. To all those who are skeptical I would say, go to the Scientific Breeding School, and be shown. C. Satorins, Wynot, Nebraska."

"The capsule method is a success without a doubt, as I have increased the per cent of foals from 20 to 25 on the same horses. Have been talking with many of my patrons, and the prospects for 1912 look better than any year before. W. D. Berkley, Iowa City, Iowa."

"It would pay a large per cent of the mare owners to attend one term of the Graham Scientific Breeding School. I have been there twice, and have got more good out of it than anything I could attend. I have several mares showing with foal by the capsule system, several that the natural service would not settle. Everett Hall, Kincaid, Kansas."

"I have had very good success with the capsule system. One thing I am sure of, and that is I have not hurt my young stallion in trying to take care of the business. My per cent has been fairly good. It would have been better, if I had turned away a good many mares that I knew would not get in foal when I bred them, but the owners didn't understand why their mares wouldn't get in foal, so I just bred them. There is one thing that I have 'showed' the farmers around here, and that is that the capsule system is more sure to get the mare in foal, also that the colts are as good, if not better, than when we use the natural service. C. H. Banchart, Urbana, Indiana."

"The eight days I spent in the breeding school last February was the best investment I ever made, for with the same horse, I bred 225, and with 185 proven in foal now, and the year before I bred the horse to 108 and got 68 in foal with the natural service. With four horses and two jacks I bred 825 mares, with capsules, inpregnator and natural service, and I figure getting four-fifths. I just breed a horse once a day and breed from three to five mares at that service. The most I ever bred at one time was nine, and seven out of the nine proved safe. The most I ever bred at a jack service was three, and I prefer capsule breeding and think it is surer than with the natural service, at least it has proven that way to me, for mares that I have been trying to breed for three years with a horse, I got in foal this year with the capsule system the first time. I would advise every man that has a horse or jack to attend this school. They will find where they have been in the dark, and things will be so much easier, and you can see where you made blunders with your stallion, and know how to save him and protect him from disease. Lew Jones, Alma, Kansas."

"In regard to breeding mares with the capsule system, will say that I am having the best of results. I have been breeding with capsules since 1902, but since I attended the Graham Scientific Breeding School, and got the extractor, I would not breed any other way. I bred 89 mares to my jack last year, and from all accounts never had better results. If I had no horse or jack, I would go a long way to a man that breeds with capsules. Hays Bealmear, Dodge City, Kansas."

"I have attended the Scientific Breeding School the second time and think it a wonderful educator, for anyone who has stallions and jacks. The capsule system alone is worth many hundreds of dollars to me, and to know how to detect diseases in barren mares. I cannot recommend the school too highly. Every breeder should attend the school. He could not spend his time and money more profitably. J. W. Fender, Lone Wolf, Oklahoma."

"No man in the breeding business can afford to stay away from the Scientific Breeding School. As our mares run on the range a good deal many of them are not gentle enough to breed scientifically, yet we have some fine capsule mule colts, and are getting 25 per cent more colts than we did before attending the school. There is no question about the capsule system being a success. Arnold & Upham, Hermosa, S. Dak."

"I think the Scientific Breeding School is the greatest thing to any stallion or jack owner also to mare owners. I could not do half the business without it. I have attended three terms, and have been paid many times for my time and money. I think the capsule system is the greatest thing ever discovered for the improvement of good horses and mules. I cannot say enough for the good it is doing for the country. N. S. Cox & Sons, Pattonsburg, Mo."

"I have taken one term at the Scientic Breeding School,, and will say that the capsule system is a success. I would recommend anyone who is a stallion or mare owner to go to this school. I would not take anyways near what I was out for what I learned while there. E. A. Wallace, Dallas City, Ill. (Elder Grove Stock Farm).

"I have had extra good luck with the capsule system. I used most all 9-day mares for natural, and all the rest for capsules, so any horse man can see the advantage I gave to the natural service, and I will have more capsule than natural service colts this spring. F. J. Goodrich, Scottsville, Kansas."

"I have had good success with the business which is taught at the school. Think it will pay any man to attend. W. H. Williams, Latham, Illinois."

"I am much pleased with the capsule system, and would not attempt to keep stallions without using it. I am sure it is the most successful way to get shy breeders in foal and also put many barren mares to breeding. No stallion owner can afford to not use this system. G. B. Heatha, Indianola, Iowa."

"I have the best of success with the capsule system. It will double my profit this season. We have some capsule colts and they are all right. The mare owners are seeing the benefit and are going to breed that way this season. I am selling all my small jacks, and will keep nothing but first class jacks and stallions, as one of each will do the work of three or four the old way. By having better stock, will get better colts. J. B. Coates, Prue, Okla."

"As to the Scientific Breeding School, I think it a success, and for my work it was very successful. Our people were very much against artificial breeding and they even went so far as to threaten me with the law. I said go ahead, but they did not. I used the capsules on several mares that had been barren from two to three years, and the most of them are showing safe. J. E. Gibson, Morehead, Kansas."

"I have only used the capsule system very little, but with good results. I am sure it is all right if properly used. I think every owner of a stallion or jack should attend at least one term of the Graham Scientific Breeding School. E. R. Thomas, Bye, Colo."

"Will say that I have had good results in aritficial breeding. Am giving the school a boost every chance I get, for I know every one gets his money's worth who attends the Graham Scientific Breeding School. W. A. Wells, Oak Hill, Kansas."'

"I have spent a good deal of this cold weather trying to find out the best I can, how my mares are coming, and I am more than pleased with what I find. Have settled several mares that never had colts, that were given up by their owners, not to breed. Two mares bred out of heat, and the owner says they have not been in heat but one time since bred. E. Springer, Oakland, Indiana."

"I have had good success, and have got enough mares in foal that had never been able to get in foal, to pay me for my term at the school. Wm. Johnson, Flandrean, South Dakota."

"In regard to my mares that were bred with the capsule system. They are showing up better than those bred by the natural service. The capsule way is the only safe way to breed mares with success. No man that owns a stallion or jack can afford to miss the Scientific Breeding School, no matter what the cost. Money cannot buy what I got out of the school on the disease of mares. I refused to breed several on that account. V. O. Cudd, Rector, Arkansas."

"Will say that the capsule system is all right. I have had good results, and think all the mares that I bred are with foal. As to the school, will say that I think every farmer that raises stock ought to attend the school, as well as the jack and stallion man. J. W. Wertz, Fairland, Oklahoma."

"I find the capsule breeding as good or better than the natural service, and there is no difference in controlling the sex. The capsule system can be relied upon the same in this as in the natural service. A. E. Meiner, 714 South Main Street, Hobart, Oklahoma."

"There is many a slip, but the capsule system is far better than the old way, though it takes painstaking work. I have had as good results from the capsules as from natural service, and more satisfactory to myself and to many of my patrons. Charlie Bull, Cimarron, Kansas."

"I have used the capsule system and think it is the best way to settle mares, and especially those that are hard to settle. I know from experience that anyone using the capsules will get a better per cent of foals. A. M. Goodheart, Lucas, Kansas."

"I think the Graham Scientific School and the capsule system are a booming success. Owing to sickness, I have not been out to see just what my success with the capsules is, but my patrons report a large per cent in foal. Wm. M. Anderson, Disco, Illinois."

"Without the capsule system I would quit the business. I know it is a success, as before I begun using the capsules I settled about 40 per cent of my mares, and now 75 per cent. 'GOOD' for the Scientific Breeding School and the American Breeder. N. A. Davis, Pittsburg, Texas."

"The capsule system is a success, and every stallion or jack owner should attend the Scientific Breeding School, if he wants to make the most out of

(Continued on page 29).

Breeding Appliances of All Kinds

Bending the Soft Metallic Point of the Carlson Semen Extractor After B eing Inserted in the Uterus (Womb). The Neck of the Womb Will Bend to Meet These Conditions Without Injury.

The Carlson Semen Extractor and Capsule Syringe

Which can be used as an Impregnator or for getting the fluid out of the vagina or uterus for filling capsules. This is the only way to use capsules successfully as 60 per cent of the services inject the semen into the uterus where it cannot be obtained otherwise. The syringe holds 8 ounces of fluid. This instrument is being used successfully by thousands of breeders. It is made of the best metal and can be taken apart easily and boiled, which is the only way breeding instruments can be properly sterilized. As shown in the illustration above, it has a soft metallic point at the end, which can be bent in any direction after it is inserted into the uterus. This is the only instrument that can be used for getting the semen out of the uterus. All necessary directions telling how other breeders are using the Extractor sent with each order.

Price $5.00 For a Limited Time.

Curved Metal Impregnator

This instrument is sold by other dealers for from $5 to $6. It is nickle plated, about 22 inches long, with a glass tube in it. Price $4.00.

Microscopes

For use in testing the semen of stallions or jacks. Made especially for this purpose. Magnifies 500 times and is used by veterinarians and physicians. Price $35. Boxed in fine case. These instruments are of great value in the breeding business. Through them you can see for yourself and show your mare owner the live spermatozoa of your sire.

Thermometer

Tested and used for keeping water at the right temperature.

Price 75 Cents.

POINTED Breeding Capsules

We have the only capsules made especially for horse breeding. Some capsules do not dissolve, leaving a foreign substance in the uterus which will prevent conception. Other capsules are too flimsy to use for this purpose. You cannot make any mistake by buying capsules from us as we only have one kind. We have them boxed with 100 in each box. The box is tight so they will be clean. These capsules are properly baked and all bacteria killed before they are mailed. Always keep the lid on the box when not in use. Price per box (100) $1.50

Directions for Ordering

Send money orders or draft as exchange is always charged on personal checks. Always name your express office as well as your post office address in order to insure prompt delivery.

Bulb Impregnator

This is the best bulb impregnator on the market. Some dealers sell for $5 and $6. Price $2.

Breeders' Bags

Three sizes, small, medium and large. Stallions weighing 1,200 to 1,600 pounds usually require a medium size. These bags are guaranteed not to tear from any cause before March 1, 1913. If they do tear before that time return the top part with our stamp on it and 35 cents in cash and we will send you a new bag. Price, Each, $1.00.

Speculum

Made of good material, nickle plated, easily inserted, will last a life-time.

Price $3.00.

Emasculator

This emasculator (improved style) is made by the Kny Scheerer Co., and bears their trade mark. It is guaranteed to give satisfaction. If it breaks within one year or gets out of order, return it and get a new one. This instrument is made of the very best steel. It is the latest method, only having three pieces and can be taken apart very easily and thoroughly sterilized. It operates perfectly. Price, $7.00.

Veterinary Thermometers

This thermometer is recognized and used by the leading veterinarians for taking the temperature of animals. It has a metal case which insures it against breaking and will last a life-time. It has a small chain with pin in it that may be fastened to the vest pocket and carried with safety. Price, $1.25.

POSTAGE AND EXPRESS PAID ON ALL ORDERS.

Our Harness Horse Talk

Suggesting the Kind of a Showing a Speed Sire Has to Make if He is to Hold Prestige Nowadays. The Few That Can Put 'Em Under 2:10.

Written for the American Breeder by Henry Ten Eyck White.

DURING the season just closed eighteen stallions have placed to their credit, ten or more new standard performers at the trot or the pace, while 64 sires are represented by five or more each.

It is not so long ago that a sire having ten or more of his get enter "the list" in one season would on account of that fact take very high rank among his kind, but the breeding of trotters has made such wonderful strides in the last half decade and such numbers of two year old trotters now are stepping miles better than 2:30 every summer that what would have been an extra creditable showing five years ago is today rather common. Taking ten new performers in 1911 as the standard, and we have the following stallions eligible to the list given herewith, the total number of standard performers by each to the close of 1911 being also given.

Name.	Sire.	New Perfs	Total Perfs.
Moko	Baron Wilkes	19	80
Allerton	Jay Bird	18	235
Peter the Great	Pilot Medium	18	81
Mobel	Moko	17	36
Bingen	May King	16	113
McKinney	Alcyone	13	150
Walnut Hall	Conductor	13	26
Ashland Wilkes	Red Wilkes	11	165
Bellini	Artillery	11	69
Direct Hal (p)	Direct (p)	11	38
Ed Custer	Baronmore	11	31
Jay McGregor	Jayhawker	11	35
Red Medium	Red Wilkes	11	48
Todd	Bingen	11	67
Cochato	Bingen	10	16
Hal B. (p)	Hal Dillard (p)	10	33
Klatawah (p)	Steinway	10	29
The Exponent	Bingen	10	10

That is the view from one angle. But there are several others from which observation should be made before a comprehensive survey of the situation can be had. For instance, let us take the above list. Confine it strictly to trotters, the pacer not being the sort of horse the breeder, speaking generally, is after, and then see how many 2:20 and 2:10 nags are to be found in the "standard" speed output of each stallion. Here is the result, many which figure above being missing.

Name.	2:20	2:10
Bingen	4	0
Walnut Hall	4	0
Bellini	3	1
Moko	3	0
McKinney	3	0
Allerton	2	0
Peter the Great	1	1
Ashland Wilkes	1	0
Jay McGregor	1	0
Red Medium	1	0
Todd	1	0

Quite a change. Of the 18 horses in the original list seven drop out under the new standard, the three pacers, Direct Hal, Hal B., and Klatawah, siring nothing in 2:20 or better but pacers, while The Exponent, Ed Custer and Cochato have their youth to blame for their elimination. On the 2:10 basis among new 1911 performers only two series qulaify. Bellini (dead) and Peter the Great, and their fastest representatives were 3 year olds, Atlantic Express, 2:08¼, and Peter Thompson, 2:07½. All of which goes to show how really hard it is for any stallion to get a genuine 2:10 or better racehorse trotter, and the especial difficulty of having one reach the 2:10 mark its first season out.

The Bingen family leads in the above tabulations, the head of the family, two of his sons, Todd and The Exponent, and one grandson, Cochato, appearing in the first list, while Bingen and Todd have a place in the second one. The only other sire having two places in either list is Moko, which is assisted by his son, Mobel, in the first one. Bingen and Moko are the same age, 18, which is an important factor in the problem, and each has had a first class chance in the stud, the advantage, if there is any, being on the side of Moko, which got more foals before he was five years old than did Bingen in the same period Bingen descends in the male line from Electioneer through May King, son of Electioneer, while Moko is a grandson of George Wilkes, his sire being Baron Wilkes, 2:18, one of the best sons of the old horse, and easily his most conspicuous as a progenitor of colt trotters. But Bingen gets two fine crosses of Wilkes blood in the female line of his pedigree, his dam being by Young Jim and his grandam by Red Wilkes, both sons of George Wilkes, while Moko has no Electioneer strain, his dam being by Strathmore; grandam by Volunteer. There's a cameo representation of each pedigree, from which each man may argue as he listeth.

A few years ago Moko was in a class by himself as a sire of futurity winners, but Peter the Great now holds that position. But no son of Peter the Great has sired a 2:20, or even a 2:25 tortter, much less a 3-year-old capable of a mile in 2:10, which is where a stake nag of that age must step if he is to get any of the money in the big events for youngsters. s he is but two years younger than Bingen and Moko and his first generation product of speed is surpassingly brilliant, this fact is attracting attention, especially when Bingen, with Todd, foaled 12 years ago (dead), has a son like Bingara, now 10, in the field, which had six trotters racing to records better than 2:20 in 1911, two of them, Belvasia and Binvolo, taking race records of 2:06¼, 2:07¾, respectively, while Binvolo's first foal, Benzoni, a 2-year-old, took a record of 2:25¾. Daughters of Bingara have produced two 2-year-old 2:30 or better trotters, all of which is a record for a 10-year-old sire. Two daughters of Peter the Great have produced 2:30 trotters, which goes to strengthen the belief that his family is a female line one, just as that of Nutwood proved in the final accounting to be, although at one time he was the champion sire of standard performers.

Another very interesting way of examining the quality as well as the quantity of the new 2:30 trotting, or 2:25 pacing list is to take all the sires with a reasonably large number of accessions to their previous showing and also show their previous work. This is done in the subjoined list, it dealing with trotters only, as, if pacers are counted without stating how many each stallion sired, the rest of the tabulation is of no value. Only sires with eight or more new 2:30 trotters in 1911 are admitted to this list, and as the age of each is given a new test which brings out some very interesting and important facts is imposed. The age of each horse precedes his name, and in order that the old fellows shall be given a fair show I have added a column showing how many 2:10 or better trotters each member of the list has sired. Of course

PUBLIC SALE
25 Head

Of fancy Saddle bred and Registered Saddle Horses, and Mammoth Jacks and Jennets,

FEBRUARY 17, 1912

1-2 mile west of city limits, Excelsior Springs, Missouri, at

Breezy Point Stock Farm

Three coming 4-year-old jacks in sale. Blacks, light points, near 16 hands. I don't think the world can beat them. Also two 5-year-olds that are good, and one yearling colt, extra. If you want to get blood that produces the largest mules in the world here is your opportunity—from demonstrated facts I make the assertion. I owned King Mammoth, the sire of Missouri Queen, weight 2200 pounds, the largest mule on record. King Mammoth also sired a jack that at 2 years old sold for $2,000, Giant King. This jack sired a mule that a 2 years old sold for $300, and at maturity will be as large as Missouri Queen. Four jacks in sale by this young jack. Horse and stallion colts. One 5 years old, good as the best. Two mare colts, extra. Also one yearling, one 3 years old, three brood mares. All black except one by the gerat Rex Donnell 2042. Other noted sirss. Jennets, two of them are great jack producers. One extra good 2-year-old. One colt. Thirty-five years a breeder, and I raised them to sell. All of young stock bred by me.

Dr. W. E. Cheatham,

Excelsior Springs, Clay County, Mo.

Saddle and Speed Horses

AT

PUBLIC SALE

March 21, 22, 23

Saddle horses that can win in any company. Business saddle horses. Lady broke saddle horses. Ten head of young saddle stallions. Some registered saddle brood mares. Speed horses good enough to win on the grand circuit. These horses are right, not "has-beens." Ten head of good breeding jacks, also in the sale. I make my statements good. If interested, write me.

ONWARD WILKES FARM, JAS. HOUCHIN, Proprietor.

Jefferson City, Cole County, Mo.

RECEIVER'S SALE

60 Percheron, Shire, Belgian, Coach, Hackney, Standard Bred, Saddle Bred, Stallions and Jacks.

This is a choice lot of stallions, 2 to 6 years old, a fine lot of sound jacks, 3 to 8 years old, 14 to 16 hands.

120 acres of land in Elk county, Kansas; improvements, house and barn. 80 acres in Randolph county, Indiana; improvements, house and barn.

The court has ordered the above sold and everything must be sold inside of 30 days for the low dollar. If you want a first class stallion for less than half value now is your chance, as they must sell at once.

Lew W. Cochran, Receiver, Crawfordsville, Mongomery County, Indiana.

REGISTERED SADDLERS.

We have 8 stallions and 12 mares and fillies **for sale.** Correspondence solicited from parties who mean business. **G. W. Davis, Mt. Carmel, Fleming Co., Kentucky.**

SADDLERS FOR SALE.

We offer at private sale a fine lot of stallions, mares, geldings, colts and fillies. For catalog address, **John T. Woodford, Mt. Sterling, Montgomery County, Kentucky.**

their youth prevents such wonderful young sires as Gen. Watts, The Exponent and Ed Custer from having 2:10 per formers, but likewise it brings out in strong relief the fact that Bingara, who is but two years older than Custer, and three years older than Gen. Watts and The Exponent, has two members of the 2:10 trotting list to his credit in Bolvasia, 2:06¼, and Binvola, 2:07¾. Now Bingara, foaled in 1901, had a crack 2-year-old trotter in 1907, Binvola, 2:15¼, at that age, and winner of the best three-heat race for 2-year-olds. None of our more recent young sires have had, to my recollection, a 2:15¼ race record 2-year-old on the turf when the sire was himself but a 6-year-old. At seven years of age Bingara was credited with a 2:09* 3-year-old trotter, and at 10 he has a total of 33 trotters in the 2:30 list. He still is the big live wire of the Bingen family, a wonderful distinction in itself, and one not to be overlooked. Here is the table:

Name	New	2:10	Total
7—Gen Watts	9	0	9
7—The Exponent	9	0	9
8—Ed Custer	9	0	16
10—Bingara	9	2	33
12—Todd	11	9	60
13—Walnut Hall	12	2	24
13—Jay McGregor	9	1	28
14—Red Medium	8	2	37
14—Mobel	13	0	24
16—Peter the Great	16	12	78
18—Bingen	12	7	125
18—Moko	18	3	71
23—Bellini	10	9	62
24—McKinney	12	13	123
25—Allerton	12	6	144
25—Prodigal	8	3	115

I never before have seen the respective standing of prominent stallions figured this way, but the method appeals to me as being about as equitable a plan as could be devised, and it certainly gets a lot of valuable information that does not appear on the surface of things into a small space and presents it clearly. Young and old sires alike are, by this method, handed exactly what is coming to them in the way of credit for speed production, both in volume and in quality, and that is what every man who is interested in horses wants to know.

On the whole (but only in the first generation), the blood of Peter the Great makes the best showing. Although 9 years younger than McKinney he comes within one of tieing that horse for first place as a sire of 2:10 trotters. But it should be remembered that six of Peter the Great's 2:10 trotters are four years old or under, three of them 3-year-olds, while there is not a single one of McKinney's lot as young as four. The fastest by Peter the Great is Grace, 2:05* at four. The fastest by McKinney, and the only one to beat 2:06, is Sweet Marie, 2:02, and she was 10 when her record was made. Sadie Mac, 2:06¼, never beaten until the race she died in, was then five. Czarevna, 2:07½ at theer, in a race, was retired as a brood mare the next spring, so Grace, 2:05½, at four, is the eldest of the Peter family that looks to have a chance to get to the 2:02 mark, with Peter Thompson, now three, next in line.

It is a fascinating and instructive thing, this comparison of the great trotting tribes.

A MORGAN TO MASSACHUSETTS.

To the American Breeder—At the request of the Massachusetts Agricultural College at Amherst, the Bureau of Animal Industry of the United States Department of Agriculture loaned that institution the Morgan stallion Red Oak (5349) for the season of 1911. This is the first stallion to be sent out by the bureau from any of its breeding stations. Heretofore the mares have been sent—in some instances long distances, to the bureau's Morgan Horse Farm at Middlebury, Vermont. There are a number of good Morgan mares in the vicinity of the college which will be bred this season.

Red Oak is a bay stallion, with a star, hind ankles white, five years old, stands 15.1 hands, and weighs 1,000 pounds in breeding condition. He is a horse of excellent Morgan conformation and all-round action. His sire is General Gates; dam, Marguerite by White River Morgan (482); second dam by Crooker Horse (1337); third dam by Churchill Horse (1071). He has been in service at the Morgan Horse Farm of the bureau for two seasons and has shown himself to be a very good sire. With the opportunities he will have at Amherst he should be quite useful to the farmers of the Connecticut Valley.—James E. Downing, Washington, D. C.

Washington officials announce that the racing of American-bred horses in Canada or Europe will not be affected by the customs court's ruling which imposes a duty on all domestic animals when they are returned to this country. Horses which go to Canadian tracks or to France or England will be classed as animals for exhibition and may be readmitted free of duty. The ruling has also been modified regarding the taking of horses into Canada from this country in the course of business intercourse between the two countries, so that no duty need be paid on such horses if returned to this country within a reasonable time.

AS TO CAPSULE BREEDING.

(Continued from page 26).

his business. W. J. Strong, Moran, Kansas."

"Last season's work with the capsule system convinced me that it is all it is claimed to be. Since attending the Graham Scientific Breeding School I am fully prepared to make it a success. Sooner than go back to the old way of breeding, I'd quit the business. It would be to the interest of all mare owners if every stallion owner were compelled to attend the school. It would teach him, beside man yother useful facts, the danger of having healthy mares infected with disease germs under the old way of breeding. Chris W. Weiterer, Prairie View, Arkansas."

"I consider the capsule system of breeding mares a success beyond a doubt, and no longer an experiment. In my two years' practice of this system I have succeeded in settling a number of mares from the same service; mares, too, that previously been barren, some caused from malformation of the uterus preventing conception from natural service. No wide-awake breeder can afford to longer remain ignorant of this system, which contributes so largely to his success. A little time and money spent in acquiring a knowledge of the course, would prove an investment worth while. A good number of my patrons are now requesting this system in preference to the natural service. J. H. Motley, New Hardford, Mo."

"I have had good results with the capsule system of breeding, that is to say I practiced it for the first time last season, and have a good per cent of the mares showing up O. K. I talk scientific horse breeding to my customers, to my competitors and to everybody. I am much pleased with what I learned at the Graham Scientific Breeding School. A. P. Wicklein, Evansville, Illinois."

"I could say much about my success of 1911, as I have made two stands in two different places. I have two mares that cannot be gotten in foal only by the capsule method. No

STALLION SERVICE RECORD BOOK

Every Stallion or Jack owner Should have this record book, because it is accurate. It is a handy pocket size, with a Waterproof cover, printed on best of paper.

It has a calendar, also a gestation table. It has an index of ten pages, so that each mare can be found easily It has room to give a complete record of each mare. 100 mares can be recorded, each mare having a whole page. The blank at the bottom of each mare's page, when properly filled out and signed gives you a promissory note that is legal and binding.

If you ever use one of these records you will want more of them, just as thousands of others are doing. It has no worthless advertisements in it. It is the latest Stallion Record Book on the market. If you are not satisfied with it, return it, and get your money, which will be cheerfully and promptly returned to you.

PRICE; 50c EACH OR 6 BOOKS FOR $2.00, POSTAGE PREPAID

Two Flashy Stallions

Two stallions, ¾ Arabian, ¼ Standard, 9 and 10 years old; weight 1,200 and 1,250 lbs. Strawberry roans with white mane and tail. Full brothers, well broke, gentle, fine style and action. Have proved themselves good and sure breeders. Can show lots of colts of either. Will sell cheap if taken at once. **H. Heckmann, Jerico Springs, Cedar County, Mo., R. 1.**

FOR SALE OR EXCHANGE

One black jack with white points, registered in Standard Jack and Jennet Registry of America. Can show plenty of colts also mares in foal by above jack. Would trade for American bred Percheron horse. Have two jacks; need only one. **John W. Wormer, Center Point, Linn County, Iowa.**

SIX STANDARD BRED STALLIONS

Some of them over 16 hands and weight 1,300 pounds, with great style, speed and action. Also a few standard mares and fillies. Prices right. Write for prices and description. **Coleman Stock Farm, Creve Coeur, Saint Louis County, Mo.**

Saddlers For Sale

At private contract, I offer for sale the most fashionable strains and superb individuals in stallions and mares and fillies, by such sires as Rex McDonald 833; Rex Monroe 2063; Star McDonald 2526, and Fos McDonald 3096. All bred and developed by me. **H. A. Greenwell, Lakenan, Monroe County, Missouri.**

SADDLERS FOR SALE.

At private contract, I offer for sale the most fashionable strains and superb individuals in stallions and mares and fillies, by such sires as Rex McDonald 833; Rex Monroe 2063; Star McDonald 2526, and Fos McDonald 3096. All bred and developed by me. **H. A. Greenwell, Lakenan, Monroe County, Missouri.**

breeder of ordinary business can afford to stay away from the school. I have a large per cent of foals coming in the spring. J. M. Justice, Stilwell, Kansas."

"As far as I can tell I have had good results with my capsule breeding. I settled a larger per cent than I did with the natural service. I am well pleased with the results of my first years' work, and feel repaid many times for my schooling. Geo. Wm. Briles, Hanover, Kansas."

"I think the capsule system all right if rightly managed. S. S. Rowe, Rusk, Kansas."

"I wish to say that the capsule system is unquestionably a success. I find it easier to settle all classes of mares. It makes it easier on the stallions, also it makes it convenient for my patrons. I want to attend the school again. J. P. Taylor, Foley, Missouri."

"I attended the August term of the Scientific Breeding School, and did not make a fall season with my colt. Only bred two mares with the capsule system and settled them both the first time, and had no trouble in getting the semen from the mare. I surely think it is all right. F. H. Moorman, Solomon, Kansas."

"I got as many mares settled by the capsule system as by the natural service, and some that I could not get with the natural service. H. L. Van Orman, Forman, N. Dak."

"I have had very good luck with the capsule method of breeding. Find mares with capsules that never brought colts before. The school is all you claim, and every man that owns a stallion or jack is standing in his own light if he dont attend. T. Wallrider, Conway, Ark."

"Am more than pleased with the success obtained by attending the scientific breeding school. Will say that I have settled mares that have been served by every stallion and jack in reach, with the knowledge I received at your school, some by artificial breeding, and others by remedies which the instructor gave. I am sure a man in the breeding business cannot afford to miss this most valuable school, as it teaches you how to detect unprofitable and diseased mares. This is the most vital point in the breeding business. I am the only man in this locality that has taken a course in the breeding school, and the result is I am getting all the hard stickers, and I have opened some of their eyes at the wonderful work that can be done by understanding the up-to-date methods of breeding. J. A. Croft, Neola, Iowa."

"Owing to limited business it has never been necessary to do capsule breeding, but I can assure all, from my own knowledge and observation, that not only the principle is right but it is eminently successful as a number of farmers of this locality can testify, and almost an unlimited number of "capsule colts" can be pointed to hereabouts, and breeders rarely object to this form of service now, except a few that have failed to get results, and the same ones generally fail to get results, also, from natural service.—Owen L. Fitch, Barry, Ill."

"I have had good success in breeding from capsules. My only trouble is that the most mares I have bred with capsules have been old skates. that will not get in foal at all. I rarely fail with a young or regular breeder. It is the only way to breed jennets.—G. B. Weaver, Harrisonville, Mo., R. R."

"In regard to the capsule as the scientific plan I think it is all right. I have had good luck. Used 100 capsule—mostly on mares that were not sure breeders and not right, and have got sure as much as half on that class of mares.—J. L. Sappington, Centralia, Mo."

"I had splendid results with the

I HAVE FIVE JACKS
I want to sell. Four blacks, Mammoth bred, and one gray. One yearling, two 2 years old; one 4 years old and one 5 years old. **J. H. Hock, Buckner, Jackson County, Mo.**

Real Estate For Jack

I want a good black or blue Mammoth jack, and will trade town property in Butler, Okla., for it.
T. P. Scott, Butler, Okla.

JENNET SPOILED BLACK JACK.
Weight 900, sound, 8 years old. Sure foal getter, but has run with my jennets. Price $250, or will trade for registered draft or saddle horse, not over 8 years old. Also 3 and 4-year-old jennets in foal, price $100 each. **E. R. Smith, Fairfield, Jefferson Co., Iowa.**

JACK WANTED

House and lot in good live railroad town, close in, clear, good property, in Alfalfa county, Oklahoma, for jack between 4 and 8 years old; black, white points, 15 hands Standard; quiet and sure. **S. A. Upchurch, Clinton, Custer County, Oklahoma.**

BIG JACKS WANTED

Will buy two big black jacks not over 6 years old. Must show a prompt service, must make a big discharge of semen, with a reasonable sized penis. Sound and well proportioned; colts to show if old enough. Send full description at lowest CASH PRICE in first letter. Be sure and send price for cash. Only Kansas, Missouri, Oklahoma or Texas, need apply. Seller must agree to pay carfare in case jack is not just as represented. Address **"F," care of the American Breeder.**

MUST SELL QUICK.
Will move to New Mexico April 1, having sold farm here. 1 Mammoth black jack, 15½ hands Standard, heavy bone and body, typical head and ear. Sure breeder and quick server, 6 years old. Made three seasons and never sired a bad mule.

1 registered French Percheron stallion, dapple gray, 16½ hands, weight 1,850 lbs. Splendid and sure breeder. Good disposition, absolutely sound—a big bargain.

1 three-year-old pure bred Percheron stallion, dark brown, extra good body and bone. Well broke to service, worth twice the price we ask.

"Rus Squirrel" the best sire of saddle and harness colts in the country. Will show the colts and the horse. This horse will make the price we are asking for him in one season. Come and see this stock or write, **C. N. Moore, Lee's Summit, Jackson County, Mo.**

40--JACKS AND JENNETS--40

6TH ANNUAL

PUBLIC SALE

AT HIGGINSVILLE, MO.

MARCH 6, 1912

A Chance to Get a Good Dr. McCord Jack, or a Jennet Bred to him

These Jacks won 1st and 2nd Missouri State Fair 1911. Sired by Dr. McCord, 1776

This stock consists of yearlings to 5 years old. A lot of good serviceable jacks and jennets of the right kind, all good colors and well proportioned. All registered. Mostly sired by Dr. McCord, 1776.

W. J. FINLEY

Higginsville, Lafayette County, Missouri

50 miles East of Kansas City, on Chicago & Alton and Missouri Pacific Ry.

FOR SALE OR EXCHANGE

One black imported German Coach stallion, 10 years old, weighs 1,500 lbs. Lots of style and action. None better. Colts to show. Will exchange for good young jack 3 to 6 years old. Horse guaranteed; jack must be also. **J. T. Smock, Curdsville, Davis County, Ky.**

TWO JACKS AND ONE JENNET

All black, with mealy points. One jack 15½ hands high. Four years, large bone. One two-year-old jack. One jennet 15 hands high; all heavy boned. Address **Thos. Pegg, Summerville, Texas County, Mo.**

FOR SALE OR EXCHANGE

For a good jack, choice of two registered black Percheron stallions. Registered in Percheron Society of America; also in the Illinois Stallion Registry. Right every way, and jack must be same. I have five stallions and need a jack a good deal, for cash or trade, address **Chal White, Hillsboro, Montgomery County, Illinois.**

THREE GOOD JACKS

With white points. Two coming three, one coming four; one 15 hands high; two 15½ hands high. Well broke, good bodies, heavy bone; first class jacks, good enough for anybody. Address **D. W. Chapman, Adrian, Bates County, Mo., R. 1.**

POLK COUNTY JACK FARM

30 head of jacks and jennets; good as lives. Choice of 40 years' breeding. I have a fine lot of coming 3 and 4-year-old jacks; broke to serve. All black with white points. All the bone and body you are looking for; 14½ to 15½ hands; price low. **R. M. Johnson, Bolivar, Polk County, Missouri. R. 6.**

DEER PARK BREEDING STABLE.
12 good jacks from 1 to 7 years old, black, well bred, and large. 20 jennets, good, and most of them in foal. 6 stallions, 2 registered saddlers, 2 registered trotters, 2 registered draft, one Percheron, one Shire. These horses are for sale or exchange for other stallions or horse or mule stock. This is the home of Missouri Wonder, champion jack of America. Been shown 22 times and won 22 blue ribbons. Come or write to **Sappington & Brockman, Centralia, Boone Co., Mo.**

CLOSING OUT CHEAP.
Two big black jacks; white points; herd headers. One 6 years old, 16 hands Standard, 16 inch foot, 10 inch bone, weight 1,200 pounds; colts to show. One, 2 years old, and three the 8th of August, next, 16½ hands Standard, weight 1,000 pounds, 15-inch foot at edge of hair, 9½-inch bone. Come or write **G. B. Weaver, Harrisonville, Cass County, Mo., R. 1.**

HOME OF THE GIANTS.
75 head of jacks and jennets. Won nearly half the ribbons at Sedalia in 1911. We think we have the finest herd of jacks and jennets in Missouri. We have these prize winners for sale. We handle the big black, big boned, big footed kind. **Bradley Bros., Warrensburg, Johnson County, Missouri.** 65 miles East of Kansas City, main line Missouri Pacific. Right in town.

capsule system last year, and there is no doubt of it being a success when handled according to instructions given in the Scientific Breeding School. I can heartily recommend this school to anyone who is interested in up-to-date horse breeding.—Henry King, Warren, Ind."

"The capsule system of breeding, if properly understood, is all right. One of the most important matters is to know when not to breed. This is a question that calls for much patience on the part of breeders. Prejudice and ignorance on the part of patrons who will not hear all they should know, but give wrong impressions to other would-be intelligent patrons, are causing much loss to progressive breeders, but far more to themselves and the community where they live. No one knows too much to learn more. Success to the School.—Carlisle, Ark."

RAISING JACKS IN THE NORTH.

To the American Breeder: I would like to have the opinion of breeders upon the breeding of jennets and jacks here in South Central Montana. I have been told that a jennet will not raise her foal here in this climate. However, I have a jennet in foal to my jack and would like to know what precaution to take to save the foal. A year ago last summer I had bred two jennets to my jack, both of which lost their foals. I believe one was caused by being kept on green alfalfa pasture all the time. It was a well watered field and the colt was carried full time, and may have lost its life by being foaled on damp land or from many causes, as the carcass was not found for some time after. The other jennet gave birth to a fine, well developed jack colt, except his jaw, which appeared to be deformed. He got up and walked around, and seemed in every way strong, but he could not or would not suck. From my experience, jacks and jennets do well in this climate, and breed well, but as this is the extent of my breeding them, and no foal to live, I am naturally inclined to think the report might possibly be true. A. W. Adams, Carbon County, Mont.

AMONG THE BREEDERS.

Oltmanns Bros., Box 87, Watseka, Illinois, have a large selection of imported Percheron, Belgian and German Coach stallions and mares. Every horse is backed by a square guarantee. Write them for catalog.

Taylor & Jones, Wiliamsville, Illinois, have Percheron, Belgian and Shire stallions at reasonable prices and terms. Send for catalog.

J. Omer Singmaster & Son, Keota, Iowa, have on hand 127 head of Percheron stallions, in good breeding condition. Write him for description of stallions and prices.

Wm. Crownover, Hudson, Iowa, have a November importation of Percherons, Shires and Belgians in fine shape. They have 2-year-olds weighing a ton. Write them for prices, and send 10 cents for picture of horse parade.

W. H. Bayless, Blue Mound, Kansas, have some good imported Royal Belgian draft stallions and mares. Also some pure bred home grown horses, and jacks ready for service. Write them for particulars.

S. S. Spangler, Milo, Mo., writes that the general cold spell, although trying on stock, in that section, caused no losses from freezing, to his knowledge.

With regard to his own herd of Shorthorn cattle, Mr. Spangler is fortunate in being well provided with barns and sheds and in having a class of cattle that withstand the cold. His new herd bull, Royal Marshall, breeds a class of calves that are coated, as well as finely formed.

PERCHERON STALLIONS AND JACKS.

Two Percheron stallions, black, 5 and 6 years old; 1,950 and 2,200. Sound and registered. Hobson took first in the open class with 5 importers in the ring, and 1st in the American bred class at the Nebraska State Fair, 1909. He is a heavy boned, square framed horse and weighs 2,200 lbs. Tricon is 6 years old. Was my choice out of a herd of 200 head of the best stallions I ever saw together. Also 4 jacks from 15 to 15¾ hands, Standard; as good as grow. All registered and fine performers. All of this fine stock is for sale, as I have just turned into my 72d year and can't handle them and will close them out right. **Wm. H. Patteson, Mound City, Holt County, Mo.**

JACKS AND MULES

300 head of Colorado raised Jacks, Jennets, Mules and Brood Mares. All guaranteed. Prices right. **Lewis Swink & Son, Rocky Ford, Otero County, Colorado.**

TWO KENTUCKY JACKS.

Black with white points. One 5-year-old jack; registered; weighs 1,180 pounds; 15¾ hands high, Standard measure; girths 72 inches around heart and flanks; 10 inches around canon bone. Is a very fine show jack, also a good breeder to mares and jennets; have colts to show. Price, $1,200. One 3-year-old jack, eligible to register, 14¾ hands; is good jack well broke; price, $500. **J. W. Ragland, Winchester, Clark County, Kentucky.**

THE KENTUCKY JACK FARM

Established 1884

BREEDER of registered, Mammoth Kentucky jacks and jennets; big bone; plenty of weight. Forty head of 3 and 4-year-old jacks; also young stock for sale. Would be pleased to have you visit my farm for inspection or write for prices. I guarantee to please you. **Joe E. Wright, Junction City, Boyle County, Kentucky.**

CLOVERDALE FARM

Breeders of jacks and Percheron horses. 20 three and four-year-old jacks; 15 yearlings.

Some nice Percheron stallions, mares and colts; also Tamworth Swine. All stock registered or subject to register.

Would be glad to have you visit our farm or write for circulars. **H. T. Brown & Co., Lexington, Fayette County, Kentucky.**

LOOK HERE!

Why not buy now and save $100 on each animal? We have some extra good black jacks, all broke to service, of Mammoth breeding, old enough to make a season; also a few extra good black jennets of the same breding, safe in foal to Big Ben, a 16 hands high, registered jack, weighing 1,200 pounds. Also have some Percheron stallions for sale. We are overstocked, therefore must sell.

W. W. Shott, Lathrop, Mo.
29 miles from Kansas City.

AL. E. SMITH'S Stock Farm

Seventy-five registered Black Mammoth Jacks and Jennets, 15 to 16 hands standard, imported and home bred. Some good Percheron Stallions. More good big boned, high class jacks and jennets than you will find in any one barn. Forty miles west of Kansas City, Al. E. Smith, Lawrence, Douglas county, Kas. R. 1.

20 Black Jacks For Sale 20

Twenty big black jacks, with white points, for sale. Ten, from three to seven years old; five, coming two years old. They have lots of size, bone, quality and style. Write for catalogue. We also have 200 mare mule colts, for sale in car load lots.

SCOTT, ABNEY & JENKINS
Virden, Macoupin Co., Ills.

GREAT SALE OF JACKS AND JENNETS—WILL OCCUPY

TWO DAYS FEBRUARY 26-27

And on these days my customers who come to La Plata will buy at their own figures the blood of the

World's Greatest Prize Winners

THE JACKS are just such as I put out last year to the very highest class trade—great bargains at very moderate prices—and no offering ever gave better satisfaction. I make a little money on these (as they cost no more to feed than common stuff) and the buyer saves a whole lot.

THE JENNETS numbering 25, are unusual values, individually, and what is more, they are bred to the world famous Barytone Mammoth, highest-priced jack ever sold at auction. I having bought the Jennet stud of James Houchin who had this great jack at its head. A few jennets have colts by him.

Write at once for catalogue, as this ad will not appear again.

Sale tent near depot; 24 passenger trains per day.

G. C. ROAN - - ***La Plata, Macon County, Mo.***

TAYLOR & JONES STALLIONS

Stallion buyers, why do Taylor & Jones sell more horses than almost any of their competitors? If you will stop to think, you will certainly know their horses must be better, their prices lower and their guarantee as good as can be written, as every man wants the best value for his money. We can please any customer in either Percherons, Shires or Belgians.

Our first importation in 1912 has just arrived at our barns and in the lot are many high class stallions, and as there has been no great expense on them as yet in the way of feed, care, risk, etc., we can sell them worth the money. If you are looking for a good horse, come and see us.

Caring For The Brood Mares

Non-Producers, A Tax on Producers, May Result From Faults of Feeding, Watering or Stabling. The Present Higher Cost for Mares and Service Calls for More Care.

THE remunerative prices that breeders are receiving for good horses is proving a great stimulus to the production of this class of animals. Never before have mare owners demanded the services of as high class stallions as now. The most conclusive proof that it pays best to breed the good kind is the daily market report, which sets forth in convincing figures the wide range between the meritorious article and the common sorts. Nor has the acme yet been reached, for when an especially high quality individual comes into the ring the keen competition for ownership sends the bidding skyward.

People are demanding better things and common stuff no longer satisfies the more progressive owners of horses. The education that has taken place along sanitary lines, particularly that branch relating to food stuffs, has had a wonderful influence in provoking a greater interest in the appearance of the teams of the packing companies and others that handle these commodities. These people are vieing with one another in cleanliness, tidiness and neatness of their outfits, and the horses have shared in the general clean-up that has taken place.

Animals of greater monetary value than formerly are now being dealt with, which means that the breeder of the present day has more at stake. It further means that if he is to profit most from his business, he must keep his mares in a condition so that they will produce regularly. He must guard against losses through accident and disease, and he must carefully rear and feed the youngsters that they may have the opportunity to grow into mature animals of the desirable class. Breeding counts for much, but unless careful mating is supported by proper feeding and after care, the ugliest scrub apparently may result from high class parents.

Less than forty per cent of the mares bred produce living foals. Failure may be due to so many different causes that we shall not discuss the details of this phase of the subject at this time. It is sufficient to say that the failure to produce finds its origin too frequently in the care given the brood mare. Her sex gives her a highly developed nervous temperament, which means that she should at all times be handled with gentleness. She is capable of doing much hard labor if she is properly handled. This means that she should be in the hands of the most level headed person on the place, who will use her with the consideration due her position. A mare that is fretted and worried and abused cannot give her best to her offspring. A temperament that is capable of being easily excited can be made terribly so by a harsh master and a disposition developed by such a process of handling can be transmitted to her descendants with as great certainty as any desirable trait.

There is no economy in provoking an animal into wasting energy and flesh by harsh measures. No practices should be indulged in that will detract from the mare breeding regularly nor militate against her giving her very best to her offspring. Neither should the owner permit anything to occur that is liable to provoke loss of the young, either while in utero or by the side of the dam. Success means largely the general condition of pastures, paddocks, stables, water supply, feed, etc., in addition to the general care mentioned.

Fences should be built of such material as will reduce accidents to the very minimum. Barb wire is dangerous for horses and is responsible for the ruin of many valuable animals. It properly should only be used in conjunction with some other type of fence, and is wholly unsuited for small enclosures. Woven wire is proving to be highly satisfactory as a fence for horses and may now be obtained at a price within the reach of the majority of horse breeders.

FANCY FARM MARE; WEIGHT, 1,350 POUNDS; VALUE, $185. SEE "WHAT CONSTITUTE HORSE VALUES," PAGE 5.

Fences should be kept in order for safety's sake, if for no other reason. Loose wire has maimed many more horses than has the tense wire on the lines of fence. Particularly does this apply to loose ends that are permitted to lie about the lots. The slovenly habit of permitting loose lumber, especially when full of rusty nails, to be scattered about the premises, is costly to the individual who allows it, for these unobtrusive agencies stand for tetanus, blood poison and death.

An easily accessible supply of good water is all important on any stock farm. The major portion of the body is composed of this fluid, and for the greatest thrift of the animal it should have the opportunity to renew the supply at will. A mud hole about the drinking place is too many times in evidence and often with no good excuse whatever. The surroundings of springs can nearly always be made dry, while the overflow from troughs and tanks should be properly taken care of when installed. Nothing encourages abortion in a mare more than for her to rush with her mates into a mud hole up to her knees in quest of water, and as horses drink several times a day if given the opportunity, a mire becomes a serious menace to this class of stock on the farm.

It is poor economy to force any animal to drink ice water and it pays to take the chill off the same by means of some of the effective heating devices that are on the market. The month of January just past has been a severe and costly rebuke to the man who had not prepared the proper watering facilities for his stock. The present high price of all kinds of foodstuff for stock should be a reminder that water (the very cheapest ingredient, as well as major portion of the body) should be given more careful attention.

The diet apportioned the brood mare should receive due consideration. What it shall consist of may be governed largely by whether or not the mare is worked. Inasmuch as she should always be given the opportunity to take plenty of exercise she may be utilized in quite a measure as a scavenger of the fields. There is much forage on many farms that is not suited for work stock that may be saved and utilized by this class of animals. The chief thing to keep in mind is its wholesomeness.

At no time should horses and especially brood mares be forced to eat spoiled, moldy or weedy forage or grain. Extensive loss has attended pasturing corn stalk fields this winter, which appears to be traceable to poisonous substances developed in the corn, due to worms. A sufficient supply of grain should be fed to maintain the flesh of the mare, always remembering that two lives are calling for support. No single grain so nearly supplies the ingredients most needed by the bodies of work animals and brood mares as good sound oats, and an effort should always be made to make this cereal a part of the ration at least. A variety of feed is usually eaten with greater relish, but one should always be cautious about making any sudden changes in the diet, lest an attack of colic be induced.

Colic in a mare that is with foal is always a serious matter and frequently terminates in either the loss of the fetus or the dam as well. In the pregnant mare it may result in abortion or in a twist of some of the abdominal or generative organs due to the rolling of the animal in her efforts to secure relief from pain. The veterinarian is always handicapped in treating colic in mares with foal, for the reason that some of the measures he employs with the greatest success in ordinary cases are not admissable in pregnant mares.

The brood mare is deserving of better housing during inclement weather than her mates, for the reason that her condition does not admit of her running about to keep warm as it is the nature of horses to do when chilled. She should be provided with a clean, well lighted and ventilated box stall as she nears foaling time, which should be kept well bedded with clean bright straw. This is very important regarding the mare that foals early. Many cases of navel ill are contracted from filthy stalls, so that it is the better practice to put things in order early, for the reason that one cannot foretell just what day the arrival of the colt may take place. Cleaning up after the foal has arrived does not meet the case, for the reason that the disease is usually contracted during the first twenty-four hours of the life of the foal.

Mares often become very nervous and irritable as they near foaling time and an owner should be charitable during this period. If everything goes well during the process of foaling it is well not to disturb the mare or foal but let them have absolute rest. Too much meddling at this time creates excitement in the mare which may result in injury to the foal.

A half pail of water is sufficient to give directly after foaling. This amount should be again offered in a few hours.

The amount of feed, especially grain, should be decidedly diminished for several days and very gradually raised, lest a milk flow be encouraged that may excite inflammation of the udder or cause indigestion in the foal. A warm sun bath in a protected spot for a few hours daily is one of nature's best tonics for the

young, and should always be taken advantage of whenever weather conditions will admit.

A mare should be kept quiet for several days after foaling, in order to give the generative organs sufficient time to retract to their normal form. She should gradually be accustomed to exercise by permitting her access to a paddock and usually, in the course of two weeks, may be given light work if needed.

Mares which do not produce regularly are not profitable brood mares and many of them lose their owners much money, as a result of not producing. These mares eat up a part of the profit of the regular producers.

This illustrates the necessity of taking the very best care of our brood mares, for if they are not managed properly, nature will be interfered with and cause them to be shy or irregular breeders.

If enough mares owned on a farm are made shy breeders, to eat up all the profit that the producers make, the owner of such mares might as well own geldings. But the farmers must keep mares and take better care of them, in order to supply the great demand for horses in this big country.

RECORD OF A GOOD BROOD MARE.

To the American Breeder: I want to tell about Old Queen. She is a bay mare about 15½ hands high, weighs when fat about 1,250. She is 18 years old, her sire was a Norman and Shire cross. She was foaled mine, she has raised 11 colts, one horse colt and 10 mules, seven of the mules being mare mules and three of them were horse mules. The colt was a horse colt. All were good colts.

I commenced breeding her at 2 years old, and she miscarried twice, and missed getting in foal a few times when bred. She is a good work animal and I have made several crops with her, so you see Old Queen has done good service for me. My advice to small farmers who keep one team is to get two good mares and breed them to a horse or jack and they will raise good colts and do your farm work, too.

Good young horses are very scarce in this part of the country and are bringing good prices when sold. Mules are a little more plentiful but are being sold all along for a fancy price. There has been a fine improvement in horses and mules in this country in the last few years. We have a very good supply of breeding stock in this community. I have an interest in a fine German Coach horse, I am keeping him at my barn. I find him to be of a good, kind disposition. We got him on the 4th day of last March, and are expecting a fine lot of colts this spring. In my estimation the German coach is the horse for this country.—Pinkney Reynolds, Burnet county, Texas.

HAS PRODUCED 13 COLTS.

To the American Breeder: I have a brood mare that I think is hard to beat. She is 17 years old and has had 13 colts, has been worked every year since 3 years old. She is sound as a colt, and I believe will do as much work as she ever did. If anybody has a mare that can beat mine, I will give up.—Wm. Rawlings, Morgan county, Colorado.

FEEDERS' AND BREEDERS' SHOW.

The management of the National Feeders' and Breeders' Show, to be held at Fort Worth, Texas, March 18 to 23, is looking forward to a meeting of unusual success. Among the regular events and features of the show will be the exhibits of fat cattle and hogs, light and heavy weight horses, poultry, products of land and factories and especially the Cattle Raisers' Convention, and the usual social events for the attending ladies, as well as their husbands.

Advertising Stock For Service

How to Let Mare Owners Know That You Are Standing Good Stallions and Jacks---Advertising Suggestions---Keep Stock Clean and Presentable

NO one thing is more essential in the breeding business than proper advertising. This is the season to begin this work, which usually causes most breeders considerable trouble or worry. Many are not familiar with the best methods and forms. It must be remembered that it takes a certain amount of business to pay the actual expenses of keeping a stallion or jack for a certain length of time. If there is not enough business to pay the required expenses, then it is conducted at a loss. The increase over and above the actual expenses is the profit.

The up-to-date business houses use every honorable means to get prospective customers to their store or offices or barns, even if they see little hope of effecting a sale. From some individuals, these modern houses figure, they will probably get some benefit through their knowledge of their business which they will receive by visiting them.

This is the best time to do your advertising—before the farmers get to work. They are now deciding what stallions or jacks they will use. A great many of the best stallions and jacks are not profitable, because they are not properly advertised. This matter of advertising is getting more important each year in every line of business, and it must be studied more thoroughly by the horse breeders.

The most direct way of advertising stallions and jacks is to first get a complete list of all the mare owners in one's vicinity. It does not matter whether these men are all customers, or not. Get them on your list. You want them for customers. Keep this list up-to-date, the same as the mail order houses keep their list. When a new prospective mare owner moves into your vicinity, get his name and address and rural route on your list.

One must judge for himself as to the size of his territory. Some men expect to draw trade for only a few miles in each direction, while others draw trade for a great many miles and even extend into other states. The average breeder should have every farmer within several miles on his list. Those having herd headers should get a list of men who own pure bred mares over several states. The cost of this is small, and it is direct advertising.

A postal card, the regular size, will do to start with. Then other forms of printed matter may be taken up later. Go to your printing office and tell the printer that you want him to print a certain number of postal cards with typewriter type. One usually knows what he wants to say on the card and it might be a good plan to have the printers make certain corrections in this reading matter, but don't let them change the meaning. The following is a good form to start with:

To Mr. (give his name):

The following breeding stock (describe stock here) will stand at my barn (give location of barn here) from April 1 to July 1. I am permanently located here and expect to remain with you through fortune or failure. I am making a special study of foal production. Will be glad to answer any and all questions pertaining to the breeding business. I hope to have your support in improving the horse flesh in this district. If I do not have what you want, be frank to tell me and I will try to meet your demands. I want your business and will treat you right. Your loss is my loss, and it is my business to see that my customers get their mares in foal. I have learned much within the last year pertaining to this subject which will be of interest to you.

Yours truly,
JOHN SMITH.

A post card, with something like the foregoing on it is the most direct way of advertising. Another card in three or four weeks with different reading matter will also be very effective. Then, about the first of April, a postal card notifying your patrons when their mares are due to foal would have considerable weight. A postal card form could be made something like this:

Your (color) mare, (name).....
.....will foal about.....
Then you can go on and have some more good reading matter printed on this card, asking them for a continuation of their business, mentioning your added ability, increased facilities, etc.

The above printed form is very easily arranged and the blank spaces can be written in with ink. The mare owners will appreciate this very much and in many cases it will often save colts.

When bills are to be printed, they should be sent direct to the mare owners. If any cuts or illustrations are to be used in the bills, be sure that they represent your stock. Sometimes we see a Clydesdale cut used for a standard bred horse, which more than being merely inappropriate, is liable to work an injury to the individual standing of such a stallion. One cut might represent all black jacks, or a black Percheron might represent all black Percheron horses, but it is usually better to have something as near like your animal as possible.

Another good way to get business is to prepare your stallion with a good coat of hair. Have his mane and tail done up in yarn and ribbon. Lead him through town on Saturdays. Take him to public sales and get as many people to see him as possible, but always be sure that he will make a good appearance when people have an opportunity to cast their optics on him.

Another good stunt is to make announcements in a country newspaper that reaches all of your customers, paying the editor for printing locals in the local reading notices. Do not let him put it in the back part of the paper. See that everybody reads that notice. If you do not know how to word these locals, have your editor do it for you. Nearly all of them will do this,, if you pay them. Have different reading notices in each issue.

All of this advertising will not cost more than $25, and if the territory is not too large, it should be done for $10. Some may ask what the cost of the postal advertising would be. One hundred postal cards will cost $1, and the expense of printing these cards should not be much more than that. After you have accumulated the list of mare owners that you want, the addressing can be done at home. There is usually some one in the family who can write a good, plain hand that can do this work easily. A record should be kept of the names that a particular card has been sent to; also a copy of the card, so that the next one may be sent out containing different reading matter. In preparing these postal cards, it might be well to leave a space at the bottom for a written signature. If a signature is signed with a pen and the body of the card is prepared in typewriter type, the entire card is likely to be read more closely and given more attention.

Some breeders watch the sale of their colts and when several high priced ones are sold from their stallion or jack, they immediately have that fact printed in the local paper, and also on postal cards and send it out to their mare owners, calling their attention to these results from breeding to their sire or sires.

IT'S TWICE A MONTH, YOU KNOW.

Our friends, who for the past three or four years have been regularly sending in their advertisements to the Stallion and Jack News at this time of year, are reminded that the AMERICAN BREEDER (with which the Stallion and Jack News is now combined) is issued twice each month. The issues are dated the 5th and 20th of each month, but advertising copy to be sure of good position should be in this office by the 1st and 15th.

There is a big tendency toward semi-monthly advertising, many breeders as well as commercial concerns, having found it more economical than weekly advertising and more effective than monthly advertising. A regular advertisement in the American Breeder presents your proposition, at just about the right intervals, to over 30,000 breeders and users of improved live stock, who pay for the paper for itself, alone, and who READ EVERY ISSUE.

BRED A PREGNANT MARE.

To the American Breeder: In looking over your last issue of the American Breeder, I could not help remarking what a boon your paper was to breeders of mares and also to the stallion and jack owners, as it is up to date in every particular. After reading one issue it seems almost necessary to the breeding business, and I don't really see how mare owners, or stallion owners either, could get along without it—after reading one paper, anyway.

I have two stallions, one a Clydesdale and the other Standard bred. I was called today to a mare aborting. This mare had been throwing off a little. The mare owner, thinking she was in heat, opened this mare up, as he called it, at noon yesterday without even trying her. In the afternoon he took her to a stallion to be bred, and bred her. They found her laboring this morning and I was called to help her deliver the foetus, which I did. This mare was bred to foal the latter part of July, so the mare owner informed me. Now, I think if he had been taking the American Breeder that he would hardly have tried to do as he did with this mare, and would have saved his colt and in all probability the stallion owner his fee. But such is life.—Dr. Wm. Readhead, Taylor county, Iowa.

SALTING BREEDING STOCK.

All breeding stock should have an abundance of clean salt where they can get it at their pleasure. Plenty of salt is a necessity in breeding livestock. There is some danger, however, when pregnant females have not had any salt for a considerable length of time. This is more noticeable in jennets than in mares. Every stallion or jack should have salt every day. A very good method is to have a salt box in the corner of the feed box.

What Constitute Horse Values

General and Special Requirements for Filling the Different Horse Market Classes. What is Meant by the Terms, "Soundness," "Condition," "Quality" and "Conformation."

BEASTS of speed, draft and burden occupy a different position from animals of the meat producing class. A steer might have a serious blemish which would interfere with his propelling power, but when fattened would sell for so much a pound regardless of the blemishes, so long as they did not interfere with the value of the meat. But geldings are not sold by the pound. They are disposed of according to the amount and kind of labor they can perform, their appearance and behavior. There are six classes of market horses, and the market value of these different requirements is well established in the regular horse markets. They are as follows: Draft horses, chunks, wagon horses, carriage horses, road horses and saddle horses. These six market classes are subdivided into about twenty different sub-classes, which are designated according to their height, weight, conformation and ability to perform certain kinds of work. The surplus horses usually find their way to the horse markets, where they are sold at auction to the highest bidder. Some of these are taken to other horse markets and resold, while others are purchased to be retailed. This is where the standard of value is placed on horse flesh, which regulates prices generally.

There are too many horses produced that do not meet the requirements of these well known market classes. This is partly the result of breeders not using the right kind of sires. We print an extract from Bulletin No. 122, prepared by Professor R. C. Obrecht, Agricultural Experiment Station, Urbana, Illinois, which is as follows: "The factors that determine how well horses sell upon the market are soundness, conformation, quality, condition, action, age, color, education and general appearance. The requirements placed upon the above factors, together with minor considerations, are discussed below.

SOUNDNESS.—To meet the market demand, a horse should be serviceably sound, by which is meant one that is as good as a sound horse so far as service is concerned and able to do a reasonable amount of work without undue fatigue or indications of a premature break-down. He may have slight blemishes, but nothing is permitted that is likely to cause lameness or soreness in any way. He must be in good wind and eyes, but may have small splints and puffs and a little rounding on the curb joint. Broken wind, thick wind, side bones, unsound hocks, such as curbs, spavins and thoroughpins, large splints and buck knees are discriminated against.

CONFORMATION—If a horse is to do hard work with a minimum amount of wear and give the longest possible period of service, he must possess a conformation indicative of strength, endurance and longevity, the indications of which are, good feet, a good constitution, good feeding qualities, good bone and symmetry of conformation. For city use too much emphasis can hardly be placed upon the requirements of good feet, for the old adage, "No foot, no horse," is still true; but in horses for farm use it is not so important, as they rarely break down in their feet. A good constitution denotes health and endurance, which is indicated by a deep, capacious chest, giving sufficient room for well developed vital organs. Endurance is also evidenced by the indications of a good feeder, which are a short, well muscled back and loins, a deep barrel, with no tucking up of the rear flank, and closely coupled (coupling is the distance from the last rib to the hip.) A good bone should have enough weight to correspond with the size of the horse; it should be of good quality and must not be unduly small at the knee or hock. Symmetry of form is necessary for strength, correct proportions and perfect development.

In order that there may not be an undue amount of concussion, which would produce soreness or disease and render the period of usefulness of the horse short, he should have an oblique shoulder, a rather short cannon, a moderately long pastern set at an angle of about 45 degrees. The hind pastern should be less oblique than the front pastern, with no tendency toward a conformation known as "coon footed" (long and very low pasterns.) The foot should be of good size, the horn dense, the heel wide and high, permitting a large healthy frog to serve as a cushion in breaking concussion. Side bones are an unsoundness found most commonly on heavy horses. They are more often found on a horse with a straight shoulder, a short straight pastern and a narrow hoof head, as horsemen would say "a post leg that produces stilted action."

Since the forequarters or front limbs of a horse carry the greater part of the horse's weight, they are often termed the "weight carriers," and the hind quarters the "propellers." Because of this fact the set of the shoulder, pastern and foot is of great importance and should possess enough obliquity to give a free, easy movement to the action. The width of the hips should be in keeping with the other parts of the horse, but not prominent. The croup should be long, well muscled and not too drooping. The seriousness of the objection to a drooping croup will depend upon the class, but in any class it is unsightly and detracts from the value of the horse. The tail should be set high, well haired and stylishly carried. The quarters and thighs should be heavily muscled, according to the class to which the horse belongs; the hocks large, strong and free from puffs or any unsoundness; the cannon short and broad, the tendons and ligaments prominent and well defined. There should be no tying-in of the tendons below the knee or hock, because it gives a light appearance to the bone. The head should be of moderate size, with clean cut features, large mild eyes, ears rather small and not set too far apart. The head should be properly set on a neck of moderate length, with a rather thin, well developed crest. A large horse with a small head is almost as unsightly as a small horse with a large one. A long-legged, narrow-chested, wasp-waisted, loose-ribbed, long-coupled horse is always to be avoided and is a cheap animal on the market. The different classes possess special requirements of conformation, which will be discussed in detail elsewhere in this bulletin.

QUALITY.—Quality in a horse is of prime importance. This term, when applied to horses, has reference to their bones, skin, hair and muscles. Its presence is shown by clean cut features of the head; firm, clean bone; tendons well defined; close fitting, glove-like skin; hair fine and silky; an abundance of finish; an absence of coarseness, but not necessarily a small bone. When slightly exerted the skin will show clearly an intricate network of veins. Coarse hair is usually associated with a coarse skin and a soft, spongy bone, which is weak and subject to disease. With quality the muscles stand out prominently and are clearly defined, which aids in giving a horse finish. Quality is a strong indication of the extent of a horse's endurance. These two characteristics are closely associated and a horse lacking in quality is comparatively a cheap animal.

CONDITION—To be appreciated on the market, horses must be in good condition, carrying a thick covering of firm flesh and possessing a good coat of hair, which gives them a sleek appearance. Condition is most important in heavy horses, such as draft horses, chunks and wagon. Some men are making good profits by buying feeders on the market and shipping them to the country to be put in condition, after which they are reshipped and resold. Whether or not this added flesh increases the animal's real value for utility and longevity is not necessary to consider here; since the market demands it, the producer can well afford to supply it. Careful estimates on the value of horse flesh made by reliable authorities put it at 25 cents per pound on heavy horses weighing 1,500 pounds and upward. This fact has been verified by an experiment in fattening horses for market conducted at this station. It can readily be seen that the producer cannot afford to let some one else reap this profit.

ACTION.—The action of a horse is not of equal importance in all classes. There is probably no other one thing that counts for more in bringing high prices in the carriage, road and saddle classes than action. In other classes it does not count for so much, but every horse should have good action. He should be a straight line mover, picking his front feet up and carrying them straight forward, placing them down again without winging out or in or interfering. The hind feet should follow in line of the front feet. and work in uison, without "interfering," "hitching," "cross-firing" or "forging." The action should be strong, bold and full of energy; the form and height of

HEAVY DRAFT: WEIGHT, 1,700 POUNDS; VALUE, $250.

MATCHED PAIR WAGON HORSES, 2,400 POUNDS, $375.

action will depend upon the class to which the horse belongs. This subject will be taken up more fully under various classes.

AGE.—Horses sell best from five to eight years old, depending upon the class, maturity and soundness. Heavy horses, such as draft and chunks, sell best from five to seven years old, but a well matured four-year-old in good condition will find ready sale. Carriage, saddle and road horses sell better with a little more age, because they do not mature so early and their education is not as young as with heavy horses. They are most desired from five to eight years old.

COLOR.—As a rule the color of a horse is not an important requirement if they possess individual excellence. Almost any solid color is not objected to on the market unless it is by a purchaser who has a special order to fill. However, more discrimination is made against color in light horses than in heavy horses. The reason for this is that the one is for business and utility purposes, while the other is principally for dress and pleasure. There is also more discrimination made in the color of animals that grade as choice than there is in those that grade in medium and good. All solid colors except white are in good demand, while a "flea-bitten gray," a "mealy bay," or one that will fade or "wash out" is not desirable. Choice steel gray, dapple gray and strawberry roan horses of the draft, eastern chunk and wagon horse classes are in strong demand from showmen, packers, brewers, wholesale mercantile houses and firms who want their teams to attract as much attention as possible and serve as a walking advertisement. The demand is good for bays, browns, blacks, chestnuts, sorrels and roans; matched pairs sell better than single horses. In the light horses, and especially in the carriage and saddle classes, bays, browns and chestnuts sell best, but a good paid of well-matched blacks or iron grays find ready sale. In the fashionable trade a white horse is not wanted except for hearse purposes and to fill an occasional demand for a cross match coaching team. A more popular hearse horse is coal black, with no white markings, and he must also have a long, flowing tail. Occasionally they are accepted when slightly marked with white, which is less objectionable on the hind feet than on the face or the front feet.

EDUCATION AND DISPOSITION.—Every class calls for a horse of good disposition and well educated for his work. If it is a draft horse he should be a free worker and a good puller, free from vice and bad habits. If it is a carriage horse, the requirements are the same, but he should be much better educated and mannered, and should be indifferent to sights and sounds such as cars, automobiles, etc., which frighten most horses. It is readily apparent that a thorough education is much more necessary in some classes of horses than others, for on the crowded city streets where there are often large numbers of pedestrians it is quite necessary and essential that a horse should "keep a level head." The disposition of a branded horse (an indication of a range horse) is quite an important factor; because when he is sold, if he is at all timid and inclined to pull back when a man enters the stall, the buyer has the privilege of refusing him, and if refused, the horse must be sold again as a "reject."

SEX.—Sex is not of great importance in the market; however, geldings sell better than mares for city use, as there is some liability of mares being in foal, and if not, the recurrence of heat is objectionable; but for farm use and the southern trade mares are preferred because farmers buy horses with the expectation of breeding them.

Our Harness Horse Talk

The Interest Which Always Attaches to A Field of Youngsters Makes Early and Natural Speed an Important Breeding Consideration

Written for the American Breeder By Henry Ten Eyck White

IT is not to be denied that the most important factor today in the systematic breeding of light harness horses is the matter of early and natural speed in the foals.

The day when people broke their horses to harness at the age of 3 or 4 years has passed forever, and with the knowledge that foals may, without the slightest harm to themselves, be made accustomed to the harness as yearlings and be taught manners and driven so that some idea of their natural speed is obtained there naturally arose the desire to race them at 2 and 3 years of age, just as had been done for centuries with the thoroughbred horse. Then followed the promotion of valuable stakes and purses for colt trotters until now fully $100,000 is offered every season for 3-year-olds, and each year witnesses an increase in the amount of money so furnished by race track managers who are enterprising and alert.

Furthermore, the most important tracks in the country have found that a colt race where a field of high quality is assured will draw as many or more people through the gates as the old fashioned big purses—which still are part of the program, but not regarded as the piece de resistance of the week's entertainment. This was well illustrated in 1909 at the Detroit grand circuit meeting where a purse of only $1,000 had been offered for 3-year-olds through the insistence of a few members of the organization who were desirous of experimenting as to whether or not colt trotters could give a good performance in July, it being a sort of superstition among horsemen that no 3-year-old was "ready" until September at the least. That race was won in 2:12¼, 2:10½ by Nancy McKerron, and the head-and-head finishes between the daughter of Nancy Hanks, driven by Andrews, and the beautiful filly, Soprano, with John Dickerson in the sulky, were productive of such excitement and enthusiasm that even the doubters were forced to admit the drawing power of colt races, while the hide bound gentlemen who had argued that a 3-year-old could not be "ready" in July were amozed and chagrined. The following year a further step along the road of progress was taken when a 2-year-old race was staged, and that resulted in three heats in 2:14¼, 2:13¾, 2:14½, Azoff winning the first and Necia the next two. Moreover, Azoff was trained and wintered in Illinois, which exploded the theory that a Northern colt had no chance against the Memphis and Lexington brigade.

So the question of colt racing in July was settled, and the further one of whether or not such events were a good card for a grand circuit meeting also was disposed of. Last year the 3-year-old trot at Detroit not only was the feature of the meeting, but it completely eclipsed, in preliminary interest and in its drawing power at the gate the $10,000 M. and M. purse for green trotters and the $5,000 C. of C. purse for pacers of the 2:13 class, which events previously had been the headline features of the annual show. What Miss Stokes, Margaret Parrish, Mainleaf and the other probable starters did in their work for weeks before the race was wired to all parts of the country, and on the day the stake was decided the crowd was the best of the entire meeting. And the record was lowered to 2:08¾ the first heat trotted—a performance which would have been considered good in the Kentucky futurity, decided in October.

It is probable that more than one hundred 3-year-old trotters entered the 2:30 list in 1911, and this statement is based on the fact that I have a list of 49 that are from record dams. It is more than likely that a greater number from dams without marks "made" the list, so a total output of 100 3-year-old trotters in 2:30 or better during 1911 is a conservative estimate. These 49 trotters from record dams furnish a lot of information, much of which is valuable alike to the breeder and the horseman. I have made up the list with the names of the fastest 3-year-olds first, and it reads as follows:

THREE-YEAR-OLDS FROM RECORD DAMS.

While this list does not include the best 3-year-old of 1911, Peter Thompson, 2:07½, it is a very representative one, and the men who believe that, as a whole, mares with records will produce more speed than those which had no capacity of their own in that particular need not be ashamed of it. Twelve of the brood mares named have trotting records of 2:15 or better, among them Fereno, 2:17 at 2; 2:10¾ at 3, and 2:05½ at maturity. Then there is Expressive, 2:12½ at 3, and Nancy Hanks, 2:04, that could trot well as a 3-year-old.

One mare in the above list deserves a line—Silk Mill Girl—as she had a 2 and a 3-year-old enter the list last year. As the mare took her record of 2:19¼ in 1906 she shows to be a quick producer as well as a good one. Both her record foals are by Ed. Custer, 2:10. He was a colt trotter, taking a record of 2:16¼ at 2 years, but a good deal of the merit of the foals of Silk Mill Girl must be attributed to the fact that she is by Alcryon, 2:15, and he was by Alcyone, 2:27, a horse whose blood seems never to lose its potency.

On the other hand, there is in the above list an instance of a successful brood mare apparently going back a little. The 3-year-old Margaret S., 2:27½, is by Peter the Great and out of Marguerite A., 2:12½. When Onward was alive Marguerite O. was mated with him and the foal was Margaret O., 2:05¼, a very high class performer. Peter the Great can not be rated below Onward as a sire, so the inference must be that the "nick" between him and Marguerite A. is not as good as that with Onward. Margaret O., I am told, has every prospect of becoming a fine brood mare, and she ought to do well when mated with Peter the Great, as from another record daughter of Onward he got two champion colt trotters in Czarevna, 2:07¼ at 3, and Grace, 2:08 at 3 and 2:05½ at 4.

Still, the real crack mares, as performers, of some families frequently do not accomplish much when put to breeding. Take Fereno, 2:05½, best of the Mokos. She has not yet produced anything to approach her own record, either in colthood or at maturity, the filly, Princess Hall by Walnut Hall, that took a time mark of 2:15½ last summer being the best. One of her earlier foals, a colt by Walnut Hall, is to be trained this year by W. J. Andrews, and from that fact and the further circumstance that it is owned by J. E. Madden I deduce that the stallion must be a good one, as Madden is not in the habit of paying training bills on anything but first class material.

Andrews will be pretty well equipped for the 2-year-old stakes this year if all goes well with Belwin McKinney, 2:21¼, as a yearling last fall. No colt of that speed as a yearling has ever been eligible to the big stakes for 2-year-olds, and it is indeed fortunate the son of McKinney is to be prepared by Andrews, who is one of the real master hands when it comes to training a trotter of any age. He did well last season with Princess Todd, winning all her races but one and marking her in 2:12½. She, too was a good yearling, 2:24¼ being her performance at that age, but Belwin McKinney generally is considered to have outranked her by quite a margin, and his 2:21¼ mile did not represent all his speed.

It may be that Princess Todd will dominate the 3-year-old events next summer as much as she did those for 2-year-olds in 1911, but I doubt it. As a rule the top notch 2-year-old is

(Continued on page 14.)

Breeding Season Preliminaries

Suggestions For Getting Stallions in Best Possible Condition. Best Seasons for Breeding and Why. Regulate the Feed, Groom Well and Do Not Dope.

THIS is about the time for breeders to begin making arrangements for next season's work. In order to get the best possible results during any breeding season, it is necessary to prepare the stallion. The first few weeks of a breeding season are often passed with poor results. The principal reason for this is to be found in the management of the stallion. One mare should be bred the first week, two mares the next week and three mares the following week, increasing a mare a week, until the number desired is reached. This is not always easily done, but mares might be borrowed for this particular use. At any rate, it is necessary that the stallion should be opened up and put in a proper breeding condition. Those who have examined the spermatozoa early in the spring from stallions not receiving a service for several months know the necessity of these early services.

The returning of these mares is not always due to the stallion, for mares do not conceive as readily early in the spring as they will later on, when the weather begins to get warm and the shedding process is started. Nature has much to do with fertilization and especially different climates. We find the female in the extreme north difficult to fertilize until late enough to bring her offspring forth under favorable weather, while in a warmer climate fertilization may be effected at any time of the year, although it is usually a little more difficult in the warmest part of the season in the extreme south. The most profitable time for mares to be bred, either for the stallion owner or mare owner, is usually so that the colt will be foaled while the mare is running on grass.

The exercise and the feed should be increased at the same time. Stallions which are worked on feed wagons or other ordinary farm work are usually in much better condition than those which are handled otherwise. The working of stallions is a delicate matter and should be handled with care. Some of the extra sure breeders have had little exercise, but those animals are an exception. On the other hand, it is not advisable to send a valuable stallion out with a careless driver or feeder. If a stallion could be worked four or five hours each day at ordinary work and be properly fed so as not to cause any trouble along the digestive tract, it would always be more satisfactory from a producing standpoint. It is not usually advisable to put a valuable animal in as a regular slave, where the animal is expected to do an enormous amount of real labor. The amount of work or exercise necessary to produce the best results depends upon the individual. It requires a certain amount of nutrition to supply the propelling power of work animals, and if the work should be too heavy, it would detract from the stallion's life giving power. This is especially true where a stallion is expected to make a large number of services. Take, for instance, a race horse that is drilled down hard. He will not stand as many services as the stallion that has been handled reasonably.

Occasionally we see a stallion used for farm purposes that does an exceedingly large amount of actual labor and produces an exceptional lot of colts.

A stallion making only one service a day can stand more actual labor than a stallion that is required to make two services a day; especially a stallion that discharges a large amount of semen at each service. To properly exercise a stallion, he should be given one mile of exercise the first day, then gradually increase that exercise up to about the amount that he is to receive during the entire season. My meaning should not be misconstrued to say that he should have a large amount of exercise all in one day and then not have any more during the week. The exercise should be regular each day.

Those living in sections where oats can be had should feed oats and bran about equal parts by measurement, beginning at this time of the year with a reasonable amount of food and gradually increasing as the season advances. The bowels should be the guide of all experienced feeders. If the excrement should smell too strong it is evidence that that particular horse is getting too much grain. If the bowels should be too loose, diminish the bran ration. If the animal does not advance in spirit, increase the oats slightly. If the increase of oats does not have the desired effect, decrease the amount of hay and add a little more oats. It is much better to feed dry feed, as there is less danger of sickness connected with it. We are frequently asked if wheat or rye or ground kaffir corn is good feed for a stallion. There is no well founded reason why any of those feeds should be fed to a stallion, as the chances for sickness are greater with these feeds than most any other kind. There is no particular benefit derived from feeding them. A very small quantity of any of these grains might be fed in connection with the other feed, but the proportions should be very small.

HEAVY DRAFT; WEIGHT, 1,600 POUNDS; VALUE, $240. SEE "WHAT CONSTITUTE HORSE VALUES," PAGE 5.

The owner of each stallion should have a self feeder, the lumber for which can be purchased for less than a dollar, and will pay for itself each month, and with some stallions each week. In addition, it is much healthier and better for the stallion. Some stallions bolt their feed badly; others—nervous stallions—will eat all of their feed in a short time. The self-feeder forces them to eat slowly, keeps them from bolting their food and insures perfect mastication. Those nervous stallions that are thin in the flank can often be remedied by forcing them to eat their feed slower.

Where the proper feed, which is always oats and bran, cannot be purchased for stallions, then crushed barley or even corn may be substituted. Barey makes an excellent feed, but should always be crushed, as it is usually too hard for the horse's teeth.

When corn is fed, some bran should be given in addition, or a reasonable amount of alfalfa in its stead. A reasonable amount of alfalfa is usually considered good feed for a stallion, but he should be used to it several weeks before the breeding season starts; otherwise certain organs may be worked to excess for the best results.

Everything pertaining to breeding should be done with much regularity, and especially the feeding process. We have often called attention to the fact that some feeders could keep a horse looking better with one-half the expense than another man could possibly do.

Where animals are fed regularly there is little chance for sickness, but those who feed one time and then skip a meal are always having trouble with sick horses. The digestive organs remind one of a threshing machine. If the system is fed too rapidly, the machinery is bound to clog, but if the proper amount is fed with regularity, everything takes its regular channel and no one part of the system is taxed too heavily.

The exercise—whatever may be administered—should not be given soon after the stallion has had a large feed. No stallion should ever make a service on a real full stomach.

There are a lot of notions among breeders that certain feeds, medicines, eggs, etc., are absolutely necessary for a stallion to get the best results. The best medicine that any stallion ever received—from a breeding standpoint—is regular feed and exercise, with a limited amount of service. If all stallions were thoroughly prepared before the breeding season starts, there would be little use for any of these notions; they would cease to exist.

All drugs should be kept away from all breeding stock, unless it is the intention to ruin the animal as a breeder. There are tonics, however, that might be administered to sharpen the appetite, but this is not necessary if the stallion is started in time.

One of the most serious drawbacks in the breeding business is that many owners of valuable animals think that the cheapest man that they can get to handle their stallion would be the best. The reverse is true, however. The time has now come when stallions are being handled in a business-like manner, and we wish to say that the breeding business is not a boy's play. Those who are not in a position to handle a stallion intelligently should advertise him for sale.

It is now time to begin to look after the appearance of the animal. He should receive his regular cleaning up and an abundance of brushing to get the hair in a healthy condition. A light blanket might be applied and kept on through the entire season, but we do not advocate using a blanket until the flies begin to put in their appearance. The mane and tail should be cleaned out and the hair all separated. This should not be done with a currycomb, but with the fingers. The currycomb will cut and break too many hairs and lessen the length of the hair. A good brush should keep the mane and tail in good condition after it is once straightened out nicely.

The feet should be looked after, too. See that the dirt is cleaned out around the frogs and in the crack in the frogs. It is usually a very good plan to tamp salt around the frog. This usually has a stimulating effect on the frog and keeps it healthy.

If much exercise is to be given, a light set of shoes should be in order, but there should be no sharp corners on the shoes if they are to be kept on during the breeding season. In most cases it would be just as well not to shoe the individual, unless absolutely necessary.

One of the essential things is to clean up the premises. Haul all of the manure away. Whitewash the inside of your barn. Fill up the stallion's stall with good clay. Improve the drainage around your barn. No one should expect good results unless the sanitary conditions are right. These things do not cost much money, and the work can usually be done at odd times.

About this time of the year we usually find the stallion's sheath in bad shape. The best remedy for this is to take clean bran, pour warm water on it, and insert the bran into the sheath, handful after handful; then twist the hand around in the sheath so that the bran will reach all parts of it. This operation will clean out all foul substances and leave the sheath in a nice condition. If one operation is not enough, repeat it again in a few days. The sheath of a stallion should always be kept clean and in a healthy condition, as it is a culture for disease germs. No soap or grease should ever be used in the sheath or on the penis, but any water used on these parts should be at about body temperature.

Just because it happens to be an old saying that a stallion keeper has an easy time, does not make it so. There is considerable work connected with the breeding business, and if an individual should be troubled with this new disease called "loafer-eat-us." he can never expect to get his full share of the business; neither should he deserve the best respect of his patrons. The individual who succeeds best tries to give value received; he sows well by preparing his stallion and his barn well, and he proves the truth of that old proverb, "As ye sow, so shall ye reap."

Editor's Note:—In response to a number of requests from breeders, who did not keep files of the Stallion and Jack News and American Breeder, we are reprinting this timely article from the columns of a former issue.

Our systems of renting land are faulty and result in soil robbing; where the renter cannot provide domestic animals, the owner should arrange to furnish them so that rotation of crops may be had, and hay and grains may be fed on the farm.—From the 1911 report of the United States Secretary of Agriculture.

THE AMERICAN BREEDER

With which is combined
THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE
Editors.

Published semi-monthly (on the 5th and 20th of each month) by the
GRAHAM PUBLISHING COMPANY,
INCORPORATED.
225 WEST TWELFTH STREET.
Kansas City, Mo.
BELL TELEPHONE, 4297 GRAND.

All communications for this paper should be addressed to the American Breeder, or the Graham Publishing Company, and not to individuals.

Advertising space for a single issue, $2.80 for an inch or less. For larger space or longer time, rates furnished on application.

Subscription Rates.

To all points in the United States and Mexico, per annum, 50c; 3 years, $1, payable in advance.

To all points in Canada, per annum, in advance, 75c.

To all foreign points (in the International Postal Union), per annum, in advance (6 francs, 5 shillings), or $1.15.

When sending subscriptions, please state whether they are renewals or new ones. Always renew under the same name and initials as previously used, and at least two weeks before your present subscription expires, so that you will not miss any number. When changing your postoffice address, state the old address as well as the new one.

Watch the wrappers on your paper. The month before your subscription expires they are stamped "your subscription expires with next issue," and on the following edition is stamped "your subscription expires with this issue." When the time for which the AMERICAN BREEDER is ordered has expired, it is always discontinued.

If you miss your paper please notify us at once and all lost copies will be replaced.

Entered as second class matter, November 23, 1911, at the postoffice at Kansas City, Mo., under the act of March 3, 1879.

Copyright, 1912, by the Graham Publishing Co.

All persons are warned not to reprint any part of this paper during 1912, without giving full credit for the same to the American Breeder, Kansas City, Mo.

BETTER SERVICE FOR HORSEMEN

It is not our intention to make this an exclusive beef cattle paper. The last issue was a beef cattle edition, as was announced in the issue before. A little later we will print a hog edition, and continue a department for cattle and hogs, but the principal part of this publication will be devoted to horse breeding subjects.

Most all live stock breeders are interested in horse subjects, and with departments giving information on special breeds of live stock, or special breeding subjects that can not be obtained elsewhere, much can be done for cattle and hog breeders. Having two papers a month and of increased size, we have more space than formerly for horse breeders and can be of much more service.

Every horse breeder should be interested in getting breeders of other live stock to read more about horse breeding. Their business could be greatly improved if this were done. Cattle breeders especially will soon be as much interested in modern breeding subjects as are the horsemen of today. Mares and cows are very similar in some respects. By having a cattle and hog department and a column or two for poultry we will make our columns more interesting to mare owners. We want the stallion and jack owners to co-operate more with their mare owners. Their interests are identical, and if they work in harmony in every way much better results can be accomplished. Those who have the last issue, which contained much valuable beef cattle information, will realize what they miss when they do not get a regular issue like the old fashioned Stallion and Jack News, but there will not be very many like the last issue. We want every issue of the American Breeder to be interesting to horse breeders.

VETERINARIAN WANTED?

If any of our readers think a veterinarian is needed in their locality they should take the matter up with those in that vicinity and see if the location would afford a prosperous living for a graduate veterinarian. Just because there is no veterinarian at some little town is no evidence that it would be a good location, and there would be no use of trying to get a good veterinarian to locate there. But if there is a good big surrounding country without a veterinarian within a reasonable distance a veterinarian could build up a sufficient practice to remain in that locality. There will be several hundred veterinarians graduated this spring from colleges recognized by the United States Bureau of Animal Industry. We would like to be of service to these young men wherever it is right and proper. They have spent from three to five years of hard work in learning this profession, and with experience will make valuable men in any locality, as a rule. If any of our readers are sure they know of a good location for a veterinary and will send us a petition signed by twenty good, substantial farmers stating that they need a veterinary and will do all they can to get a veterinary started, we will present these petitions to young men who are looking for locations.

"BEST IMPORTED HORSES FOR $1,000."

I see in your last issue an advertisement of special editions to mare owners. I have three stallions and would like to send owners some papers, but think that by them seeing the advertisements that say they are selling the best imported stallions for $1,000, or home bred for $500, which is false when you go to look at the stallions, I am afraid the mare owners will take these advertisements as they read, and not find out the truth of them. I believe the mare owners would think the stallion owners who had good stallions that cost three or four times as much as the advertisers say they are selling them for, and falsely, that we stand our horses too high. I am just starting in the horse business and have had an extra good year, so don't want to have my customers dissatisfied by others advertising falsely.—Bert Herriott, Champaign county, Illinois.

[You have not read the advertisements in the American Breeder or the Stallion and Jack News. This paper does not print advertisements which claim to sell best imported horses for $1,000 each. We ask you to look closely at the advertisements in this paper. The best imported stallions have been selling for $10,000 each.—Ed.]

SCIENTIFIC MATING AND THE STANDARD BRED.

Two of the greatest lessons in mating animals can be derived from the Thoroughbred and the Standard bred breeds of horses. Speed is the real requirement in both of these recognized breeds. The watch in the hands of competent men has recorded the exact performances.

There is, however, a difference in the recording of time of these two breeds. Distance and weight required vary a great deal among running horses, but the standard bred horses are required to go two or more heats of the regulation mile, which establishes one particular aim. No other breed of live stock has ever accomplished such great results in scientific mating as has been accomplished during the last quarter of a century with the American trotting horses. These absolute records have been kept and tabulated for many generations, giving the exact performances establishing such records.

The advanced registry of dairy cattle has been carried on for a dozen years, and has a similar great educational value among dairy breeders, but there are no established records shown by any other live stock association which equal, as a test, those of Standard bred horses. Perhaps the most scientific series of articles ever prepared pointing to object lessons in scientific mating in animal husbandry are prepared by Henry Ten Eyck White, for this paper. He has given tables without number showing the results from different sires, brood mares, ages and blood lines. Mr. White is one of the best writers on harness horse production in the country.

RESULTS FROM AN ARTICLE.

To the American Breeder: I subscribed for the American Breeder for the benefit of the article on barrenness in mares, and used the remedy offered—the iodine solution. I had the veterinary do the work. It cost me $1.50 for one treatment, and my mare was settled at the second service after the treatment. It might not work in all cases. My mare is in the prime of breeding age, but failed to settle two years straight.

I noted a photograph in a number of the News of a mare with a mule colt and a horse colt. This same thing happened in my neighborhood. The mare was bred to a stallion and three weeks later returned in heat and was bred to a jack. The following spring she foaled a dead horse colt, then a month later foaled a mule colt, which is normal every way but slightly undersized.

In last month the suggestion was made that half the season fee should be demanded by the stallioner in order to shut the barren mares out. That plan will not work well. It is the plan used by a stallioner in a near-by town once, and while it does keep some few cases of long standing out, the mare owner feels at liberty to return the mare as often as he pleases and as long. Why not all owners and keepers co-operate and compel each mare to be examined by a veterinarian and a certificate issued? This would be a protection to both mare owner and stallioner. Any man who owns a mare worth breeding would be willing to spend a dollar for her protection.—H. C. McClure, Greene county, Illinois.

CITY WORK HORSE CONDITIONS.

Every large city in the country is having campaigns aiming at better treatment of work horses. An organization of Chicago people is seeking to insure better feeding and stabling of the thousands of work animals in the city. New York city has its workers for better street conditions in the winter and other reforms for the better; Kansas City's humane society is unusually active, and Boston, the home of humane organizations, is doing greater work than ever before towards bettering horse conditions.

One New Yorker is endeavoring to secure the sprinkling of streets with ashes or sand in the winter when they are slippery. In Kansas City the humane society distributed leaflets to the small horse owners telling them of the best feeds for their animals and of their proper care. Following Christmas day this organization distributed hundreds of pounds of oats to the very poor owners of poor horses for a Christmas "dinner."

What horse producer in the land dos not occasionally ask himself, "I wonder what becomes of the horses that I raise on my farm and sell to a country buyer?" Breeders know well of the unnatural lives that thousands of fine draft horses, expressers, chunks and even pleasure animals must bear in cities. They know, many of them at least, that the user of good draft horses finds the average working life of the animals he buys is but five years, while it ought to be about fifteen years. Hard pavements and other unnatural conditions are responsible for this.

Correct feeding, blanketing at the proper time, hygienic stabling, kindness and elimination of overwork are some of the things that can be done to improve city work horse conditions. These are aims of many organizations in many cities. These organizations are unusually active, but some credit for this is due the horse owners themselves, as they are cooperating in many instances with the civic workers. The increased cost of horses, and the possibility of lengthening the period of usefulness are some of the influences that are bringing this co-operation about. Producers will be glad to hear of this situation because their contact with animals and experience in raising them brings in them a humane feeling, and also because it will increase the value put on horses by city workers. This increased valuation will be brought about by the lengthening of the usefulness of the horses on the streets, thereby making the money spent for them yield greater returns.

GENERATIVE ORGANS OF THE MARE.

To the American Breeder:—All mare owners should have a knowledge of the anatomy of the generative organs of the mare. As this knowledge usually cannot be acquired without spending time and money, many neglect it, and I will write for their benefit a description of these sensitive organs.

First, are the right and left ovaries, similar to the testicles in the male, but of smaller size, and attached by ligaments in the abdominal cavity, a little behind the kidneys. Next is the uterus or womb, a muscular organ lined by a mucous members, and placed between the rectum above and the bladder and intestines below. It is made up of two horns, with the ovaries on the end, a body in which the fetus grows, and a neck of round and hard tissue closing and separating this part from the next, into which it projects in the virgin animal. The vagina which is the chief organ in contact with the stud is composed of muscle and membrane, internally. The opening of the bladder is on the floor of this space, about three inches in from the external lips. The vulva or lips complete, externally, the organs of the urinary and generative systems. The clitoris, which can be seen just within the lips of the floor of the vagina is of spongy tissue similar to the male penis, and undergoes erection when sexually excited.

In the mare there are two glands placed side by side between the thighs, whose office is to secrete milk for the nourishment of the young. Their structure is composed of innumerable cells, capable of secreting the milky fluid, which is carried by canals to a central space in the gland or teat, where it may be retained a short time, without inconvenience, passing by a number of small canals to the free end of the teat (the nipple) and it is there freed.

Thousands of dollars are lost annually by mare owners not making a closer study of the generative organs of the mare and of the causes of sterility, for fifty per cent of which the mare owner is to blame. They are also often deplorably ignorant of the care of new born colts. A little study would increase their profit.

All stallion owners should be capable of instructing their patrons in the care of the mare, and new born colts, and also to cure the majority of sterile cases. Such a man will get custom. J. V. Kelly, Bayfield County, Wisconsin.

QUESTIONS AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, makin git safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

OBSTINATE WOUND—I have a broncho mare that has a sore on top of her backbone, between the hips. It is running pus all the time and I can't get it healed up. The mare has been running on the range all summer, never had a halter on. I noticed the sore about the middle of October, but never done anything with it until December 1. Have tried blue vitrol on it. Please let me know what to do for it?—North Dakota Subscriber.

REPLY—Wounds on this part of the body are frequently difficult to heal. First, for the reason that it is difficult to secure proper drainage. And second, the ligaments along the top of the spines of the backbone are often involved in the disease. The most satisfactory way to treat these conditions is to carefully remove all the diseased tissue with a knife and curette and touch the wound with tincture of iodine. The iodine treatment may be continued every other day for four or five applications and then the wound may be dusted daily with iodoform and boracic acid equal parts. Blue vitrol is not suitable for wounds of this nature.

RUNNING HORSE SHOES—I wish to get horse shoes for running horses that are thick enough to keep the frog of the foot from coming in contact with the hard track, yet as light as the ordinary steel plate for running horses. I have been told that there are shoes made containing aluminum that will stand the ordinary wear of training.—North Dakota Subscriber.

REPLY—Steel shoes will give better service than lighter shoes, if you expect to work the horse on frozen ground. The aluminum shoes have been used by some trainers, but many of the successful turfmen advocate the using of the regulation weight during training and racing alike, that is, they claim that a horse gets familiar with a particular weight of shoes, which is better than to be changing weights and types.

SEVERE INJURY—I have a five-year-old gelding that I ploughed last fall until late. When I quit I took the shoes off of him and turned him out. I was away three days, when I returned I found him lame in his left hind leg. He would place it on the ground, but when he placed his weight on it he would groan aloud with pain. In taking him to the barn a distance of a quarter of a mile, he lay down once and was wet with perspiration. That was the first of November. I examined him as close as I could and it seemed to be in the stifle joint. I rubbed it with Sloans Liniment, but it did not do any good as I could tell. I have had him in the barn ever since. I turn him out in the lot, sometimes he will run and play and never limps except the first in the morning, or when he is turning toward the lame leg, or a steep or sidling place. Could he have been stifled? Can he be cured of the lameness and how? He is a fine 1,400 pound horse, of a fine disposition and good worker, but is ruined for the market unless cured.—Montana Subscriber.

REPLY—Your description does not enable us to venture an opinion as to cause or location of your horse's lameness, but we would judge that the injury has been a severe one and that the animal is making satisfactory progress toward recovery. We would suggest that you give this animal a still longer period of rest by permitting him to exercise in the lot mentioned. Do not be in any hurry to hitch him up as he will very likely get over the lameness entirely by giving him more time. Should you favor the opportunity to do so have a good veterinarian make a careful examination of the affected limb as he can no doubt hurry up the matters by making proper applications to the affected parts. He was not stifled as that term is usually understood.

PERCHERON HORSES—I am wanting to get some instructions about the Percheron horses. If there is a history in book form or pamphlet or a paper published devoted to the interest of these horses, I would be very grateful to know how to get hold of any of these. Our people are ignorant about this horse but having seen a few up North I would like to get hold of some way of educating ourselves more fully about them.—Texas Subscriber.

REPLY—We would suggest that you write to Wayne Dinsmore, secretary of the Percheron Society of America, Union Stock Yards, Chicago, Ill. He has recently prepared some up-to-date literature on this subject.

BOILED FEED FOR STALLIONS—Is boiled oats and some flax good feed for a stallion to be stood for mares next spring?—North Dakota Subscriber.

REPLY—It is not necessary to boil the feed for your horse, if his teeth are good. It is perhaps better to feed him dry oats without any dust or must. When one starts to boil the feed or use wet feed, it encourages a habit which the digestive tract will require. If the oats are fed dry the stomach will become accustomed to that kind of feed, and there should be very little danger of intestinal derangements, but if the feed is boiled for a considerable length of time, and then changed to dry feed, bad results are liable to follow. Good, plain horse feed, fed regularly, is better for your stallion than boiling or doctoring. A little flax, fed occasionally, might not be injurious, but the quantity should be very small.

WHEN TO CASTRATE—When would it be the best time to castrate a five year old stallion?—Kansas Subscriber.

REPLY—Just as soon as the weather gets a little warmer, and before flies come.

F. E. Knowles, Wellington, Kas., one of our regular advertisers, reports the sale of the Standard bred 3-year-old stallion, Russell Yetter, to H. H. Foulders of the Farmers' State Bank of Wellington. This is a high class horse, as are the others Mr. Knowles is offering for sale.

Clip Your Horses In the Spring

In the spring when your horses are soft and you put them at the hard spring work they sweat a great deal. Their heavy winter coat holds this sweat and it dries out slowly. If left to stand they take cold easily and at night they chill and are liable to all kinds of complaints. If you clip them they dry off fast and there is no question but they stand much less chance of taking cold when dry than if wet. You would not like to stand on a raw spring day or on a chilly spring night with a heavy wet suit on. Neither do your horses. It pays to clip them and blanket, if necessary on cold nights. Your horses dry off much faster, they feel better, rest better, get more good out of their food and do better work. They are better all around. Is it the humane and profitable thing to do. The quickest, least expensive and most satisfactory way to clip is with

The Great Stewart Ball Bearing Clipping Machine

The price, all complete ready for work is only. . . . $7.50 This machine is guaranteed for 25 years and is solid machine. They are and protected safe from dust and dirt and they run in an oil bath.

Friction and wear are practically done away with. It has 6 feet of high grade flexible shaft and the famous Stewart cutting ping knife ever made. Price of the complete machine one from your dealer or send $2 and we will ship you a

Healthy Demand For Horses

Lively Market Opening Two Weeks Ago Followed by Steady Demand. Cattle Made A February Record for Price on Beeves Lacking both Finish and Scale.

THE market for horses and mules seems to be on a fairly firm basis. Two weeks ago there was a lively opening up in the demand and prices were moved up $5, $10 to $15 a head, and in a way the market was rather unsettled, with prices very uneven. In the past two weeks the prices have shown some settling as compared with the tops referred to.

Demand is strong and coming from a wide area. The east is caring for a liberal supply of good heavy drafters and chunks, and while quality is one of the requirements of that outlet, good flesh is a big inducement if the quality is not up to the top notch. Southern demand cared for more horses and mules in the past two weeks than in any previous similar period this year. The cropping season down there is at hand, and from now until about the middle of June that outlet will be broad.

Some mules and many heavy horses have gone to the west and northwest for construction work, and that outlet should broaden as the winter season closes. In most cases heavy mules are required. Inquiry for farm horses is being received, but as yet the actual trading has been of small proportions. The next two weeks will see a broader outlet from this source. Receipts of both horses and mules have been liberal, and with the exception of a big run of pluggy stuff, all the offerings sold readily, orders during the early market days keeping the pens fairly clear of stuff that will class so that on auction days the offerings are fresh. Of course sound horses four to seven years old and well broken are the kinds that have the call. Off colors, blemished, winded or greenish kinds are discriminated against .

Prevailing prices for serviceably sound horses and mules, four to seven years old, are as follows:

Drafters, 1-700-pound up	$165@250
Drafters, fair to good	140@165
Chunks, good	125@155
Chunks, fair	95@135
Southerners, good to choice	125@150
Southerners.	75@125
Driving horses.	65 up

Choice Cattle Lacking here.

Moderate receipts and a stronger tendency to prices has been the feature of the cattle market in the past two weeks. On several days the supply was pretty much bunched in Chicago although at river markets receipts have shown more evenness, and prices have shown less fluctuations. February 7 prices reached the high level of the year, and since then fell back moderately, but the average for the two weeks was easily the highest this year. In Chicago prime steers sold up to $9, and while nothing prime was offered here, some steers fed 100 to 120 days brought $8 to $8.15. The highest previous price for any February was $7.50, and the previous record was paid for steers that showed strictly prime finish. Both quality and numbers indicate that mosts of the fed steers are in Chicago territory, while to the westward from Kansas City few cattle are on feed. The scarcity of good steers is pronounced. There is a range of more than $3 a hundred pounds in prices and a prime bunch would increase the range to more than $4. The bulk of the steers coming now are selling at $6 to $7.50. They have been fed in various ways and the prevailing length of time for feeding has been forty to sixty days. In every way the feeder has economized on the feed bill, and this, together with the unfavorable weather for feeding, has made the average quality of the steers marketed far short of former years. While weight is at a decided premium, there are practically no finished steers either in light or heavy weights.

In Kansas City 36,000 fewer cattle were received the first six weeks this year than in the same period last year. Chicago, St. Louis and Omaha also show decreases.

Quarantine Cattle Help Supply.

Feeding below the quarantine line, which a few years ago was an innovation, is one of the principal sources of supply this year, and were it not for the cottonseed meal and cake fed steers there would be some mighty short picking for the packers. Good steers from below the quarantine line sold up to $6.45, and most of them are bringing $5.75. A few Arkansas steers and Oklahoma steers that have had no feed are selling as low as $4.25. Conditions below the line are said to be favorable for both crops and cattle this year and the raising of stock of all kinds is said to be on the increase. Far less discrimination is made against these southern cattle than a few years ago.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$7.90@8.40
Good to choice steers	7.35@7.85
Fair to good steers	6.35@7.30
Common to fair steers	5.15@6.30
Meal fed, choice	6.35@6.85
Meal fed, common to fair	5.25@6.30

Cows and heifers which were once a source of low priced beef are very scarce. Packers do not try to disguise the fact that they need more than they are getting, but up to the present time the high prices have operated as a check on the demand. On the other hand, farmers are taking this period to dispose of the stuff they don't want. Few heifers have been good enough to sell above $6, though some cows brought that level. High prices at present restrict the demand from the small butchers throughout the country, but any tendency toward a break would bring renewed demand from them.

The following quotations are for the various grades of butcher cattle:

Choice.	$5.35@6.00
Fair to good	4.50@5.30
Common to good	3.50@4.45
Canners.	2.60@3.40
Heifers—	
Choice.	$6.50@7.00
Good to choice	5.85@6.45
Plain to fair	4.85@5.80
Common.	3.85@4.50
Veal calves.	4.00@7.50
Bulls.	3.50@5.75

The following quotations are for stock and feeding cattle:

Selected feeders	$6.00@6.35
Good to choice feeders	5.50@5.95
Plain to fair feeders	5.00@5.45
Selected stockers	5.75@6.25
Good to choice stockers	5.25@5.70
Plain to fair stockers	4.50@5.20
Stock calves.	4.00@5.85
Stock cows.	3.50@4.50
Stock heifers.	3.75@5.25
Milch cows	35.00@85.00

Hog Market in a Rut.

The hog market is in a rut, but indications that it may lead up a hill came recently when receipts for the first time in more than a year past fell short of the supply in the corresponding time a year ago.

Following are hog quotations:

Choice, 250@300 lbs.	$6.20@6.30
Choice, 200@245 lbs.	6.05@6.27½
Medium weight.	5.90@6.22½
Light weight.	5.50@6.05
Common to fair	5.00@5.65
Stags.	4.50@6.15
Boars.	3.75@5.65
Bulk of sales	3.90@6.25

The following table shows receipts of live stock in Kansas City less for this year, compared with the same period in 1911:

	1912	1911	Inc.	Dec.
Cattle.	189,465	224,854	.....	35,391
Calves.	10,833	20,605	.....	9,772
Hogs.	441,822	319,526	122,296	.....
Sheep.	258,668	245,639	13,029	.....

WHAT CONSTITUTE HORSE VALUES.

(Continued from page 6.)

BREED. — The breed to which a horse belongs has but little influence upon his market value as long as he has individual excellence; possessing this he will always find ready sale at a good price. Some buyers, however, discriminate against certain breeds, claiming that they are more subject to ills and lack of stamina; but this is likely to be due to individuality more often than to breed. If a horse belongs to the draft or chunk class (Southern chunks excepted) he is the more appreciated by buyers is he shows evidence of a predominance of draft blood.

GENERAL APPEARANCE. — The general appearance of horses has much to do with their market value. If able to shape themselves well in harness, very plain horses often make a stylish showing and enhance their value materially. They should be spirited and energetic, which generally comes from being well fed. They should be well groomed, the hair short and sleek, lying close to the body and possessing a lustre which is indicative of thrift. Clipping of the foretops and limbs should not be practiced, as it is an indication of staleness or second hand horses. The presence of the foretop and feather leaves no doubt as to the freshness from the country. An exporter remarked to the writer that for foreign trade it depreciated a horse $25 or more to remove the foretop. The pulling of the mane and docking of the tail should not be practiced, as this is the business of the dealer who caters to a certain class of trade. The feet should be in good condition, solid and of good length hoof, which is necessary to hold a shoe. It must be perfectly evident that if a dealer retains a horse until he grows good feet before being consigned to the market, he must be bought correspondingly cheap to recover this loss.

To illustrate this article the cuts appearing on this and following pages were especially prepared. They are from recent photographs taken at the Kansas City stockyards, showing horses just as they run in an average day's offering. No special effort was made to obtain perfect specimens, but rather the average. The horses were mostly gaunt from shipping. The prices shown were agreed upon in consultation with men who are on the market as fairly representative for this time and place.—Editor.

PLAIN FARM MARE; 1,300 POUNDS; VALUE, $140.

Raymond H. West, in sending the advertising of Frank S. West & Son of Woodriver, Neb., writes that the Percheron and Belgian mares mentioned in their advertisement are about the best lot they have ever had. In weighing these mares they found that the largest team weighed 2,220 pounds, both mares being heavy in foal, in good flesh and sound. He says the lightest stallion weighs 1,850 pounds and is coming three years old. All the stallions have been submitted to the Nebraska Registration Board for inspection and have been passed.

CLYDESDALES

Of excellent quality a specialty. Both imported, and our own raising, from imported stock. The largest selection of registered stock in the West. ¶ Send for our booklet giving photographs and descriptions,

John Leitch

Lafayette, Stark County, Illinois

GALBRAITH'S CLYDESDALES

Famous the world over for three-quarters of a century. Present stock the best we ever had. No tail ends. Every horse we have is a show horse.

More international prize winning stallions over three years old for sale in our stud than all competitors combined.

Remember the Clydesdale is the coming popular breed and has won 80 per cent of all leading prizes in competition with the best of every other draft breed at Chicago.

ALEX GALBRAITH & SON, DeKalb, DeKalb County, Illinois.

CLYDESDALES

Registered Clydesdale Horses and mares; some of them closely related to the famous "Baron of Buchlyvie," who sold in Scotland recently for $47,500. For further information apply to **John Sparrowhawk, Wakefield, Clay Co., Kan.**

Royal Belgians

Imported and home-bred stallions and mares; first and second prize winners at Hutchison State Fair; from the best known strains; for sale at "live and let live" prices. Every horse guaranteed as represented. For particulars, write, or better, come and see. **David Cooper & Sons, Freeport, Harper County, Kansas.**

SIX STALLIONS

Clydesdales, and a Morgan. All of breeding age and of the best breeding. All broke to harness and used on the farm. All have won prizes at county and state fairs. Those that have been tried are extra good breeders. Prices very reasonable. Correspondence solicited. **Painter Bros., Middletown, Henry County, Indiana.**

Extra good imported and home bred **Draft and Coach Stallions** from $800 to $1,400, 2 to 5 years old, including many state fair prize-winners; recorded in U. S. approved books (not recorded grades) and fully warranted. Also **mares and jacks.**
WALKER BROS., Oklahoma City, Okla.

BELGIAN STALLION AND MARES.

One Belgian stallion, dark brown, with star, four black feet; 5 years old. Has been inspected and marked sound and register papers O. K. Weight 1750, could be made to weigh 1800 or better. A sure foal getter, good colts to show. Good style and action. Also a few mares in foal to him. Some young stuff and three mules, coming 4 years old this summer. Will sell reasonable. Phone number 20, Line 210. **J. M. Cuplin, Ainsworth, Brown County, Nebraska.**

PERCHERONS, STANDARD AND JACKS.

Two Percheron stallions, black, 5 and 6 years old; 1,950 and 2,200. Sound and registered. Hobson took first in the open class with 5 importers in the ring, and 1st in the American bred class at the Nebraska State Fair, 1909. He is a heavy boned, square framed horse and weighs 2,200 lbs. Tricon is 6 years old. Was my choice out of a herd of 200 head of the best stallions I ever saw together. Also Bud Mason 42689, standard and registered, by Penrose 4912. Bud scores 98, or 2 points less than perfect. Will sell or trade for saddle stallion. Also 4 jacks from 15 to 15¾ hands, Standard; as good as grow. All registered and fine performers. All of this fine stock is for sale, as I have just turned into my 72d year and can't handle them and will close them out right. **Wm. H. Patterson, Mound City, Holt County, Mo.**

BELGIANS

Stallions and mares, over 100 head, Jan. 1, 1912. 24th year in business. Write for catalog. **Henry Lefebure, Fairfax, Linn County, Iowa;** 8 miles west of Cedar Rapids.

PERCHERONS FOR SALE

We are offering an extra choice lot of stallions from 2 to 6 years old. They are the large drafty fellows that the farmers like and the kind the market demands. All stallions recorded, and sold under a written guarantee. Will price them where they will sell and on terms to suit. **Slingmaster & Walker, Union Stock Yards, South Omaha, Douglas County, Nebraska.**

PERCHERON AND FRENCH DRAFT STALLIONS AND MARES. All Blacks.

Consisting of 4 stallions, ranging in age from weanlings to 6 years old. All blacks; all sound, and well matured, near a ton.

Also have a nice pair of black mares 3 and 4 years old, in foal. Also one black 6-year-old mare. This stock is of my own breeding. Is all recorded and priced to sell at farmers' prices. Come and see them.
Ben Martin, Garden City, Cass Co., Mo.

EXTRA GOOD PERCHERONS.

If you want an extra good home bred or imported Percheron stallion or mare, selected and imported by myself, running in weight from 1850 to 2400 lbs., and prices as low as the lowest. Come and see me. I defy competition. This stuff must be moved at once to make room for my next importation.

Also two standard bred trotters, 3 and 4 years old. One by old Baron Wilkes, the other by Expedition; both out of Nannie Dillon by Baron Dillon, by old Baron Wilkes.
S. J. Miller, Kirksville, Adair Co., Mo.

IMPORTED PERCHERONS AND BELGIANS

Stallions from 3 to 4 years old. All acclimated and sure foal getters. All work single. Run in color, black, gray, sorrel and bay; good action, bone and all of first class conformation; weigh from 1,800 to 2,300, honest weight, with reliable pedigrees. All imported by us and a few are European prize winners. **We are natives of France and we know the prices are right.** We also have a few choice mares in foal. Come and see us or write

JOS. ROUSSELLE & SON, Seward, Seward County, Nebraska.
25 miles west of Lincoln, farm ½ mile north of Court House.

REGISTERED MORGAN HORSES

JOSEPH M. NOLAN'S PUBLIC SALE

50 REGISTERED PERCHERONS 50

Will be held at PAOLA, KANSAS

ON

TUESDAY, MARCH 12, 1912

in John Williamson's Sale Pavilion, commencing promptly at 1 o'clock p. m., rain or shine. This consignment consists of the following:

20 REGISTERED PERCHERON MARES

from 3 to 6 years old. These mares are of suitable age and safe in foal.

10 REGISTERED FILLIES, FROM 1 TO 2 YEARS OLD
20 STALLIONS FROM 2 TO 6 YEARS OLD

All the above horses will be sold under a guarantee. Time will be given on bankable paper. Parties desiring time should bring bank references.

Paola is situated 45 miles southwest of Kansas City, on the following railroads: St. Louis & San Francisco, Missouri Pacific, and Missouri, Kansas & Texas.

For catalog address

JOSEPH M. NOLAN, Paola, Kansas

There will be some horses in this sale consigned by two other breeders.
Col. Al. Hudson, Auctioneer.

RECEIVER'S SALE

60 Percheron, Shire, Belgian, Coach, Hackney, Standard Bred, Saddle Bred, Stallions and Jacks.

This is a choice lot of stallions, 2 to 6 years old, a fine lot of sound jacks, 3 to 8 years old, 14 to 16 hands.

120 acres of land in Elk county, Kansas; improvements, house and barn. 80 acres in Randolph county, Indiana; improvements, house and barn.

The court has ordered the above sold and everything must be sold inside of 30 days for the low dollar. If you want a first class stallion for less than half value now is your chance, as they must sell at once.

Lew W. Cochran, Receiver for Bridges & Flora, Crawfordsville, Montgomery County, Indiana.

PERCHERON AND BELGIAN STALLIONS AND MARES.

Our horses are all good clean sound fellows, with plenty of bone. Our ton horses weigh 2000 pounds.

A Stallions have been passed on by the Stallion Registration Board of Nebraska, and all pedigrees have been passed by the Department of Agriculture at Washington, D. C.

We have five mares that average 2100 lbs. One team that weighs 4440 and all of them are sound.

Come to our barns and see some of the best horses in the United States.

FRANK S. WEST & SON

THE SQUARE DEAL HORSEMAN

Wood River, Neb., and Hamilton City, Cal.

RHEA BROS. PERCHERONS

We exhibited fourteen Percherons at the late Nebraska State Fair and won 17 prizes, as follows: One silver medal, one championship, seven firsts, two seconds, three thirds and three fourths. Now, remember that we showed our home bred horses in the same classes with the imported stallions and won First every time, bar one. So much for the show. The important thing to be considered is "how does the whole lot show up?" and that is exactly where we are strong. Our two-year-olds, some of them still in the pasture, weigh from 1,600 pounds to 1,900 pounds. These weights guaranteed.

We always claimed to have the big boned kind, and this season we are sure we have better bone than ever, cleaner joints and better feet.

Don't lose sight of how we raise these colts, in the pastures winter and summer, until coming three-year-olds. That's why they are hardy and prove breeders from the start.

Our horses are acclimated, its importance cannot be over estimated. We have stallions coming two, three, four and a few older ones for sale at prices that are very reasonable. Every stallion sold under a full guarantee; can furnish life insurance for two-thirds value at cost.

Write for pictures, descriptions, prices and any information you may want.

Arlington is on the main line of the C. & N. W.R. R. 28 miles northwest of Omaha, 8 miles east of Fremont and 55 miles north of Lincoln. Twelve passenger trains daily.

Arlington, Nebr.

Highland View Stock Farm.

100 Percheron Stallions and Mares.

Our last importation June, 1911, Prices are right, terms to suit. Write or come to see us and learn our method of doing business.

O. N. WILSON, Proprietor, - Kittanning, Penn.

Dr. W. H. Richards

IMPORTER OF

Belgians and Percherons

A fine importation arrived Sept. 10, 1911. I have selected them personally, and have the pick of Belgium and France's 2 and 3-year-olds. All were selected for good breeding, soundness, bone and individuality. All good colors and will make ton horses. Every horse absolutely guaranteed. Any one looking for a first class STALLION at very REASONABLE price should come and see them before buying. Barns four blocks from Santa Fe depot, Emporia, Lyon Co., Kas.

L. M. MONSEES & SONS'

VALUES IN STANDARD BRED HORSES

Governor Folk 01104; a handsome dark bay stallion; 8 years old; 15¾ hands high. Weighs 1,100 lbs. Well bred and a sure breeder. Kind disposition. Sold for no faults.

Knightingale; 3 4-year-old bay mare, 16 hands high; weighs about 1,200; bred to Platum, 41043. Been drove some single. Is a pacer and a good prospect for a race or brood mare.

The above are all Standard and registered. Sound. For sale cheap. Could use a good draft or saddle stallion.

F. E. Knowles, Wellington, Sumner County, Kansas.

This will not appear again.

Registered Black Hawk Morgan

Stallions and mares for sale at the Old Homestead Farm.

Pierpont, Ashtabula County, Ohio.

OUR HARNESS HORSE TALK.

(Continued from page 6.)

"trimmed" at 3. It has been so in recent years with Trampfast and Native Belle, and Princess Todd will find the game harder next summer than last. She is a compactly made little filly and probably was about as good as a 2-year-old as she ever will be, while some of the lanky ones of her age will develop in their third year into rugged colts ready to beat 2:10 all the time, just as Colorado E. did when he was that age. When he was right that summer Native Belle, which handled him with ease when both were 2-year-olds, was not in his class. Miss Stokes came nearer filling the bill both as a 2 and a 3-year-old than any other of the high class ones of those ages.

C. N. Moore of Lee's Summit, Mo., is moving to New Mexico, April 1, and offers for sale his mammoth black jack, that has made three seasons and never sired a bad mule. Also a registered French Percheron stallion, and a 3-year-old Percheron stallion, and Russ Squirrel, the famous sire of saddle and harness colts. Mr. Moore says he will sell these at a bargain if sold soon. Read his advertisement in this issue and write him.

SADDLE HORSES

Of the most fashionable Chief breeding; yearlings and two-year-olds. Two mares in foal at a bargain. **J. A. Tuttle, DeSoto, Jefferson Co., Mo.**

Saddlers For Sale

At private contract, I offer for sale the most fashionable strains and superb individuals in stallions and mares and fillies, by such sires as Rex McDonald 833; Rex Monroe 2063; Star McDonald 2526, and Fos McDonald 3096. All bred and developed by me. **H. A. Greenwell, Lakenan, Monroe County, Missouri.**

SADDLE STALLION AND MAMMOTH JACK.

Horse is dark bay, 15¾ hands high, 9 years old, sired by King Herod 216½. Jack is 8 years old; black with white points, heavy bone, heavy body. Both are good in every respect. Colts to show. **E. E. Stoner, Mendon, Chariton County, Missouri.**

JACK FOR SALE.

Have two jacks. Want to sell one 5-year-old, sure breeder. Can show colts; 58 inches high; girt 62 inches; color mouse. Price $200. **John M. Mischke, Crofton, Knox County, Neb. Route 3.**

MR. JACK BUYER.

Do you want to save one fourth on purchase price of a jack? If so, come and see me.

We have 20 big black Mammoth Jacks ready for service; 3 to 6 years old. Also 20 Stallions, Saddlers, Trotters, Drafts. The right kind. We have the goods and they are priced cheap. **Milton Gustin, Edgerton, Platte County, Missouri.**

We do not advertise 20 and have two.

Bargains For Quick Buyers.

PERCHERON AND SADDLE STALLIONS AND JACK

Will move to New Mexico about April 1, having sold my farm here. 1 Mammoth black jack, 15½ hands Standard, heavy bone and body, typical head and ear. Sure breeder and quick server, 6 years old. Made three seasons and never sired a bad mule.

1 registered French Percheron stallion, dapple gray, 16½ hands, weight 1,850 lbs. Splendid and sure breeder. Good disposition, absolutely sound—a big bargain.

1 three-year-old pure bred Percheron stallion, dark brown, extra good body and bone. Well broke to service, worth twice the price we ask.

"Rus Squirrel," the best sire of saddlers and harness colts in the country. Will show the colts and the horse. This horse will make the price we are asking for him in one season. Come and see this stock or write,

If this stock is not sold at once, it goes in my big sale at the farm March 8.

C. N. MOORE, Lee's Summit, Jackson County, Missouri.

KENTUCKY AND MISSOURI BRED JACKS.

They are of the best blood and extra heavy boned. The best I ever owned in 25 years in the jack business. So come and see. Some are good ones.

J. E. Park, Cameron, Clinton Co., Mo.

Two Registered Jacks

Coming 2 and 3 years old. Good ones of my own raising. Cheaper than dealers or large breeders will sell.

J. W. Stormont, Dighton, Lane Co., Ks.

20 Black Jacks For Sale 20

Twenty big black jacks, with white points, for sale. Ten, from three to seven years old; five, coming two years old. They have lots of size, bone, quality and style. Write for catalogue. We also have 200 mare mule colts, for sale in car load lots.

SCOTT, ABNEY & JENKINS
Virden, Macoupin Co., Ills.

Five Jacks For Sale

Missouri bred jacks; extra large; two and three years old. Also four large jennets. Will price them right.

W. H. Wheeler, Garden City, Kas.

JACKS AND SADDLE STALLIONS.

100 Registered Kentucky Mammoth Jacks and Saddle Stallions. A big lot of jennets, saddle mares and geldings. A few good walking horses, pacing and trotting stallions. Also Big Black pigs, Tamworth and Hampshire swine. Cook pays the freight on jacks. **J. F. Cook & Company, Lexington, Fayette County, Ky.**

FOR SALE, No. 1 MULE JACK.

Has never been bred to jennet; one of the quickest performers I ever saw; game and lively as a trotting stallion. Has never had a jack sore on him, weighed 850 pounds at 2 years and 8 months. Is 8 years old; dark gray with mealy points; gets more black, brown and bay colts from gray mares than he does gray and never sired a gray from any other colored mare. One of his colts brought $150 at 10 months and weighed 1,475 at maturity, winning first at Texas and Oklahoma state fair. **E. Pinkston, Cedar Point, Chase Co., Kansas.**

Missouri Registered Mammoth Jacks AND JENNETS

FOR SALE AT ALL TIMES.

As fine a bunch as can be found on one farm. Guaranteed as represented. Prices right. Come and see them.

J. T. Watson, New London, Ralls County, Mo.

MAMMOTH JACKS AND PERCHERONS

STALLIONS FOR SALE—100 head of Jacks, Percherons and Standard Bred Stallions and Mares. Jacks from two to six years old, from 15 to 16 hands high. Percherons weighing from 1,600 to 2,250 pounds. And Standard bred horses of the most fashionable blood.

Also 85 head of Jerseys and Shorthorn cattle.

Write for prices and visit our farms before you buy. Farm and sale barn on 21st street, one mile east of Union Stock Yards. City office at **136 N. Market St.**

J. C. Kerr & Co., Wichita, Sedgwick County, Kansas.

AL. E. SMITH'S Stock Farm

Seventy-five registered Black Mammoth Jacks and Jennets, 15 to 16 hands standard, imported and home bred. Some good Percheron Stallions. More good big boned, high class jacks and jennets than you will find in any one barn. Forty miles west of Kansas City, Al. E. Smith, Lawrence, Douglas county, Kas. R. 1.

BIGGEST BARGAIN ON EARTH

One black jack; white points; coming 5 years old; line bred; 16 hands high. Registered No. 2007, 9 inch bone. If interested, write at once. This ad. will not appear again.

W. C. Milling, Union, Newton Co., Miss.

BLACK JACK WITH WHITE POINTS

Fifty-seven inches from center of withers to hair of hoof; 30 inch ears; 63 inch girth; 8 inch bone. Will be four years old next June. Has never been used but was raised with mares and will be no trouble to handle. Price $300. **E. Joy, Golden City, Barton County, Missouri.**

A GOOD JACK.

WALDHEIM CHIEF—Certificate No. 3218; should be in some good breeding district this spring. We are not in the business, only raise them to sell. He is well broke, without the aid of a horse; black with white points, 15¼ standard; 5 years next September. Do not miss seeing this jack before buying. **Steigleder Bros., Bunceton, Cooper County, Missouri.**

KENTUCKYJUMBO—PREMIUM JACK.

Black, white points, 2d premium as a yearling; 2d as a 2-year-old against all ages; 1st as a 3-year-old; 1st as a 4-year-old against all ages. Now 5 years old. 15¾ hands. O. K. every way. Works on mares or jennets; heavy boned; 70-inch girth and flank when fat; price, $1,500. No trades.

Smaller jack, black, would trade for draft stallion, black or bay. He is all O. K. every way. Also Chester Dare an Indian Chief saddle stallion, brown. 16 hands. Price $400; 6 years old. **P. H. Vories, Sparta, Gallatin County, Kentucky.**

7 Jacks for Sale

Two of these jacks are sons of the high; all blacks and well bred.

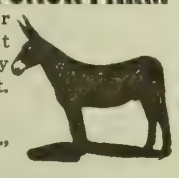
Two of these packs are sons of the $2,810 Limestone Wonder, and one is a great jennet jack. **Chas. Wyatt, Petersburg, Pike County, Indiana.**

CALLAWAY COUNTY PAGE AVENUE JACK FARM.

Callaway Jacks are the best. The best is always the cheapest. Jacks are for sale at all times. None better. Also one registered saddle stallion, 16 hands high, dark bay, fine style and goes all the gaits thoroughly, and as a producer has proven himself second to none. Will sell worth the money if sold soon. **J. R. Reynolds & Son, Guthrie, Callaway County, Missouri.**

A NUMBER ONE JACK.

Six years old; black, mealy nose. Acclimated to the north and guaranteed in every way. Weight about 1,000 lbs. **Lars Bartelson, Badger, Holt County, Nebraska.**



THREE JACKS FOR SALE.

One registered jack; 15¾ hands. Black and white points, heavy bone, good head and ear, an extra good one. One brown jack, 14¾ hands; extra heavy bone and body. Foaled August 4, 1909. Will make an extra good mule jack. One jack 8 years old, 15½ hands. Extra bood bone and body. Extra breeder, but spoilt to jennet. One jennet, 9 years old; 14½ hands. Extra heavy. **W. W. Downing, Hawk Point, Lincoln County, Missouri.**

CLOSING OUT CHEAP.

Two big black jacks; white points; herd headers. One 6 years old, 16 hands Standard, 16 inch foot, 10 inch bone, weight 1,200 pounds; colts to show. One, 2 years old, and three the 8th of August, next, 16½ hands Standard, weight 1,000 pounds, 15-inch foot at edge of hair, 9½-inch bone. Come or write **G. B. Weaver, Harrisonville, Cass County, Mo., R. 1.**

REPUBLIC COUNTY JACK FARM

Six good jacks for sale, including two that are extra good. Will pay car fare if they are not.

T. E. Collins & Son, Belleville, Republic Co., Kansas.

MAMMOTH JACKS and JENNETS

25 big black mammoth jacks and jennets. The breed that sired the World's Fair premium mules and the Grand Champion Jack of the Illinois State Fair for the past two years. All stock fully guaranteed. Prices very reasonable. **James M. Spurgeon, Williamstown, Lewis County, Missouri.**

Jacks For Sale

26 fine large Tennessee jacks; 6 months to 7 years old. Also 24 jennets bred to fine jacks. Prices right. Catalog free if you mention American Breeder. **S. W. Jetton & Co., Murfreesboro, Tenn.**

HOME OF THE GIANTS.

75 head of jacks and jennets. Won nearly half the ribbons at Sedalia in 1911. We think we have the finest herd of jacks and jennets in Missouri. We have these prize winners for sale. We handle the big black, big boned, big footed kind. **Bradley Bros., Warrensburg, Johnson County, Missouri.** 65 miles East of Kansas City, main line Missouri Pacific. Right in town.

THE KENTUCKY JACK FARM

Established 1884

BREEDER of registered, Mammoth Kentucky jacks and jennets; big bone; plenty of weight. Forty head of 3 and 4-year-old jacks; also young stock for sale. Would be pleased to have you visit my farm for inspection or write for prices. I guarantee to please you. **Joe E. Wright, Junction City, Boyle County, Kentucky.**

CL VERDALE FARM

Breeders of jacks and Percheron horses. 20 three and four-year-old jacks; 15 yearlings.

Some nice Percheron stallions, mares and colts; also Tamworth Swine. All stock registered or subject to register.

Would be glad to have you visit our farm or write for circulars. **H. T. Brown & Co., Lexington, Fayette County, Kentucky.**

40--JACKS AND JENNETS--40

6TH ANNUAL

PUBLIC SALE

AT HIGGINSVILLE, MO.

MARCH 6. 1912

A Chance to Get a Good Dr. McCord Jack, or a Jennet Bred to him

These Jacks won 1st and 2nd Missouri State Fair 1911. Sired by Dr. McCord, 1776

This stock consists of yearlings to 5 years old. A lot of good serviceable jacks and jennets of the right kind, all good colors and well proportioned. All registered. Mostly sired by Dr. McCord, 1776.

W. J. FINLEY

Higginsville, Lafayette County, Missouri

50 miles East of Kansas City, on Chicago & Alton and Missouri Pacific Ry.

Leavenworth County Jack Farm

Forty-four head of Jacks and Jennets and our Percheron Stallion. Write for prices. Corson Bros., Potter, Atchison county, Kas.

FAIRVIEW STOCK FARM

25 Mammoth jacks from weanlings to 8 years; largest breeding herd in the West. Herd headed by the great Pharoah 2491, Champion of Tennessee in 1910.

H. T. Hineman, Dighton, Lane Co., Kansas.

Jacks & Percherons

Will sell one, or a carload of black registered jacks at reasonable prices. They are the high class kind. Don't handle cheap inferior jacks; this has been a breeding barn for 70 years. Catalogue January 1. **G. M. Scott, Rea, Andrew County, Missouri, R. 2.**

SOUND, HIGH CLASS, MAMMOTH JACKS.

14¾ to 15½ hands, Jack measure. The kind that demand good patronage. Guaranteed to work and breed. Come and get a bargain. **A. C. Briggs, Missouri Valley, Harrison County, Iowa.**

Fairview Jack and Jennet Farm

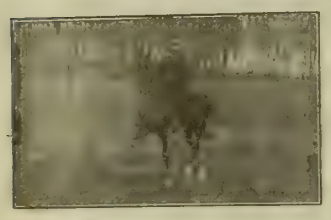
A fine assortment of the best Mammoth jacks and jennets that grow, 14½ to 16½ hands high; jacks with lots of bone and substance. Everything guaranteed as represented. Prices right. Address

J. C. Huckstep, Eolia, Pike Co., Mo.

JACKS AND JENNETS FOR SALE

I have 25 head of jacks on hand and 40 jennets that I can sell cheaper now than in the spring. If you want to make more money on your feed than you ever did before, and have stock used to its new home when the breeding season begins, come and see what I have. **Philip Walker, Moline, Elk Co., Kansas.**

JACKS AND MULES



300 head of Colorado raised Jacks, Jennets, Mules and Brood Mares. All guaranteed. Prices right. Lewis Swink & Son, Rocky Ford, Otero County, Colorado.

I HAVE FIVE JACKS

I want to sell. Four blacks. Mammoth bred, and one gray. One yearling, two 2 years old; one 4 years old and one 5 years old. **J. H. Hock, Buckner, Jackson County, Mo.**

Saddle and Speed Horses

AT

PUBLIC SALE

March 21, 22, 23

Saddle horses that can win in any company. Business saddle horses. Lady broke saddle horses. Ten head of young saddle stallions. Some registered saddle brood mares. Speed horses good enough to win on the grand circuit. These horses are right, not "has-beens." Ten head of good breeding jacks, also in the sale. I make my statements good. If interested, write me.

ONWARD WILKES FARM, JAS. HOUCHIN, Proprietor.
Jefferson City, Cole County, Mo.

REGISTERED SADDLERS.

We have 8 stallions and 12 mares and fillies **for sale.** Correspondence solicited from parties who mean business. **G. W. Davis, Mt. Carmel, Fleming Co., Kentucky.**

SADDLERS FOR SALE.

We offer at private sale a fine lot of stallions, mares, geldings, colts and fillies. For catalog address, **John T. Woodford, Mt. Sterling, Montgomery County, Kentucky.**

HOW TO RAISE COLTS

This book has been brought out by a stallioner, primarily for educational purposes for his own patrons.

Their many expressions of appreciation and the obvious advertising value to the stallioner are the reasons for offering it now to all other stallion owners for similar use.

It describes some of the most important processes involved, and difficulties met with in the production of colts and will aid the mare owner to keep his mares in better breeding condition and help to prevent losses from abortion, joint ill and other disorders.

MR. STALLIONER, EDUCATE YOUR CUSTOMERS! It will prove profitable to you as well as to them. Send 50 cents (refunded on quantity order) for sample copy and special low terms on 100 lots. Guaranteed to increase your business.

J. C. WALVOORD, Pub'r, Holland, Pemiscot County, Nebraska

A Big Public Sale of

Poland China Sows

And Big Gilts, Bred to Farrow In March and April, Will be Held Jointly

Monday, Feb. 26

By C. S. Nevius and Geo. Wedd & Son

The Hogs To Be Sold Are of the Best Big Type Breeding--25 yearlings and older that are proven producers, 10 fall yearlings and 15 big spring gilts. *The Sires Represented* Are—Designer, Major Loor, Good Metal, Kansas Wonder, Wedd's Expansion, Long King and Wonder Expansion.

Sale at Glenwood Farm, Chiles, Miami Co. Kas.

Johnson Automatic Stallion Bridle

Patent Applied for Nov. 10th, 1909.

Manufactured exclusively by Peter Young, Assumption, Ill.

Controls the most unruly stallion without injury and will not hurt the kindest and most docile horse. Fits the largest draft stallion or the smallest roadster without adjustment. Made of the best leather. Shipment will be made on receipt of order, as I have them in stock at all times.

Order one, and if not satisfactory, return it and your money will be cheerfully refunded. Price $5, with order. Can be sent by mail. Read these testimonials:

"Enclosed you will find check for $5 for which send one of your stallion bridles to Mr. Jacob Haning, Minier, Ill. Please send at once and oblige.

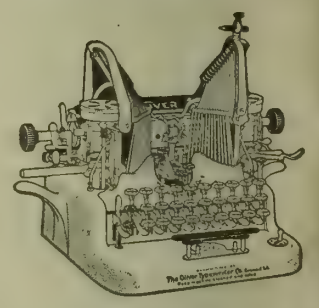
"P. S.—I have been using one of your stallion bridles for some time. Would not do without it, as you soon have perfect control of your stallion in a short time. Please send bridle to Mr. Jacob Haning at once. Send by mail. Val. Thomas, Jr., Hopedale, Ill."

"I have used the bridle but a few days which I recently purchased from you, but must say no horseman can afford to be without it. It will hold any horse. There is no equal to it. I advise every horseman to have one. E. A. Berlin, Waterloo, Wis."

"Will say the bridle I ordered came all right. The horse that we wanted it for was one that we could not use with a chain under the jaw. Had to use rein over his neck and hard to hold back at that. The bridle surprised him very much. My son says he cannot say too much for it. De Mott & Son, Scottsbluff, Neb."

PETER YOUNG,
Assumption, Christian County, Illinois.

"17 Cents a Day"



The Plan that Promotes Success

The "17-Cents-a-Day" Plan of purchasing The Oliver Typewriter means more than promoting sales of this wonderful writing machine. This plan is a positive and powerful factor in promoting the success of all who avail themselves of its benefits.

It means that this Company is giving practical assistance to earnest people everywhere by supplying them—for pennies—with the best typewriter in the world.

The "17-Cents-a-Day" Plan is directly in line with the present-day movement to substitute typewriting for handwriting in business correspondence.

Ownership of The Oliver Typewriter is fast becoming one of the essentials of success.

"17 Cents a Day" and The

Printype OLIVER Typewriter

The Standard Visible Writer.

There is no patent on the "17-Cents-a-Day" Purchase Plan.

We invented it and presented it to the public, with our compliments.

The "17-Cents--Day" Plan leaves no excuse for writing in primitive longhand. We have made it so easy to own The Oliver Typewriter that there's no need even to rent one.

"Just say "17 Cents a Day"—save your pennies—and soon the machine is yours!

The Oliver Typewriter is selling by thousands for 17 Cents a Day.

When even the School Children are buying machines on this simple, practical Plan, don't you think it is time for you to get an Oliver Typewriters.

17 Cents a Day.

Buys Newest Model

We sell the new Oliver Typewriter No. 5 for 17 Cents a Day.

We guarantee our No. 5 to be absolutely our best model.

The same machine that the great corporations use.

Their dollars cannot buy a better machine than you can for pennies.

The Oliver Typewriter No. 5 has many great conveniences not found on other machines.

We even supply it equipped to write the wonderful new PRINTYPE—for 17 Cents a Day.

Make the Machine Pay Its Cost

The Oliver Typewriter is a money-making machine. It helps "big business" pile up huge profits.

Tens of thousands of people rely on The Oliver Typewriter for their very bread and butter.

A small first payment puts the machine in your possession.

Then you can make it earn the money to meet the little payments.

If you are running a business of your own, use The Oliver Typewriter and make the business grow.

If you want to get a start in business, use The Oliver Typewriter as a battering-ram to force your way in!

The ability to operate The Oliver Typewriter is placing young people in good positions every day.

Get The Oliver Typewriter—on the "17-Cents-a-Day" Plan—it will help you win success.

Ask About The "Easy Way"

to secure the newest model Oliver Typewriter No. 5. The Art Catalog and full particulars of the "17-Cents-a-Day" Purchase Plan will be sent promptly on request. Address

Volume V. *Kansas City, Missouri, March 5, 1912* *Number 4*

TAYLOR & JONES
STALLIONS

Stallion buyers, why do Taylor & Jones sell more horses than almost any of their competitors? If you will stop to think, you will certainly know their horses must be better, their prices lower and their guarantee as good as can be written, as every man wants the best value for his money. We can please any customer in either Percherons, Shires or Belgians.

Our first importation in 1912 has just arrived at our barns and in the lot are many high class stallions, and as there has been no great expense on them as yet in the way of feed, care, risk, etc., we can sell them worth the money. If you are looking for a good horse, come and see us.

Taylor & Jones,

Williamsville, Sangamon County, Illinois

Trumans' Champion Stud

1878-1912

The World's Greatest Collection of

SHIRE STALLIONS AND MARES

PERCHERONS TO SUIT THE MOST CRITICAL BUYERS.
HACKNEYS OF RICHEST BREEDING AND STRONGEST INDIVIDUALITY.

Champions of Iowa, Minnesota, Wisconsin, New York and Illinois State Fairs this year. Our prices are the lowest. Our Horses are the Best. Send for our handsomely illustrated catalog. Mention The American Breeder when writing. First importation for 1912 arrived January 23. More to follow.

TRUMAN'S PIONEER STUD FARM, BUSHNELL, ILLINOIS

Imported Percheron Stallions
AT REASONABLE PRICES.

We have a large number of imported Percheron stallions and mares brought over last August, and will price them to you on **LOW MARGIN OF PROFIT.** We have cards, post cards, made of our animals and send them out on request. We also have newspaper folders of the ent re shipment and would be pleased to have you ask for them if you feel interested. We are **FARMERS, BREEDERS** and **IMPORTERS** and will accord you fair and gentlemanly treatment if you deem it to your interest to give us a call.

Barren Mare Investigations

A Study of the Problem From a Breeder's Standpoint, Which Led to Scientific Research and the Detection of Organisms That Produce a Condition Precluding Fertilization.

By Frank B. Graham, Editor.

YEARS ago when the writer first engaged in horse breeding he was early impressed with the vast number of mares that did not prove to be regular and yearly producers of foals. He became interested in the subject largely from an economic standpoint, for the reason that he soon learned that a certain class of mares meant nothing but wasted energy and vitality to his stallions and jacks. He gave the subject much thought and consideration and soon prided himself in being able to select with considerable certainty shy breeders. Experience impressed him with the thought that to breed such animals meant not only waste of masculine energy but also his stallions and jacks were positively injured by being permitted to make such services.

He further observed that after a stallion had served a mare presenting a certain clinical appearance that subsequent services on mares that appeared healthy and sound were not fruitful. The conviction grew that there must be some hidden cause that was responsible for mares not conceiving in which was presented a condition that required the very closest scrutiny to detect—mares that were robust and to one not familiar with breeding experiences would be pronounced in the very pink of physical condition.

The fact that such a large per cent of mares behaved and were affected in the same way led the writer to think that sterility in many cases in mares was due to a common cause, and that the cause was in the form of some one or several living organisms that found in the generative tract a suitable field for their propagation and growth; and further, their presence in these organs caused sufficient irritation of the parts to produce the few symptoms he had learned to detect, and that the organism exerted a harmful influence on the life of the spermatozoa. The fact that mares were not inclined to conceive when mated with a stallion that had only short time previously been permitted to serve a suspicious case was reasonable evidence that the organisms were capable of being transferred by means of the penis of the stallion, through the act of coition, to healthy mares. He early saw that the sterile mare was not only an annoyance and unprofitable to the owner but a positive menace to the community.

It has only been within the last year that the writer has been in position to give this subject the consideration and scientific study needed to prove or disprove the correctness of his early impressions. In connection with Dr. Stewart, pathologist, and several other qualified veterinarians, an extensive investigation was undertaken during the past season. In order to avoid any influence of local or climatic conditions the scope of the work was made as wide as possible and the investigations were extended into ten different states. Cooperating with stallion owners and local veterinarians dates were made for assembling the barren mares of a neighborhood, and it was surprising how many could be collected for examination. It was nothing unusual for as many as twenty to thirty head to be found assembled at one place even during the very busy part of the work season. The tour of investigation continued until over 1,000 head were inspected and studied.

Material was taken from these sterile mares and slides and cultures were made which were sent to the laboratories of Dr. A. T. Kinsley, bacteriologist at the Kansas City Veterinary College, for classification.

By separating these germs and growing them in pure cultures it has been found that when certain ones are injected into the uterus of a healthy mare that it is capable of producing the same train of symptoms that the writer used to recognize in mares years ago that would not conceive. These cultures have been injected into sound mares repeatedly with uniform results.

Only recently a healthy mare doing regular work was purchased and a culture was injected into her uterus. The injection was made February 9, and on February 16 she was killed and the parts carefully dissected and examined in the presence of about fifty expert horse breeders. In this short period of time a remarkably diseased condition of the uterus had developed, demonstrating that the organism is capable of inducing rapid changes in the tissues. It is capable of producing a condition in the organs that is disastrous to the life of the spermatozoa. The writer has on numerous occasions withdrawn the semen from a uterus presenting the above conditions, only to find the spermatozoa inactive or entirely destroyed. These same sires were used later on healthy mares and the spermatozoa were found in the best possible condition.

These investigations have made it plain why a great class of mares fail to breed, and while the acquiring of this knowledge has been very expensive to us, we believe the outlay has been justified in the better service we are able to render the American breeder.

It is very difficult to estimate the loss that may occur from a barren mare. The profit in keeping mares in preference to geldings lie largely in her ability to produce a yearly foal. Should she fail to do this she has failed in the special function for which she was chosen. Yet that alone would not be the greatest loss sustained. The fact that she is a disseminator of sterility is her greatest fault. If any stallion owner will make a careful study of these cases so that he can be able to recognize them and will then carefully watch and compare notations in his record book he will find that very frequently sound, healthy mares that should conceive at the first service fail to breed when served shortly after the sterile mare. Records have shown instances where a single mare receiving several services during the season has been responsible for from fifteen to fifty other mares not producing foals that year. That sterility is being promoted at the present time goes without saying, for the reason that the present remunerative prices for horses has induced breeders to offer for service almost anything in the way of a female and from among the lot develops many of confirmed sterility.

AN EXAMPLE OF THE COST OF DISEASED MARES.

In the course of two years this mare was served by a stallion of known virility 14 times without getting in foal. Sixty-one others (about a third of them nine day mares), that followed this mare to the stallion within five days, failed to produce.

The most important lesson for the breeder to gather from these educational questions is to learn to reject diseased mares. The progressive, wide-awake breeder should advise with his veterinarian and become still better informed on the principles governing infection so that he may better protect his interests from the harmful influences of the general public. On the other hand, the stallion and jack owner stands in the position of an educator and the mare owner usually looks to him for counsel and advice.

Probably one reason why the practice of breeding stallions to this class of mares indiscriminately has continued is that contact with mares of the kind alluded to does not cause any local trouble in the way of eruptions or malignant sores on the penis of the horse. This affection, which beyond doubt is responsible for sterility, should not be confounded with genital horse pox or that more dreaded disease, dourine. These two diseases are transmissible through the act of coition and cause the appearance of sores on the penis. They are diseases that are inclined to induce sterility either temporary or permanent.

We expect to continue the investigation inaugurated, and in this we want the full co-operation of every reader of the American Breeder that is interested in the subject of barrenness in all stock. We believe we have reached a sound conclusion as to its specific cause in the great majority of cases. We believe further in its transmissibility through the act of coition and this being true, it naturally follows that one of the best ways of eradicating the difficulty is not to allow the breeding of affected mares. Errors will continue to be made in not recognizing the symptoms of the disease and it is reasonable to believe that sterility, due primarily to bacterial infection, will, to some extent, continue a menace to better profits in the horse breeding industry for some time to come.

The great need of the day is something that will lead to eradication by process of immunization. Through persistent application and experiment, scientists have been able to fortify not only man but animals against infectious diseases by introducing into their bodies certain substances of either positive or suspected bacterial nature, which has resulted in an immunity of that person or animal to the particular disease. No better example can be recited than the vaccination against smallpox in man, black leg in cattle and hog cholera in swine.

It has been found possible to not only prevent but to cure certain diseases by employing these principles and the developments of the last few years attest the remarkable strides science is making in this direction. This phase of sterility is going to receive no little consideration during the present season's investigations.

Conformation of Draft Horses

Points of Importance and Why They Are Important. The Mechanics of a Moving Horse. Strength, Freedom of Motion and Durability Revealed in Symmetrical Form.

Written for The American Breeder
By Prof. E. N. Wentworth, Iowa State College, Ames, Iowa.

FROM a time far antedating the dawn of history, the horse has been man's constant companion and servant, and because of his high intelligence and sagacity, one is inclined to forget that for proper service he must have such conformation as to be a thoroughly efficient machine. The mentality of the horse, its temperament, traits and habits, in the minds of many men overshadow the actual build of the animal, and as a result some of the organs and parts most prone to weakness, are absolutely neglected. The old asying that a chain is as strong as its weakest link finds admirable illustration in the horse, for the combination of bones, joints, ligaments, tendons and muscles that are the working part of the animal, through mere numbers can not always be equally strong and secure. It is not the intention of the writer to discuss the conformation of the horse in toto, but rather to give attention to some of these "links" which often fail in the stress of severe service and thus totally or partially destroy the animal's efficiency. Through the mind of the artisan with his ideas of mechanics rather than the eyes of the artist with his conception of beauty and the finished product, the following discussion is put forth:

The Bones as Levers.—Each joint in the entire animal, each bone that meets the joints, and each attachment of ligament tendon or muscle, serves to give some mechanical advantage in the application of power. There are three different kinds of levers, represented by the see-saw, wheelbarrow and sheep-shears, and each type finds representation in the horse. The see-saw lever is found when the horse kicks, the hock being the center or fulcrum, the gaskins and thighs the power and the extending foot the weight. The wheelbarrow lever is in the hind limb when the horse is moving forward. The foot on the ground is teh fulcrum, corresponding to the wheel of the barrow, the weight or strain is at the hock and the power in the thigh and gaskin once more. The sheep shear lever finds illustration in the hind limb when the horse extends it in taking a forward step. Here the weight is at the foot or limb, the power in muscles of thigh and the fulcrum at the hip joint. We thus see that in one limb alone, when performing different functions, different leverages are obtainable. What is true of the hind limb is true of nearly all of the functioning bony organs of the body, and as a result we find the first and second class of levers named giving mechanical advantage for strength, while the third develops speed.

The Mechanics of Muscle.—In the development of the two distinct types of light and heavy horses, there has been a remarkable differentiation in the kind of muscle. The thickly bulging muscles of the draft horse from their external appearance would discredit the lean sinewy quarters of the trotter or runner; yet, at his own game the latter can make sport of his muscle-bound rival. What principle applies here that permits of this marked deviation? The reasoning is simple and a law may be stated as follows: Other things being equal, a muscle is as strong proportionally as the area of its cross section. Also, other things being equal, the speed of a muscle's contraction, when applied to a bony lever, is in direct proportion to its length. Each muscle is made up of a mass of long fibrilar cells controlled in the center by a nucleus, and capable of contracting about one-fourth of their length. When a nerve stimulus reaches these cells, the impulse to contract, owing to the rapidity with which the nerve message carries, arrives at each cell at practically the same time. Therefore the muscle twenty inches long will contract its five inches while another twelve inches long is contracting its three inches. The increased speed which thus results accounts for the long limbs and muscles and greater activity of the light horse as compared with the drafter. Length does not add strength to a muscle, as a muscle of the same cross section will be equally powerful whether three or thirty inches long. In fact it may be stronger when short, owing to its compactness.

The Foot.—The medium through which a horse applies his power is the bony skeleton. Eact time a ton horse takes a step forward, a weight of almost fifteen hundred pounds comes on each front foot alternately. The amount of weight or jar also varies proportionately with the speed, so that if the bony column were unprotected at the end, a sensation equal to a kick on the shin 1,500 pounds strong or better would result with each step. As no one could possibly claim to relish such a blow let us examine what means nature has taken to fortify the horse against it. At the extremity of each limb a horny box encases three cartilaginous suchions that absorb the main part of the jar from the bone of the foot. One of these, the fleshy frog, is the same shape, approximately as the horny frog of the sole except that it extends up behind the bone of the foot; while the other two, known as lateral cartilages, lie to either side and project well up into the region of the coronet or hoof head. The horny wall itself is not absolutely rigid but has an amount of elasticity that removes part of the direct shock of contact. Here is where one finds justification for the accepted conformation of foot.

The sole of the foot should be concave since its arch furnishes a springiness very desirable, and it should be round and wide, since it gives more room internally for the spread of the cartilages. The frog should be prominent and the heels and quarters of the foot broad, for these parts are the most elastic of the entire horny box, and must be so formed as to give proper response when the weight comes from above. The coronet or hoof head is the most important part of the entire foot, for from it the horny wall grows, and only when round, wide and strongly made will a good foot grow naturally. The Scotch were the first to recognize this point and today the magnificent Clydesdale foot is strong evidence of the merit of the idea. A horse too narrow and pinched in his hoof heads, as in Fig. 1, is one that tends strongly to side bones, for the lateral cartilages do not have room to expand, bruises and inflammation result, and the bone salts deposited in the cartilages soon stiffen the hoof until the horse becomes lame. An extreme too much the other way with very open hoof heads and flat soles brings the same result, for the flatness of foot again prevents the proper elasticity.

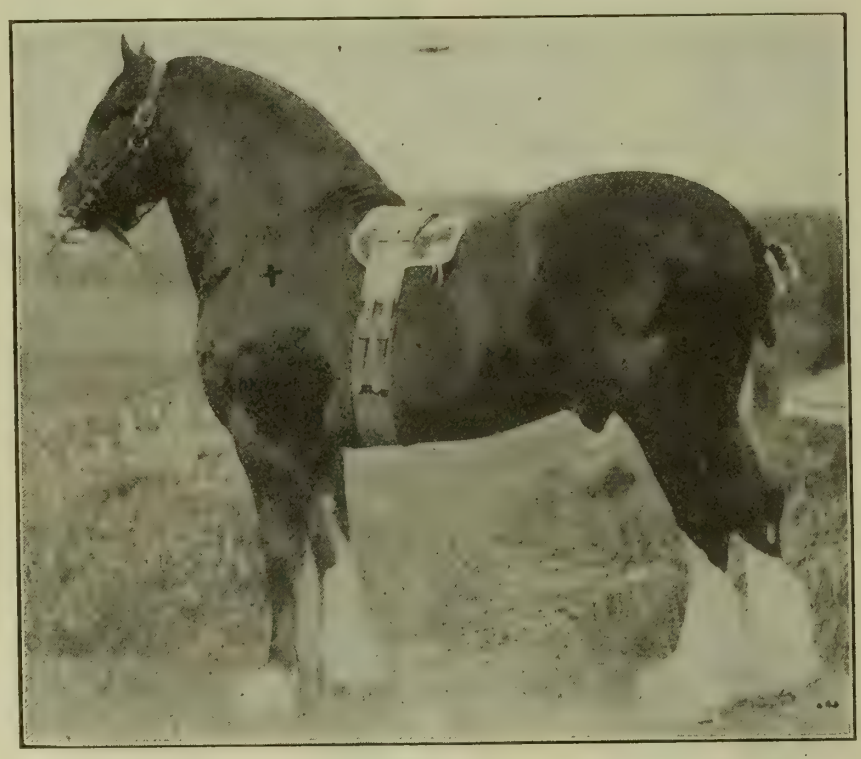

FIG. 3.
Famous Clydesdale Stallion, Baron's Pride, Illustrating Relation Between Level Croup, Strong Coupling and Well Set Hind Leg.

The Pastern.—In an effort to get a hoof that will stand all kinds of jar and rough usage, Percheron, Belgian and light horse breeders have produced a tough horny wall tat may well be envied by all other horsemen. While without doubt this tough wall is a marked improvement over the shellier sort, yet when the foot is illy formed, no amount of tough tissue can save the jars and inflammation that appear internally. As an assistant to the elastic foot, saddle horsemen, Clydesdale breeders and others have especially emphasized a olng, sloping, springy pastern. As the spring wagon provides more comfort in traveling when compared to the flat wheeled lumber type, so does the horse with the long sloping pastern distribute the jar of heavy traveling when a strong and responsive organ gives down partially at each step. An angle with the ground of 45 to 50 degrees in front and 50 to 55 degrees behind is supposed to give the best combination of strength and shock absorption. A criticism of the long sloping pastern frequently made is that it is apt to break down under the horse, but after a careful inquiry the writer feels that he is safe in saying that where one horse becomes partialy or totally unserviceable from this cause twenty-five are lost from steep straight pasterns such as shown in Figs. 1 and 2. Compare these with the picture of Baron's Pride and one can readily see the great advantage of slope.

The Knee.—The knee is of absolute beauty only when a flat razor-like bone in the cannon gives it the support and leverage for perfect service, and when the knee itself possesses a width and particularly depth from front to rear that assures one of a life as long as that of the animal that possesses it. A joint is more than a mere bend in the leg to facilitate motion. It must have bearing surfaces which shall so distribute weight and strain that the joint shall equal the bones that meet there. Further, it must be mechanically efficient so that its deep set tendons shall give ample leverage to the limb in motion.

The Hock.—The same points that applied in the discussion of the knee apply here, only the greater strains to which the hock is subjected demand especial consideration. The knee supports, except in saddle horses, practically the body weight alone, while the hock with its propulsive power, must respond equally well when the animal is alone or when hitched to one and two ton loads. As a result of this varying effort the hock is one of the first "links" to fail and possesses more varieties of unsoundness and blemish than any other part of the body. A properly formed hock should be deep from front to back and strongly supported with tenodns widely separated from the cannon bone. If this support is lacking or if the angle is too great as in sickle hock, there is a tendency to curb. In this connection it may be noted that the heel of the hock should extend clear down to the back of the tendon and give a proper squareness in shape to the joint. Compare the magnificent hocks of the horse in Fig. 3 with those displayed in Fig. 2. The difference of squareness and heel development of the joint are marked. In addition to this formation below, the point of the hock should be prominent so as to give sufficient leverage and the fold of the hock should be clean cut and flinty. When a joint is in this latter condition, one may assume that it is responding perfectly to its work. A hock that bows out tends to bone spavin, one that has too little angle tends to bogginess and occult spavin, one that has too much angle tends to curb, thoropin and bogginess as well. The writer is not aware of any unsound condition associated with cow hocks, but does know that they materially affect action.

Set of Limbs.—A properly set limb finds its actuating cause in the part trom which it comes. When a fore limb is placed correctly a plumb line dropped from the acromian spine (marked x in Fig. 3, a roughened spot in the bone half way up the shoulder) should bisect the limb through the fetlock and fall at the rear of the foot. The same view of the hind foot should show it divided by a plumb line from the hip joint and this same line should fall down the front of the cannon and bisect the foot, while one dropped from the point of the buttock should fall along the rear of the cannon. From the posterior the line dropped from the point of the buttock should bisect the column of bone entirely and the hock down to the foot, in the limb itself.

There are two propositions in the preceding paragraph that are worthy of more extended discussion. First, the statement that a properly set limb

finds its origin in the part from which it comes. In Fig. 3 the writer has indicated the position of the acromian spine by a cross. If Baron's Pride had a less sloping shoulder the acromian spine would come further forward and if the limb fulfilled the specifications already mentioned it would be too steep and straight. The same is true in regard to the levelness of croup. A sloping croup will either result in a sickle hock as in Fig. 2, or else if the specifications are fulfilled the limb will be too straight and the animal be of the

FIG. 1.
Legs Too Straight.

"post-legged" variety. Length and levelness are essential in the croup, and slope in the shoulder, if the animal is to attain perfection in its under-pinning.

Secondly, the writer would call attention to the emphasis he laid on the bisection of the column of bone. In Fig. 1, a line has been shaded to represent the true direction of this column. One will observe that the upper part of the limb is divided so that the external part is much larger. That which corresponds to the bone of the shin and forearm of man comes to the surface on the interior side and the muscle lies on the exterior. If instead of bisecting the column of bone, the line bisects the limb, the bone above the knee will then fall

FIG. 2.
howing Sloping Croup, Sickle Hock Poorly Supported, Straight Pasterns and Low, Flat Foot.

nside the perpendicular line drawn. When the animal of this formation is ubjected to severe draught, the tress will not only be directly down- ward but also outward. The point ere made applies more strongly be- ind than it does in front, conse- uently the insistence of some horse-

More Good Stallions Wanted

A Plan By Which Stallion and Mare Owners May Co-operate to Bring in Valuable Animals and Greatly Improve the Horses of Their Communities.

There are not enough good stallions in use in this country. It requires considerable capital to purchase a good stallion. For several years we have watched several stallion organizations and the successful as well as the unsuccessful methods of conducting them.

There are thousands of men who have had much successful experience with stallions, but many of these do not have the capital necessary to buy a good sire. We are introducing, after much conservative thought, a plan by which these men can get good stallions and which we believe will greatly advance horse production in this country. The first thing necessary in the stallion business is the knowledge of horse breeding. This is one of the reasons that so many of the company stallions have failed.

There are hundreds of experienced men in the country, each of whom can select a few substantial farmers and form a partnership to buy a good stallion. It is not necessary that these stallions cost a fortune, but a good one can be purchased for cash for from $1,500 to $2,000, and it will not be difficult to find partners who will put in $200 or $300 each to buy a good stallion and pay the cash or its equivalent. It is not necessary that a stallion firm ship a stallion into a locality at a cost of from $500 to $1,000 in order to form a company. It is not necessary that a stranger come into the locality and form a company of men who were never intended to be associated together in business. An individual who is personally acquainted in a community can take one or two good, substantial farmers into his confidence and ask them who they would like to have join this association. They will gladly help to get others, but it should not be understood that a stallion will pay large dividends from the start. Under modern methods a good stallion could pay for himself in from one to three years, above all expenses, if properly handled in any ordinary community.

Where there are several men equal owners of a stallion and all interested, more business can be had than if the stallion was owned by one man. But everyone interested in a proposition of this kind must be honest with his partners or the plan will be a failure. No one must accept any commission for making the deal either in cash or in shares. The stallion must be purchased at a fair market value. Two or three of the company should be delegated to make the purchase. These men should be good judges of the particular type and quality of stallion wanted. They must also be honest with their partners. Under modern methods a good stallion properly supported by a half dozen good, responsible farmers should secure most of the business in that section, and breed all the mares that come. Five hundred mares can be bred to one stallion during one breeding season very easily, with as great a per cent of foals as fifty mares could be bred to the same stallion with the natural service.

The partnership should not expect the one who cares for the stallion to do this for nothing. Standing of stallions is a profession, and professional men are not employed for $15 a month. It is worth at least $400 to keep a stallion one year. The keeper should have $2 for each colt that is produced by artificial methods, so that the business may be profitable to the keeper. The more money there is in sight for the keeper in a business way the more he will try to perform his duties as a rule. If he does not attend strictly to business someone else will want his job.

Horsemen must get their eyes open to the new methods of horse breeding, and those who awaken to this opportunity first will be the successful breeders. The location must be considered, for if there are sufficient stallions to attend to the business in that section it would not be good policy to bring in another. The mare owners should be consulted as to the kind of stallion they want. They are the ones who will furnish the patronage, and many of them will promise their patronage if their wishes are complied with. There are a lot of breeders who have cheap, inferior stallions that could well afford to dispose of them, or use them for teasers, and buy a good horse with a few partners and make more money for himself. There are a lot of these men who do not collect as much money from their stallions as they could receive in wages for attending a good horse.

There is no reason why a half dozen good, substantial farmers could not get along together nicely and help improve the stock in their communities. There is another class of men who should be interested in a proposition of this kind, and that is the class of the breeders who has a few registered mares but who does not have a stallion good enough to breed his mares to. This would afford him opportunity for buying one of the best stallions in the country. A young stallion should be purchased and used for four or five seasons, after which he could be exchanged for another good stallion. A few top crosses of this kind improves the horse stock wonderfully. It is hard to estimate the real value of a good sire where he is used to the best advantage. We expect to see thousands of these organization started within a short time, and have prepared all necessary blanks and other literature for forming these organizations. They will be sent to any of our readers free of charge for the asking.

GETTING RID OF BLIND STAGGERS CAUSE.

In giving results of his investigation of horse ailments seemingly induced by feeding moldy corn, Dr. T. P. Haslam of the Kansas Agricultural College veterinary department, for which he conducted the investigations, says:

"It is not safe under any circumstances to pasture horses in stalk fields or to feed them fodder from fields in which the corn was wormy. Great care should be exercised in choosing the corn fed to horses. Often it is not thoroughly cleaned by fanning. There are too many moldy grains which are too heavy to be separated from the sound corn in this way. The safest method is to pour the shelled corn into water and skim off and throw away all the part that rises to the surface."

Dr. Haslam also quotes Dr. C. B. Fort, a veterinarian of Salina, Kas., on the experience of one of Kansas' biggest horse raisers and importers:

"During the winter of 1908 and 1909," reports Dr. Fort, "C. W. Lamer lost twenty head of horses out of 260 head, all on full feed, from blind staggers. He fed shelled corn, fanned and ground, alfalfa meal, oil meal one-half pound per head a day, and alfalfa hay. Last winter (1910-11) he fed 200 head and never lost a horse. The feed was the same as before; the method of feeding, however, was changed somewhat. He put the shelled corn, after fanning, into a large tank of water and skimmed off the bad grains, in fact everything that would rise to the top."

"This," Dr. Haslam continues, "agrees with the experiences of many other veterinarians. Good results are reported by some from thoroughly fanning the shelled corn, then grinding it and mixing it with equal parts of oats and bran. Others say little trouble results from pasturing stalks if there is a good growth of green wheat in the field; in short, any treatment that removes the moldy grains or worm dirt lessens the danger. Pouring the corn into water is the best method of purifying it."

The experiments at the Kansas College, which seem to have removed any possible doubt as to the precautions to be observed by horsemen if they would save losses from feeding moldy corn, included the use of 16 horses in a feeding test. A point, however, which is not entirely settled is the fixing of responsibility for the trouble on the particular part of the so-called moldy ears. The decayed corn, the mold which comes as an after growth, the worm "dust" or excrement, and molds which are found growing in the worm dust are all under suspicion. It is certain, however, that all should be avoided and Dr. Haslam strongly urges the use of water as practiced by Mr. Lamer, for getting rid of all possible deleterious substances in the corn.

PERCHERON BRANDS.

The subject of Percheron brands has worried the breeders in America for the last quarter of a century. Many of the best breeders in the Percheron district in France brand their

Roan Mare on Which the Brand Shows Plainly.

colts on the neck with the letters, P and S, the S is placed over the P, making a brand similar to the American dollar sign. But they are not all branded. Some of the best horses that have ever left France have not had brands on them anywhere.

There are other brands on Percheron horses. A star on the neck means that the stallion can stand for public service in France. The letter R means that the stallion has been rejected from moon blindness or thick wind. Very few animals come to this country with either the star or the letter R brand.

Most of the stallions that are intended for the American trade are never examined. It is not necessary that an imported Percheron horse have any brands to be genuine. There is only one brand that is essential and that is the brand that the Bureau of Animal Industry stamps on the certificate of imported horses. All live stock imported since January 1st, 1911, should have stamped on the foreign certificate the following: "Passed free of entry, this .... date, by the Bureau of Animal Industry. ..... Signature."

The Bureau of Animal Industry admits Percheron horses that fill their requirements even though they are not branded. We take the government ruling as final.

Kindly mention the American Breeder when writing to our advertisers.

Draft Horses in the Corn Belt

How Their Use Has Increased Since Days of Louis Napoleon. How the Farms Very Profitably Can Help Meet a Constantly Broadening Demand.

Written for The American Breeder,
By Prof. E. A. Trowbridge, Missouri College of Agriculture.

WHEN the Dillons brought the old Percheron stallion, Louis Napoleon, from Ohio to Normal, Ill., he was looked upon by people of that section of the country as an abnormality and by many his usefulness was questioned. We are told that when he was first exhibited at the Illinois State Fair his owners were forbidden to parade him upon the race track, fear being expressed that his enormous weight would ruin the track for racing. He was so out of the ordinary as to size that many looked upon him as a curiosity rather than a horse destined to set a new standard and type and to help revolutionize the farm labor of the corn belt. It was in 1856 and Louis Napoleon at that time is said to have weighed 1,650 pounds, and was 15½ hands high.

The change which the 56 years that followed have brought are scarcely believable to those of us living in this progressive day and age. What must have been the opinions of those people who were on the scene of action when Louis Napoleon first made his appearance? Today the State of Illinois at her great state fair does not need to exhibit her draft horses upon the race track because buildings have been provided for that purpose. Today that state and the entire corn belt does not look upon the draft horse as a curiosity but an economic necessity without which farming operations would be seriously crippled, the profits of the farm decreased and the hauling and transfer work of cities paralyzed. The term "draft horse" in the corn belt today does not mean a race of horses the largest of which weigh 1,600 pounds, but rather one in which the weights range from this figure as the lower limit to a ton or 2,100 to 2,200 pounds. In the place of the one horse of little more than fifty years ago nearly every farm in the corn belt has, or is trying to produce, big, sound draft horses.

Great changes do not occur without causes and the draft horse and his present popularity in the corn belt are no exception to the rule. What then is the cause for this unprecedented growth in numbers and popularity? Is it because men were born to admire strength or because there are no other horses available? In the last analysis it will appear that the reason for the growth of the draft horse industry, its present status and its future prospects, are based upon his ability to return, in dollars and cents, a profit not otherwise obtained by farmers in most sections of the corn belt.

When Louis Napoleon's first crop of foals had grown to the age at which they could be worked and show their prowess, the reputation of this premier Percheron as a sire was established. It is said that before the horse left Ohio to come to Illinois his owner collected in the year 1856 for service fees $1,800. From the reputation which he has attained his value as a sire must have been realized beyond the bounds of the county in which he existed.

These sons and daughters of Louis Napoleon were bigger than the ordinary horse at that time. They had more weight to put into the collar and this made ordinary farm work easier for them than for horses of less weight. Heavier loads could be hauled to market over roads that were none too good. A smaller number of these horses was required to operate farm machinery. Plows could be set deeper and land more thoroughly cultivated with the same implements as were used before and better crops resulted.

As soon as people had seen the relative efficiency of the bigger horses as compared with that of the horses that they had been using, the demand for breeding stock of this heavier sort sprang up. With this demand came the importer of horses, who brought from France and England and Scotland many horses to be used in this country for breeding purposes. In the beginning the importations were mostly stallions, but as time went on the corn belt farmers began to realize that they could grow their own breeding stock and today we are importing large numbers of mares as well as stallions. The popularity of the draft horse has increased so there exists today a demand for all the good draft horses that can be imported and all the good registered draft horses that are produced in this country.

With the general acceptance of the heavier type of horses in the corn belt, the establishments which manufacture farm machinery began to increase the size of their machines. Plows were made wider and implements of all sorts were made to do more work in a given length of time. It was seen that these implements could be handled efficiently by the heavier horses that were growing in popularity in the corn belt.

The land in the corn belt was particularly adaptable to this type of machinery and this type of horse. The land was level and the soil was heavy and rich. The farms and fields were comparatively large and every move that was made toward the use of bigger machines and bigger horses proved efficient.

Following close upon these economical changes came the increase in the price of labor. From 1877 until 1895 America saw a period of prosperity. Much construction work was done and much land cleared and the western border of the United States extended further to the Pacific ocean. This made an increased demand for labor and consequently farm labor became scarce. With this relatively higher price of labor came greater efficiency of the big horses and big machines, since one man could do more work in one day with this apparatus than he could with the lighter sorts of machinery and horses.

With all these factors pointing toward the efficiency of the draft horse came the demand for them from the cities. As our cities grew larger and traffic became more congested, more streets were paved, and labor higher in price, the cities increased their demand for horses that could haul heavy loads on smooth streets. Heavy loads were necessary because of the distances which increased as the cities became larger, and because less time was taken in waiting for an opportunity to load or unload at a crowded platform.

The efficiency of the draft horse may be questioned on farms in some sections of the country, may be questioned on country roads, but there is no one who questions his ability on the smooth streets of the city. Under this condition with absolutely no foothold except the smooth surface the weight that any horse has to throw into the collar determines his efficiency. The mule is perhaps more efficient than the draft horse in some cases, but on the streets of our northern cities his lack of weight handicaps him, and these factors are the primary ones which have developed the unprecedented demand for horses of weight and quality.

Horses working in the soft dirt at farm labor or on comparatively soft country roads are not subjected to the constant concussion and hard usage that they are on the city streets. Horses lacking in quality and proper conformation of feet and legs will do work well so long as they are in the soft ground, but as soon as horses of this character are put to work upon the hard streets their feet become sore, their joints stiffened and they become otherwise inefficient. This condition has developed a demand for quality in draft horses, particularly for city use, and this fact is proven only too well by the fact that today city buyers are coming to the country, taking the very cream of our draft horse product so far as quality and weight are concerned, shipping them back to the city to be used on the streets. If one desires to see one of the most magnificent displays of draft horse strength and quality under the stress of strain and hard work, he has but to visit some of the great packing plants or transfer companies of our cities. Horses purchased by these people are of the best quality and the heaviest weights and represent the best of our production.

The demand from the cities continues and the demand on the farms of the corn belt is increasing. With our more congested conditions in the cities and our more intensified farming operations and the number of draft horses which can profitably be used, is increasing. What the future of the business will be is a question, but present indications go to show that we have only started our progress in this direction.

The demand for these horses is no longer a question. It exists, and the buyers are scouring the country to find enough to supply the demands of the city and in all too many cases the farmers are selling their best horses and keeping the more unsalable ones for breeding purposes. If this action continues for any very great length of time a scarcity in breeding stock is bound to occur. While the cities of our country use vast numbers of horses, they produce practically none of them, consequently it is left for the farmers of the corn belt for a time at least, to produce draft horses not only for use upon their own farms and in their small towns, but also for the use in the great cities of the Middle West and the East. This means that the production must be far in excess of the demand at home for this class of horses.

The production of horses is not a production which is exactly comparable to the production of cattle or other classes of live stock. All other classes of animals are produced in large numbers on a given farm, but the greatest progress in horse breeding and in most cases the most profitable systems of horse breeding have been those systems where a few mares have been owned by each farmer and a few colts produced each year and made ready for market at maturity. We are told that in the district of La Perche in France every farmer owns a few good mares which produce foals. These foals are bought up some time after being weaned, by the horse dealers from whose hands they ultimately go to market. The same thing is true of the Clydesdales.

The question might be asked as to what is a logical system for the corn belt farmer to practice in the production of draft horses. On the average diversified farm of the corn belt the greatest success has been attained and profit reaped from a system which keeps enough draft mares on the farm to do the greater part of the farm work. These mares are each year bred to good stallions and produce good foals. These foals are generously fed and well cared for until they are ready to go to work. They are put to work at from 2½ to 3 years of age and work until they are 4 to 6 years old, when they are ready for market. From these foals the brood mare stock is replenished. The best mares are not offered for sale, but are used to fill the place of mares which have failed to breed or have become too old to be of service. The surplus in the way of geldings and mares not suited for breeding are sold

(Continued on page 25.)

WHEN THE EDITOR WAS IN THE HORSE BUSINESS, WITH A BREEDER'S INTEREST IN THE PROBLEMS WHICH LED TO THE ESTABLISHMENT OF THE AMERICAN BREEDER.

New Era In Breeding Reached

The Established Use of Capsules Means Unprecedented Improvement In the Horse Stock of This Country and Better Business for Importers and Breeders. The Evidence.

T is a matter of no small importance that we are able now to state that a new era in horse breeding has been reached. In the January 20 issue of the American Breeder we invited our readers to give their experience concerning the capsule system of breeding. Two pages of signed statements were printed in the issue of February 5. We are sorry that we can not print all of the hundreds of testimonials received at this office before and since that time, but for this issue we have space for only a few.

There probably will be more mares bred with the capsule system this year than have been bred in all time before by artificial impregnation. There probably is not a breeder alive who does not actually know of a colt which has been produced without the stallion or jack serving the mare. If one colt can be produced artificially, why can not thousands of them be gotten with the more modern methods? If a man can multiply by ten the colts his stallion can sire why should he not own the best horse he can buy and strengthen his hold on the best trade? These are questions the stallioner is asking himself, and in their answer the breeder and importer finds encouragement to breed and buy a better class of horses than ever before, with certainty of a more ready sale.

Yes, the breeders are learning to be more progressive. They have learned to use only such instruments as can be boiled, knowing that they must be clean with their work. They have learned that the semen must be kept at the right temperature, and that the semen must not be taken from a diseased mare when other mares are to be bred. If there are any who doubt the possibilities of the modern methods of horse breeding, they can investigate the signed statements which follow:

I am satisfied that I accomplished a great deal by the capsule system by saving horses and jacks. Will have plenty of colts to show in the spring. —H. C. Jackson, Dimmitt, Tex.

I have used the capsule system for the past two years and have been very successful. Had success with the capsule system when all other ways had been failures.—W. H. Barlett, Kane, Pa.

In regard to my success with the capsule system, will say that I foaled two valuable mares last year, that I had made up my mind would never breed. One of the mares had never shown to be in heat in the past two years I have owned her, though tried every other day for six months at a time. We finally bred her with a capsule and she got in foal the first time. Those two mares cost me $2,000, and you can figure out what I think of the capsule system as an investment.—Jos. H. Warren, Delaplane, Va.

I have been using the capsule system of breeding for two years. Have had good success with it. Can get every mare in foal with capsules that could be settled by natural service, and a great many that could not be settled naturally. I have lots of capsule colts in this locality and if a man brings me a dozen mares at one time he can get them all bred.—D. H. Adcock, Alexis, Ill.

The capsule system is a sure solution to your troubles if you are standing a stallion or jack, as I am doing. I have settled five mares that were shy breeders, only by the use of capsules. It's a money maker. —John E. Sadring, Bridger, Mont.

As to my success with the capsule system, will say that I never used it a great deal last season, but I see the mares are showing up to be in foal good. I think where it is handled right it is a great success.—P. H. Summers, Callao, Mo.

Have used the capsule system for two years and find that I can settle mares easier and with more certainty than depending on the natural service. I feel that I have the advantage of those who depend on the natural service, as I can turn away more mares i na day than they can in a week.—W. F. Burnett, Vergennes, Ill.

The capsule system is a success in settling mares. Where I have used them, the mares show just as good a per cent of being in foal or even better, than the straight service, and it is a great help in the busy time of the breeding season for the mare owners and the stallion owners. The stallion owner can use the scientific breeding to better advantage if the mare owners know something about it.—Wm. Raets, Junction City, Kas., R. R. No. 4.

The capsule system is a success, and the only system of breeding. If I had to discontinue the capsule system I would quit the business. My success has been equally as good in settling mares by the artificial way as by the natural way.—M. A. Ray, Jefferson, Okla.

I had fine success with the capsule system and will continue to use it. Results are far above expectation.—Chas. Irvine, Ankeny, Ia.

I have had good success with the capsule system. Collected $700 last year from one horse at $10 a colt, and think I will do as well this year.—Alfred Bashen, Bowen, Ill.

There is no question in my mind as to whether the capsule system is a success or not. I have got colts from mares that could not be gotten to come in heat. I bred them with a capsule and they brought colts the next spring. I have a customer that has two mares. He had the horse serve one, and me serve the other with the Carlson semen extractor. I just divided the charge. These mares get their turns with the horse, one one year and the other the next. He has three pairs of colts in sight now—two mares safe in foal. If any one doubts this, if they will come here will show them the colts and can prove it by the man that owns the mares.—D. L. Olson, Moroni, Utah.

We consider the capsule method of breeding a success. We succeeded in settling mares that had never bred before. It has enabled us to the extent that we will reduce the price of our two imported stallions, one Belgian and one Percheron, and one registered combination stallion, and three jacks to scrub prices or less. We would advise every breeder in the United States to get posted, as they will be able to save time and money. —J. R. Smith, V. S., Seymour, Tex.

I consider the capsule method a success when properly handled.—Thomas McDonald, Amorita, Okla.

Will say I have had good results from capsule breeding. I bred as high as nine nice mares with one service of the horse, and have the mares with foal, that were never settled before. The capsule system is all right —in fact the only way.—S. S. Olds, Deercreek, Okla.

The writer takes great pleasure in stating that out of 23 mares bred artificially last season, 22 of them are showing heavily with foal. The other one was safe till the owner used her in a manner that caused abortion. To do without the capsule system I would as soon do without the expected profit in breeding, as I consider it the redeeming feature.—Thos. Rouch, Harris, Ark.

I used the capsule system in breeding my mares last year for my first time, and from the looks of the mares I believe I am going to get as good a colt crop this year as could be expected under any circumstances, and I do believe the capsule system to be a grand success, and besides by using the capsule method I do not take any chance on the horse making the wrong entry, or exciting my mare or endangering the foal by kicks from stallion or mare. And furthermore, I believe a mare is more apt to get in foal by the capsule system. I believe a horse or a jack will get more foals and better foals, as he will be required to make only one service a day.—H. S. Record, Monument, N. M.

I have two "every-other-year" mares which raised colts this year (1911) and I tried to fool them with a capsule, and they are both in foal. Only bred three mares with capsules, and they are all in foal. As a mare owner I want to use the capsule system, and as a stallion owner I will use it.—Harry A. Weaver, Laclede, Ill.

I only use the capsule system when crowded or when I have a mare that we cannot settle with the natural service. I think the main thing is cleanliness and haste, in order to keep the semen at the right temperature. I intend to practice it more this coming season.—J. W. Polson, Kiowa, Kas., Route No. 3.

I believe the capsule system is all right. I bred three jennets to my horse last season with capsules. One of the jennets slunk her colt in January and the other two show to be in foal now.—A. J. Wing, Sunnyside, Kas.

There are so many horses on the stand in this section it is impossible to get business enough with one horse to successfully use the capsule system, but will say that I have used them on mares that would not settle by natural service and have been successful nearly every time in getting them in foal.—C. C. Donner, Melbourne, Ia.

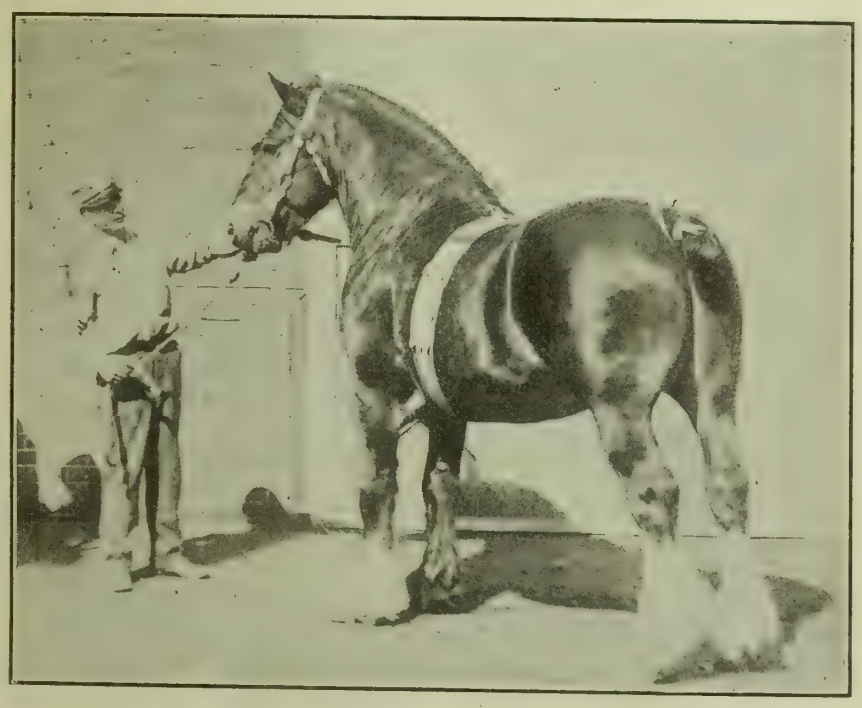
Mares bred by capsule system during 1911 show a large per cent in foal. I do not see how any stallion owner can make a succcss without it, as it is surer, and many more can be bred than by the natural service.—T. H. Terry, Bavaria, Kas.

In regard to results from breeding by the capsule system will say the first mare I attempted to breed that way is now in foal from the first attempt, and all are showing up as well as by the natural way.—H. S. Bryant, Calvert, Kas.

I find the capsule system O. K. in the right kind of hands, but the haphazard breeder would better leave it alone. If a man is on to his job he can settle as many mares with the capsule as he can with the natural service, and sometimes more. I have settled mares with the capsule that I could not settle with the natural service. Cleanliness and promptness is the great secret with the capsule system of breeding.—Valentine Snartzendruber, Hydro, Okla.

So far as my experience is concerned in using the capsule method of breeding I would say that it is all O. K. and gives good satisfaction, both to the stallion owner and also to mare owners. I think mares can be got in foal by the capsule method when nothing else would do the work. —Dr. H. E. McGee, Osceola, Ia.

Yes, I think the capsule is all right, and in fact the surest method. Have had good results.—L. M. Tuck, Morrisville, Mo.



I used the capsule system last year and mares are showing up all right. Had good results.—W. P. Hodgden, Enid, Okla.

Yes, I think the capsule system is all right. A man can do the business with one horse and one jack that it would take more than twice as many; then he saves the expense of their keep. It is a success.—L. S. Leamer, Polo, Mo.

Capsule breeding is all right. I got just as good, if not better, per cent with capsule as with the natural service.—T. E. Collins, Belleville, Kas.

I have used the capsule method for two years with good success. Have got five living colts at one service. Got 71 per cent last year. Think I have beat that this last spring. I have very little trouble. I think if anyone will follow instructions they can make good.—A. L. Hedrick, West Salem, Ill.

In regard to the capsule system will say that it is a success. Any mare in breeding condition will conceive by capsule as well as by the natural service, and in some cases the capsule is far surer than the natural service. I will have several capsule colts this

THE FAMOUS SHIRE STALLION, SURVEYOR,

A Good Buy at $4,000, Because of the Money He Will Earn Through the Help of the Capsule System.

year. Some will be from mares that were considered hard breeders.—T. F. Jalnicke, Mayfield, Okla.

I have had extra good results from the capsule system in the past two years. I have one horse and one jack. Last year I bred up near four hundred mares, which it would have been impossible for me to do if it had not been for the new method of breeding. The past season, in this part of the state, was very hard for mares, especially while the dry season lasted last season, I made but one service a day. I noticed my best day was May 5, when I bred thirteen mares, and nine of them conceived. The improved method of breeding is the only way of breeding. It is a money maker for both the horseman and his customers.—C. H. Livingood, Natoma, Kas.

As I purchased the impregnator late last season, I only had occasion to use it on a few mares. Only used it on one of ours, and she is showing up nicely. There are many advantages with the capsule system and I would not now think of standing stallions or jacks without it.—Leonan Smith, Pine Bluffs, Wyo.

I used the capsule system of breeding last season, and am satisfied it is a success, although I had some trouble in securing the semen. We settled mares with but one capsule that had been bred a number of times by natural service. It is impossible to say what per cent are in foal, as the severity of the winter has caused many of our mares to abort. This being a range country, we cannot estimate correctly.—Ed. McGillivray, New Ulyses, Kas.

We used the capsule system last season and I think we had fair success, but do not know correct results yet.—C. H. Farrand, Dickinson, N. D.

Will say in regard to the capsule system, I used it last year, but not very extensively, with good results. Some mares that I could not get with the natural service I got with capsules. Last year was my first experience, but I got so I could do pretty well. I think the capsule system is all right.—E. M. Starbuck, Fairport, Kas.

Will say that I have had good luck with the capsule system.—C. H. Balding, Anniston, Mo.

I had good success with the capsule system last season, and expect to breed altogether that way this season. I got more mares in foal that had been bred several years with natural service and never was setled before. I think every man that keeps a horse or jack ought to use this system. I would not do without the Carlson semen extractor.—B. F. Monroe, Fairbanks, Ind.

Used the capsule system last season. Had very good success. My greatest trouble was to convince my patrons that it was all right. I bred some mares that had not raised colts for several years, with capsules, and they are with foal. Think I will do better this year.—Ben Richardson, Camden, Ill.

As to the capsule system, my success is good. I can not tell yet what my per cent will be. I have two mares eight and twelve years old that only brought colts every other year. They brought colts last spring. They were capsuled and will bring colts again this spring. I will have to give the capsule system credit for helping me over the "every-other-year" trouble.—F. E. Wagner, Tryon, Okla.

I used the capsule system last year and had good results in settling mares.—C. W. Dixon, Dexter, Kas.

I have not used the capsule system to any great extent, but will say I think it a decided success, and a man with a stallion or jack can not afford to do without it, as he will find cases where he will be obliged to use it to succeed.—D. O. Orr, Topeka, Kas.

I think the capsule system is all right, and I don't have any more trouble settling mares with it than I do with the natural service, and I settled mares that I failed on last year. I bred seven at one service and settled five of them. I have had fair success breeding out of heat. In all I am more than pleased with the capsule system.—J. E. Kennedy, Bethany, Mo.

Having used the capsule system with good success, will say that no progressive stallion owner can get along without using it. It increases the earning power of a stallion by three times, and makes it possible that a stallion owner can handle the best stock that money will buy and realize on the investment. It has its advantages to both the mare owners and the stallioner. If I had to work on the old system I would quit the business.—P. J. Myers, Claflin, Kas.

My success with the capsule system so far has been good. The capsule system, properly handled, will double your colt crop every year. I have as many mares in foal with the capsule system as with the horse, and one thing for sure, I do not know of a mare bred and in foal with the capsule system, as advocated by the Stallion and Jack News (American Breeder) that has lost a colt, but I know of eight that I bred with the horse that have lost so far. I could tell you many more points, but cleanliness in all things is required.—C. M. Tuttle, Onawa, Ia.

I have made a partial success with capsule breeding last season. My chief difficulty seemed to be to get the semen from mares. I think I shall shall make more of a success the coming season, as I have enough mares with foal from capsule breeding to show the mare owners that it is practical. I have got a few pointers on getting the semen from the mares, so I am looking forward to a successful season.—Jason Davis, Fairbury, Neb.

I used the capsule system last season, and as far as I have learned from my patrons my success has been good. I think that is the best way to breed, as it does not work the stock near so hard, and makes them more sure.—J. A. Stiles, Wirt, Ind.

I have used the capsule system one season with entire satisfaction, but I find that I have a prejudice to overcome on the part of some of my customers. Think it will only be a question of a little time until it will be a universal custom. Have been using artificial impregnation quite a while with entire satisfaction. I am never crowded now since I got the extractor and capsules. They can come by the dozens now. Before I got them, I would have to turn the farmers away on rainy days when they overflowed me. I can heartily indorse and recommend the capsule system.—F. M. Fleming, Crestline, Kas.

I did not use the capsule system very much last year, but I met several who had made a success of it at the Illinois state fair last fall, and I think I will use it more this season.—T. A. Penman, Philo, Ill.

I am well pleased with the capsule system.—Geo. Ficken, Bison, Kas.

I have used the capsule system on a great many mares, and find most of them to be in foal. I believe the capsule system is a much surer way than the natural way. I hope to do more of it this coming season.—Geo. S. J. Nixon, Carlinville, Ill.

The capsule system is the only thing to make breeding a success. I had an imported Shire stallion and a jack on the stand last season, and bred 264 mares to the two. I bred them regardless as to whether they were in heat or not. I never used the horse or jack more than once a day. The highest number I bred to both in one day was twenty-two. As far as I can tell so far, the prospect is for a larger percentage of mares in foal than I ever had before. Also I had no trouble to breed wild and unbroken mares with this system.—Jacob Pedrett, Kimball, Neb.

I used the capsule system entirely last season. I could not have handled my trade without it. All the mares are showing up good. I can show capsule colts from mares that were considered non-breeders. The system is no experiment. The experimenting is all done by the men trying to use it without knowing how. Every stallion owner, in justice to himself and his patrons, should thoroughly understand this method. The capsule will always be used at my breeding farm.—Ed. Ferris, Haskins, O.

The capsule system is a success if a man handles it right. The mares that were bred with the capsule system in this neighborhood last spring are showing up well. I have sold my stallion and moved to town. I have but one mare now, and she was bred with a capsule and is in foal. The capsule system is a success.—Geo. Sperline, Sabetha, Kas.

The capsule system is O. K. I find my work very satisfactory. I would not use any other system in breeding.—E. E. Brazell, Franklin, Tex.

I think the capsule system is the only system. In 1910 I bred seven good mares and five of them delivered living colts, one aborted, and the other failed to get in foal. In 1911 I bred 50 mares with capsules and 100 with the natural service, and I have a greater per cent in foal from the capsules than with the old way.—H. A. Highfill, Paragould, Ark.

I have used the capsule system of breeding the past season and it has proved a success to me. I believe that it is the only way to breed mares that are hard to get in foal.—Stanley Berger, Blanchester, O.

Have used the capsules with pretty good success, and expect to use more this season. They are all right.—Gard J. Chase, Albany, O.

I have found the capsule system all that is claimed for it. No man in the breeding business can afford to do without it.—J. W. Timmons, Arapahoe, Okla.

Have used the capsule system as advocated by the Stallion and Jack News (American Breeder) with good success, also the metallic impregnator. Can show capsule and impregnator colts. It is no longer an experiment with me, but has come to stay.—Hugh Graham, Roseland, Mich. Box No. 8.

I got mares in foal with the capsule system that I could not with the horse. Am sure it is surer than the natural way.—T. H. Morgan, Hendley, Neb.

I have used the capsule system of breeding and have found it a success in every way. Out of thirty-two mares bred by the capsule system I have twenty-nine with foal. One of the mares with foal is twelve years old and has not been bred for six years. I have some imported mares and several grade mares and for my own breeding I use the capsules exclusively, as I find them much more sure than the natural service.—Wm. T. Adams, Elm Creek, Neb., R. F. D. No. 1.

I have met with great success with the capsule system. I call to mind one instance when the mare was eight or nine years old and her owner had never been able to make her produce, so I capsuled her without the knowledge of the owner, and now she is safe in foal.—W. S. Browning, Lewisburg, Ky.

Will say that the capsule system is all right. We believe we have had good success.—Holland Stock Farm, Chas. Holland, proprietor.

We have had some success using the capsule system of breeding.—J. A. Kellinbarger, Anselmo, Neb.

I have had splendid success with the capsule system. It enables one to save his stallion by not wearing him out on shy breeders, and when we consider the character of mares the capsule is usually used on, we should not expect to get a large per cent in foal.—C. L. Gay, Rockport, Ill.

As you are interested in my success in using the capsule system of breeding, I have been successful. I have bred seven mares for the same man and they are all with foal.—Henry Laughhellier, Milford, Ill.

In regard to settling mares with the capsule system, will say that I had good results, just as good, according to the number of mares bred, as by the natural service. I expect to do a good business with the capsule this summer.—W. W. Barger, Lacona, Ia.

I have not heard from all the mare owners that we used the capsule for, but some of them was a success all right. Two mares I know, that had been tried for years, we got this season.—G. W. Tanner, Cokeville, Wyoming.

I used the capsule system on a few mares last season. The only difficulty I experienced was in getting the semen. In one case I only got about one-fourth of a capsule full and used it on a mare and got her in foal. Every mare I bred with the capsule, I got in foal. There were seven in all.—D. E. Harvey, Sheldon, Ia.

Capsule breeding is a success. I have used it to a slight extent for the past three seasons with good results.—Jno. T. Adams, Charleston, Ark.

We have had very good success with the capsule system. We have used it on mares at home, and have sent the fluid 100 miles by express to breed a mare at our State Agricultural Society. The thermos bottle was broken and was without artificial heat for about twenty-four hours. They used it, however, and found by placing it under the microscope it still had life. We re-bred the mare in twenty-one days by taking the fluid to Ames in person. The last we heard the mare had refused, but do not know whether the service was fertile or not.—L. H. Picard, Harlan, Ia.

I have used the capsule system but little. I like it and will use it more the coming season.—F. Fruin, Gilman, Illinois.

I have been using the capsule system for two seasons and have had good success, considering all kinds of mares that one has to contend with. I think no breeder can afford to get along without this system, especially if he is crowded.—W. E. Griffith, Nodaway, Ia.

I have used the capsule system and have had very good results. Expect to do better this year.—A. C. Cooper, Center, Tex.

The capsules are O. K. At first I could not get the semen, but had better luck after trying a few times. Had good luck getting mares in foal. Some that I could not do anything with before are safe in foal.—H. M. See, Grigsby, Kas.

Although I am young in the breeding business and have used the impregnator since beginning the business, I can truthfully say that the capsule method of breeding is far in advance of any other way of breeding. I have already noticed that we have settled 25 per cent more mares this last year with the capsule system than we had before by using the impregnator and natural service. Especially do we notice this advance in per cent on the two and three-year old mares. Another important feature is the number of mares that can be bred at one service. I only breed once a day and last year I bred as high as eighteen mares a day, while before with the impregnator I never tried to breed over four mares at a service. The highest number of mares I have bred with one service is six, although I could have bred as many more if I had been given the mares.—C. L. Graham & Sons, per Roy E. Graham, Whiteland, Ind.

BULLETIN FOR IMPORTERS.

Bureau of Animal Industry Order 186 was issued January 18th, giving full particulars to those interested in importing live stock into this country. It supercedes all previous regulations on the same subject. It was effective February 1st, 1912. All interested in importing live stock should send and get this bulletin, which may be had by addressing the Secretary of Agriculture, Washington, D. C.

There is an important announcement on the back page concerning your subscription to the American Breeder. Read it.

Recognized Record Associations I

Information From Which a Breeder May Judge of the Genuineness of a Registry Certificate. The American Belgian Record. History of the Breed in Europe.

Every one interested in improved live stock should be familiar with all reliable record associations. There are some bogus record associations that have no value, but with names similar to those of some recognized associations, an arrangement likely to confuse if not to actually deceive the public. The names and officers of some of the recognized associations have been changed, which adds to the difficulty which the average breeder experiences in distinguishing at all times between the good and inferior associations.

Beginning with this number of the American Breeder we will give in each issue the names, rules of entry and other particulars concerning at least one recognized association. In addition we will give the names of all the secretaries who have signed certificates in such records. This will make it possible for our readers to know when a registry certificate is genuine.

The American Association of Importers and Breeders of Belgian Draft Horses.

The Belgian importers and breeders formed an association on the 25th day of February, 1887. Mr. Harmon Wolf was the founder of this registry association and was its president for many years. Three volumes of the stud books have been published. Mr. J. D. Conner, Jr., was the first and only secretary of this association. He was recently elected by acclamation to continue as secretary of this reliable association. Mr. Conner is very careful in recording Belgian horses. He will not admit the use of a typewriter but continues to write the certificates with pen and ink, giving as his reason for doing this that it would be difficult for a certificate to be changed under this method. Any certificate for Belgian horses, purporting to be registered in America, and not signed by J. D. Conner, Jr., as secretary, should not be accepted as a recognized certificate.

The address of both Henry Wolf, president, and J. D. Conner, Jr., secretary, is Wabash, Ind. The present rules of entry and transference are as follows:

Article III—By-Laws.

Section 1. All horses imported from Belgium into the United States prior to January 1, 1888, may be entered in the Register of the American Association of Importers and Breeders of Belgian Draft Horses, provided application for their entry shall be made, or shall have been made prior to January 1, 1890; satisfactory proof of which, with the name of the importer, the name of the vessel, the port of entry and date of importation, shall be furnished the Secretary.

Sec. 2. No horse imported from Belgium into the United States after January 1, 1888, shall be eligible to registry in the American Association of Importers and Breeders of Belgian Draft Horses unles the same is registered in one of the following Belgian Stud Books, viz.: "Societe Des Eleveurs Belges," of Liege, Belgium; "Societe National Des Eleveurs Belges," or "Societe Le Cheval de Trait Belge," of Bruxelles, Belgium, which registry shall be certified to under the seal of the respective Secretary of the Stud Book in which the same is recorded except horses imported in dam.

Sec. 3. No animal shall be entitled to record except imported horses, as set out in sections one and two in this article, and native full-blood horses.

Sec. 4. A native full-blood is declared to mean an animal bred in the United States and tracing its origin to registered sire and dam recorded in the American Association of Importers and Breeders of Belgian Draft Horses.

Sec. 5. All applications for registry in the American Association of Importers and Breeders of Belgian Draft Horses shall be certified and sworn or affirmed to before some officer authorized to administer oatns, on blanks furnished by the Secretary, except applications for registry of animals imported after January 1, 1907.

NOTE—Application for the registry of animals imported in dam, must be sworn to and accompanied by the certificate of service signed by the owner of the sire.

Article IV—By-Laws.

The fees for registering and transferring horses in the American Association of Importers and Breeders of Belgian Draft Horses shall be as follows, to-wit:

Section 1. The fees for registering horses and mares shall be as follows: To members, $3.00; to non-members, $6.00.

Provided that, as a penalty, the said respective fees shall be doubled for the registry of all animals the application for whose registry is not filed with the Secretary and the fees for the same paid within one year from the date of importation in the case of an imported animal, and within one year from date of foaling in the case of a native bred animal. Said rule to be in effect on and after June 2, 1908.

Sec. 2. For transferring, shall be one dollar to members and two dollars to non-members, of every animal transferred.

Article III—Constitution.

Membership—The membership of this Association shall consist of such persons as are approved from time to time by the Executive Committee, and shall pay to the Secretary the initiation fee of $10.00.

History of the Breed in Belgium

Written for the American Breeder, By Chevalier Hynderick de Theulegoet, Brussels, Belgium.

In 1878 I was named a member of the jury of the exposition of Paris. I was assigned for examining the draft stallions. This class included Boulonnias, Percherons, Clydesdales, cart horses, Suffolks and finally a few Belgian horses. All the first prizes were at the disposition of the jury. It awarded one of them to Brilliant, the property of Remy Vanderschueren The other representatives of Belgium were frankly defective. The second prize, however, was given to a Limbourg horse, belonging to a Mr. Van Schoenbeke.

INDIGENE DU FOSTEAU (29718).
First Prize, Waereghem, 1904; First Prize, National Horse Show at Brussels, 1905; Champion Belgian, 1906, 1907, 1908 and 1909.

In examining our horses and seeing their lack of character, I decided it was urgent to look to the amelioration of the breed, in order to avoid a desperate situation. I communicated my impressions to Count Adrien Oultremont and to Mr. Paul Tiberghien, and they shared my point of view, and engaged me to study this question. After having looked it over I decided to found a society whose aim should be the amelioration of the draft horse in Belgium, creating a new type, which should be the Belgian horse, and as a means toward that end would be the Stud Book and the annual exhibition.

The first meeting was held in 1885, after the exposition of Anvers in Brussels, and the idea which I presented was adopted. The situation was particularly happy, for a movement was spreading far over the country in favor of the amelioration of agricultural horses. The Belgian breeders, with headquarters at Leige, joined us with Hippique, which undertook the publication of a stud book of native horses.

But before tracing the work of the society which is celebrating its twenty-fifth anniversary, let us take a look at the breed of draft horses as they existed in our country. The wars of the revolution and the empire were sad blows to the condition of horses in Belgium. Requisitions were made on stallions and other horses alike, and brought about a sensible decline in the number and quantity. Under the reign of William I. the government began to take an interest in the betterment of the species.

The dark ages in the history of the horse began in 1834. It was not the open war against national breeding but was worse—prejudice and persecution. The stables of Turvueren had about sixty-five stallions including pure bloods and half blood Percherons and Arabs, which had to serve in ameliorating and bettering the Ardennias, which were the stallions of a race entirely unknown. They had official documents calling for the "Russian breed of the mountains," at the time of the description of the stable budget in 1835. A member of Parliament proposed to introduce in our breeds a large infusion of Arab blood. Another preferred the pure English breed. The minister declared that it would be necessary first to employ one-half or one-quarter bloods. Several members demanded whether it was worth while to try to modify the draft horse, considering that that breed would soon disappear on account of the railways, canals and better roads. M. Roy Blicquy, president of the Agricultural Society of Hianaut, organized the farmers of that province in replacing the draft horse for agricultural work, by one-half bloods, and advised breeders to abandon the ancient race which would soon be worthless. These facts explain the hatred breeders of draft horses have for the supporters of other breeds. The long discussion given to this movement was alone to blame, and it finally brought about the radical modification of the practice. Our breeders of draft horses still remember the mistrust which buyers had for them when they put forward what was then called a horse of first and second crossing. One understands, considering the movement that is still active in Belgium against the breeding of the half blood.

The production of the draft horse was left to the provinces which were free to act as they pleased. Luxembourg, Limbourg, Liege, West Flanders, Namur and Brabant favored the importation of Percherons and Boulonnias stallions, and it needed all the vitality of our own breeds to withstand such attacks. These practices stopped in about 1861. Gaynot, one time stable director in France, writing in 1876 mentions the following varieties in Belgium. "Flemish, Brabancon, Hesbignon, Condruzien, Ardennais, Hennuyer and Borain."

In reality there only existed two distinct races, the Flemish on one side and on the other a race from which all others were derived. The first whose area included West Flanders and Zealand had lost much of the qualities which contributed to its renown in the Middle Ages.

An English amateur, Burke, speaking of breeding in Belgium in about 1860 said that the Flemish horse had become about the worst in the world, that they all had large, flat feet, narrow hips, knees all out of proportion, good skin but head without expression. This writer attributes the degeneration of the race to the great drain made on them by the English since 1836 for the encouragement of the English breed called the black horse.

Dr. August Voelcker and M. H. M. Jenkins, in their report on Belgium agriculture in 1870, said that the "pure flemish horse once so celebrated, is no more to be found in the firms of West Flanders. One finds, however, a horse which is a cross with the Boulonnais and very inferior." If I understand this subject aright our society has suppressed this useless type and has replaced it by a horse which gives new luster to the Flemish breeders.

The editor of a live stock paper writes in 1908 recalling the precarious condition in which horse breeding found itself in West Flanders, and the surprising progress realized in the last twenty years. He does not hesitate to attribute it to the beneficent actions and united efforts of the Belgian Draft Horse Society.

The other sub-races of Belgian horses are descended from the horses of the Meuse, whose skeletons are found in the Quaternaires caverns. Its evolution explains itself in a very simple way. I will quote from the text of Prof. Leyder: "The undulating plains of Condrorz and Lesse extends from Dinant to Leige, along the right bank of the Meuse with an

average breadth of forty kilometers. This may be considered the place of the origination of the Belgian horse. From there a branch emigrated in the night of prehistoric times toward the east, ranged the mountains of the Ardenna, where at a high altitude, a rough climate, a weakly and fitful sun, there was offered only precarious conditions of existence, which produced a sub-race, Ardennais. The other branch crossed the Meuse, and the plains on the west, where the low and fertile base of the Beligue spreads itself and developed the sub-race, Brabancon. Between these two races there is an intermediate sub-race, Condruzein. The correctness of this conception had its best proof in the astonishing rapidity with which has been realized homogenity of our horses from the Ardenna to the shores of the North Sea.

"Since then in effect, it has been by spontaneous manifestation of avatism, retarded by the mixture of so much foreign blood, that the selection has been able to be produced in such a short time and with such remarkable uniformity of breed."

The principal end of the society has been attained. Beyond that there are two things that it wanted to do—produce the heavy draft horse and the light draft horse. But here economic difficulties came up and made it necessary to keep the name of Ardennais for certain classes in competitive exhibits.

The annual show has been recognized regularly since 1886, and inspired by the example of England has stimulated the care of a national breed in the most careful manner. It has hastened the instruction of breeders and has awakened in them an emulation which impels them to make their stables the best to be found anywhere. Today our horse show is a great event for the whole of Beligium.

Thanks to the action of the society, the sale prices have come up very much latterly, to such a point that a cry of alarm has been heard in Parliament. The society was accused by the National Tribune of having caused too many horses to be exported. The executive committee of the society considers this the highest praise it could receive. It is persuaded that the more horses the foreigners buy the more Belgium will produce. The creating of conservative prices has assured also the maintenance of good breeding stock in the country.

There was still another thing to be done. The agents of the committee on breeding, those of the agricultural department, joined with the control of the provincial council and a uniform law was adopted for the whole of Belgium. It is in effect since 1901 and has contributed largely to the excellent progress of Belgian horse breeding.

The first stud book published by the society has 6,469 inscriptions. It had its defects and the society did not hesitate to rearrange the genealogical tables on the new plan. A commission especially charged with this work put it into the form which it has held for twenty years. All the criticism of the book came from Belgium it should be noted, while abroad it was compared with the best foreign publications and said to contain the minimum of errors.

The administration of counsel of the society is composed of sixty members elected by the provinces. The stud book is discussed at each of its meetings and changes are made according to a wisely progressive policy. After various experiments a system of inspection has been found which gives excellent results. The country will admit without doubt that the members of the council are among the most competent and they are animated with a desire for general success. The best defense of the stud book is that there never has been any unpleasantness concerning it with foreign dealers, and especially with the United States. All trans actions in the registry of horses has been marked by a considerable increase in the last few years.

An interesting question has been raised in the last few years. Is horse breeding in danger from the introduction of the motor car? Mr. Ruau, minister of agriculture in France, replying to a question of a member in the Chamber of Deputies, declared that the districts in which there was much breeding had felt no effects at all. Mr. Stuart-Heaton in the jury of the Royal Agricultural Society of England, gave the following opinion:

"Breeds of draft horses have in no way been affected by the introduction of the automobile, and unless the present system of traction changes completely and is considerably bettered I do not think we need have the least apprehension for the best breed of draft horses in England. The greatest firms which adopted the traction engine have found it useful to replace a certain number of heavy motors by horses. The heavy road trucks, at present in vogue, give good service for long distance, but for short ones or for wet and stick pavements in industrial towns and on earth roads, the motor does not give satisfaction. Also it demands a considerable initial capital and expensive and constant up-keep, and the depreciation is rapid.

It is well to recall the services that the expert committee has rendered in the amelioration of Belgian horses, for that committee has for many years perfectly understood its business and fulfilled it. All of them since the law of 1901 have got on the general road of progress. The following figures show the exportation of horses from 1900 to 1909:

1900, 23,015; 1901, 21,890; 1902, 24,949; 1903, 26,551; 1904, 27,658; 1905, 29,631; 1906, 28,666; 1907, 26,555; 1908, 26,012, and 1909, 28,400.

These figures have their eloquence when it is remembered that the equine population of Belgium is only 271,227. Putting the raise in the price of horses at two francs a head—and it has been considerably more—one can realize by this table what enormous value has been gained in Belgium in the last twenty-five years. This in itself is a fine title to glory and would be sufficient in itself, but the name of the society is also inseparable from the recent successes of the Belgian horse, especially those obtained in Paris in 1900 which has brought our national breed to the first place in draft horses.

WRONG ENTRY.

There is frequently much damage done at a service by making the wrong entry. This usually happens on mares where the rectum is sunk in. The attendant should make an examination of all mares on which the stallion or jack are liable to make the wrong entry. The arm should be inserted in the vagina so that the entry can be easily made. When the stallion or jack mounts, the attendant should insert three fingers in the top of the vulva with the back part of the hand covering the rectum. Then the entry will be easily made. This can be done even in cases where the stallion or jack has not been educated to have anyone guide for them.

The injury from a wrong entry depends largely on the condition of the bowels. If they are empty there is not much danger, but should they be full a rupture might follow. If a wrong entrance is made and the head of the penis has expanded, it is usually safer to let the stallion or jack complete before withdrawing. If the attendant is afraid that a wrong entry might be made he can easily empty the bowels so that there will be very little danger.

There is an important announcement on the back page concerning your subscription to the American Breeder. Read it.

Capsule Breeding Questions

Is it necessary to put a capsule back in the mare that has been served by the stallion or would there be enough semen left in the mare to cause her to get in foal?

The mare that was served by the stallion should have a capsule inserted in the uterus. A great many services are made in the vagina and the semen may not find its way into the uterus. The breeder might forget where he obtained the semen. It is better to make a practice of putting the first capsule back into the mare which the stallion served.

The threads on the soft point of my semen extractor will not hold. How can I have it fixed?

Take it to a tinner and have the point soldered on. The threads will hold if the point is not screwed on too hard, but if it is screwed on too tight the threads are liable to be spoiled. After it is soldered you will not have any further difficulty.

Will any kind of capsules do for horse breeding, and what size is best to use? Is it necessary to keep them clean?

Many failures are due to using the wrong kind of capsules. There are hundreds of different kinds of capsules on the market. The Kansas City Impregnator Company has gone to the expense of manufacturing a special pointed capsule—the only kind manufactured especially for breeding. These capsules are pointed so they are more easily inserted. We would advise our readers not to use any other kind. These are mailed in a tight box. The capsules must be kept absolutely clean. They must not be allowed to be in the dust or handled by anyone whose hands are not thoroughly washed with soap and water. Always keep the lid on the box and keep it tight.

What kind of mare should be served by the stallion to get semen to fill the capsules?

Select a tall mare when using a stallion as the best services are made on these mares. She should be gentle and absolutely free from all disease. If there is any discharge from the vulva do not use her for the natural service. A mare with a colt nine days old, if she has cleaned nicely, will not be diseased.

When is the proper time to try mares back when they are bred with a capsule out of heat?

Mares bred with a capsule when out of heat should not be tried back for thirty days and then once a week for three weeks, as they are liable to show a heat period before thirty days.

Do you fill all the capsules at once, or just fill them as they are used?

Only fill one capsule at a time and use it immediately. Do not have the mares too far from your breeding room, as the capsules will collapse in about two minutes. After the capsule is filled one must work rapidly. All mares should be examined before the service is made. All tight mares should be opened up so that the capshule can be inserted quickly.

Is there any danger in getting the egg of the mare while extracting the semen from the uterus?

There is no danger in getting the ova from the mare as fertilization takes place in the fallopian tubes in the mare. The egg is not released into the uterus for from two to three days after the heat period has closed. Thousands of mares have been used, and the semen taken out of the uterus to breed jennets. No one ever heard of a jennet producing a horse, and neither has anyone heard of a mare producing a jennet.

Will I need a thermometer to tell when water is the right temperature or will it be right when it is not too hot to hold my hand in it?

You will need a thermometer by all means. If the water gets hotter than 101 degrees the spermatozoa is liable to be cooked, and you cannot expect any results. Watch the thermometer closely and regulate the heat, so that it will not get too hot. Remember that the semen should never be above 101 or lower than 95 degrees. Semen will live a great length of time in temperature as low as sixty degrees, but it will not fertilize.

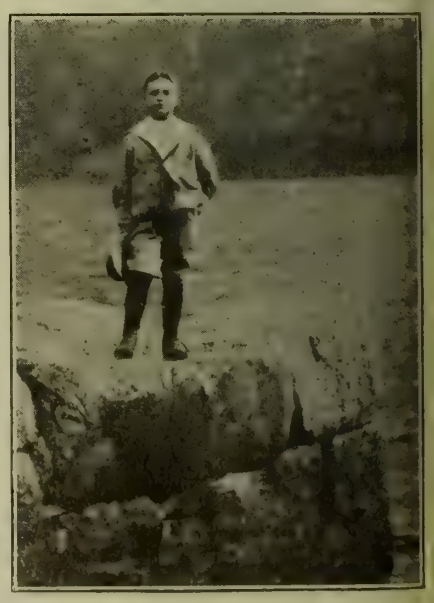
Can a curved metal impregnator be used for getting the semen out of the uterus to fill capsules?

The curved metal impregnator has no value as a capsule instrument. The Carlson Semen Extractor is the only instrument of any value for capsule breeding. There are several imitations that look very much like it, but they are made to sell and not to use. The Carlson Semen Extractor has been tried and found successful.

Can the average horseman use the capsule system successfully?

There are thousands of breeders using the capsule system with success from the rules which have been printed in this paper. The rules must be complied with. We would not advise any breeder to experiment the first year, until he has thoroughly established himself as a capsule breeder.

IODINE BARREN MARE TREATMENT.



Many requests have been made for this treatment. It will be published in full in the April 5 Barren Mare edition, with some new improvements over the method which was printed last season. Be sure and watch for the April 5 edition and file this issue away for future reference.

HORSES IN HIGH ALTITUDES.

We would like to have some of our Western readers give their experience in shipping horses from the corn belt into the mountains, stating whether this interferes with their productive power and how long it takes for acclimation. A great many fine horses have recently been shipped into the mountains, and the actual experience will be of much service to others. This should apply to all kinds of breeding stock.

THE YOUNGEST DRAFT HORSE IMPORTER.

Omer Singmaster of Keota, Ia., son of J. Omer Singmaster and grandson of Charles F. Singmaster, Sr., is the youngest draft horse importer in America that we know of. He is 8 years old, and the records show that he has been importing Percherons for three years. There is another record

THE YOUNGEST IMPORTER.

connected with this which shows that there are three generations of Singmasters now actively engaged in importing Percherons. The writer spent considerable time with Omer Singmaster and his folks in Europe last summer and he seemed to be very much interested in Percheron horses, which is probably an hereditary tendency.

The American Saddle Horse

Something About the Characteristics, Accomplishments and Antecedents of the Horse Most Prominent in the History of Kentucky, Missouri, Virginia and Tennessee.

Written for The American Breeder
By Prof. J. J. Hooper, Department of Animal Husbandry, Kentucky State University.

THE American saddle horse is the most beautiful and the most versatile horse that is bred in America. He has a majestic bearing that at once commands the respect and admiration of the audience at any horse show where he is exhibited. He may be used under the saddle as a plantation or farm "walking horse" that will convey the proprietor over his acres of land, or he may be used as a five-gaited horse upon the road, or still again he may be employed as a park horse of three gaits. But his usefulness does not stop at his saddle attainments, for he makes the best of road horses, and has considerable speed when hitched to a light vehicle, and some of the highest priced horses that have worn heavy harness, and that ever pulled a heavy carriage, have been recorded in the Saddle Horse Register.

Of course not every individual included in this extensive breed can

MARE THAT BROUGHT $2,100.

perform all of the services suggested above, but every individual may bear the saddle and also become a driving horse. The history of the horse is closely allied with the history of the people of Kentucky, Tennessee, Virginia and Missouri. The best strains of the Thoroughbred and Morgan breeds were drawn upon, and during more recent years, some fusion of trotting horse blood has taken place.

The Denmark family descend from Denmark, a great race horse, which was sired in 1839. The fine fluted bone, large, prominent eye, thin, curving ears, and sloping shoulder all came from the race horse. The sons of this family of recent renown include Highland Denmark and Chester Dare (both by Black Squirrel) and Kentucky's Choice, and a long line of other brilliant show horses. The "Chief" horses, as they are known in Kentucky, trace their lineage to Harrison Chief. He traces to trotting strains, being by Clark Chief, he by Mambrino Chief (II), one of the sources of the trotting horse breed. Bourbon Chief, the most illustrious son of Harrison Chief, was the sire of the World's Fair winner, Emily. Goodwin, a prize winner, was out of Emily and by Highland Denmark. Bourbon Prince, a consistent prize winner, was by Bourbon Chief and out of Rose Scott, a Denmark mare. Star McDonald, a horse with a long show record, traced to both the Denmark and Chief families. These striking examples are given to prove how well the two families of saddle horses nick when mated together. By thus crossing the Denmarks and Chiefs some of the most useful saddle horses of today have been produced. Among the straight Chief bred saddle horses are included such world famous show horses and sires as Montgomery Chief, Bourbon King, Golden King, Marvel King, Astral King, and among the mares, Golden Butterfly.

At an early date in the history of this part of the country, the roads were rough, and bridle paths were the only lines of communication in many districts. Naturally, therefore, the saddle horse was used extensively, and the people began to select the easiest gaited horses. The following stallions were sires of this easy gaited kind of horse, and they were admitted as foundation stock in the establishment of the American Saddle Horse Breeders' Association: Denmark, Thoroughbred; Brinker's Drennon, by Davy Crockett; Sam Booker, Thoroughbred; John Dillard, by Indian Chief; Tom Hal, imported from Canada; Coleman's Eureka; Vanmeter's Waxy; Cabell's Lexington, by Gist's Blackhawk; Copperbottom, pacer; Stump the Dealer; Texas; Prince Albert; Peter's Halcorn; Varnon's Roebuck, a Missouri horse; Davy Crockett; Harrison Chief; Pat Cleburne, by Benton's Gray Diomed. This list of names will be of little interest to most of the readers of this article, and we will pass it with the statement that they bore Thorough bred, Morgan and trotting horse blood.

On April 7, 1891, the breeders of this popular type of horse assembeld in Louisville and organized the American Saddle Horse Breeders' Association, and in volume four of the registry books, which was issued last fall, the numbers run up to 7,500. We understand the fifth volume, including some 3,000 head additional, is nearly ready for distribution. These numbers show that the breed is increasing in size rapidly, and the owners of these horses are located in various parts of North and South America.

The saddle horse of today contains the amalgamation of many lines of blood, and naturally we should expect that there would be a wide variation in the type. That there is such a variation is evidenced by the fact that occasionally we find a show animal that is short coupled, short legged and in every way short and stocky. On the other hand, we find also saddle horses with exceedingly long, swan-like necks, light middles and long legs. The breeders have performed splendid work in unifying the type, by securing a happy medium between the types just referred to, and after careful observation we think that there is equally as great variation or more varieties in type between representatives of nearly every other extensive breed of horses.

From February 13 to 17, inclusive, a large public sale of horses was held at Lexington in the sale barn of Harbison & Co.; 395 trotting and saddle horses were sold for $128,375, an average of $325 per head; 158 saddle horses were auctioned off, and the first day 88 of these were sold under the hammer and brought $37,315, an average of $424 apiece. The next day 70 head sold for $17,950, an average of $256 per head. The entire 158 saddle horses averaged $350 per head. This is good proof that the saddle horse is not waning in popular esteem.

The mare, Golden Glow, whose picture is shown on this page, brought $2,100, and Highland Cloud, a stallion, sold for $1,300. The sale included youngsters, debutantes, aged matrons, stallions and geldings.

That the saddle horse is well fitted for cavalry mounts, was abundantly proved by the splendid service performed by the army horses during the Civil war. The marches made by the Southern cavalry were remarkable. The generals with Morgan when he rode into Ohio have stated that the Kentucky horses bore their riders through that march without any mishaps, while Ohio horses that were captured and ridden, broke down after one day's forced marching. Some of the Kentucky horses brought their riders safely back into Confederate ranks, and were ridden with other horses similarly bred throughout the war, and at the end of that time many of them served long and faithfully in the stud and upon the road. It is claimed by army officers now that they object to the "ambling" horse, because he exhausts both himself and his rider, when ridden in a company for days or weeks. This is probably true where he is accompanied by ungaited orses, that travel in a walk, and trot.

But his record as a cavalry horse has been established beyond compare, and army officers purchase large numbers of such horses in this territory each year.

As a park horse he is unequaled. When ridden in the parks the horse is trained to walk, trot and canter. His tail is docked and his mane pulled to make his neck look trim. As a five-gaited horse he is expected to perform the flat footed walk, the stepping pace, or the running walk, or the fox trot (most high class racking horses perform the stepping pace) and the trot, rack and canter.

The "Plantation Horse" is usually not such a beautiful horse as the two preceding types, and when he performs the running walk, which is his peculiar gait, he nods his head, and keeps time with his ears. Such a horse will carry the rider all day without fatigue to the rider or to the horse.

The horse is taught to perform each gait at the command of the rider. The double rein bridle is used on a high class saddle horse. When walking the horse is taken gently on the snaffle bit. To go into the slow gait the snaffle is loosened and a slight pressure is put upon the curb bit, and to travel faster in the rack, the pressure on the curb bit is slightly increased, and the knees are pressed firmly against the saddle, and the heels of the rider are gently pressed toward the flanks. The horse will understand what is desired if he is well trained and will respond with the four beat gait, known as the rack. This is the most delightful riding gait possessed by any horse on earth, if the rider is expert enough in horsemanship to appreciate the fine qualities of the gait. But inasmuch as one foot only is placed upon the ground at a time, it is rather hard upon the horse, and should be made use of only on level road, and should not be prolonged too greatly.

A good racking horse should go up against the curb strongly, but should not be a puller or lugger by any means. The horse may be brought from the rack, through the slow gait to a walk. Then if the trot is desired, a gentle pressure is exerted on the snaffle, the crop is used to urge the horse forward, and as he gains speed the rider should post, that is, rise in the saddle. If the horse is well trained he will go off in a square trot. The Kentucky trainers have long since stopped the practice of pulling on an ear or the mane to indicate that the trot is wanted.

Now for the last gait, and the gait in which the saddle horse excells all others, the canter. This is not a slow run or gallop. It is a graceful, springy gait, that is performed perfectly by but few horses. To cause the horse to perform this gait the rider takes the horse in hand at a walk, takes him lightly on the curb, leans a bit forward, and salutes the horse with the right hand. The salute means that the right hand is raised upward. The horse will understand, if well trained, and will immediately bound off into a canter. In the proper canter the lead foot may be changed by the rider, and the feet on the same side of the horse should move in unison. A cross footed canter is rough.

A book could be written regarding the attributes of this beautiful, useful, versatile equine. We have endeavored in this article to present a few of his attributes, and if we have succeeded in winning a few new friends we shall be greatly pleased with our effort in behalf of our favorite.

AS A BREEDER KNOWS THEM.

Written for the American Breeder,
By James Houchin, Jefferson City, Mo.

When we speak of saddle horses we might refer to any one of three kinds of saddle horses.

One is the business saddle horse, usually called the walking horse. These horses are usually a little coarse and not as symmetrical in finish as either of the two clases to which we might refer. He is usually a horse of little action, and not having finish and action he is educated to one gait, principally, and that is to walk.

These horses will carry their riders six to eight miles per hour and do it all day long. A good walking horse rarely does any other saddle gait, in a satisfactory manner, though there are exceptions. My experience is that most any saddle bred horse will make a good walking horse, but

A KENTUCKY WINNER OF 31 FIRSTS AND SIX SECONDS.

the horse of action and finish is usually gaited, and the coarse finished horse only educated to walk. But after you learn one of either class to be a good walker, you had better be satisfied, because to mix the other gaits with his walk, many times spoils the latter.

Now as to the three gaited horse. It is claimed that once a horse is educated to rack he never has the same bounding, elastic trot. There is probably some truth in this. I have known a few horses that could not or would not rack. I doubt if these horses ever have the same mouth and the same step at the trot, after a trial to make them go the five gaits. The three gaited horse is usually a horse of higher style and more finish than either of the other two classes, but not necessarily so. I think custom has made this so. Long range of neck, fine head, good hock, action at both ends, and Mr. Owner

usually says, "a walk trot type," when the horse would probably take to the five gaits as well as three.

This class of horse finds a ready sale in the Eastern market, and the demand for good ones is far in excess of the supply.

Now as to the five gaited horse. Most any horse can be taught the five saddle gaits. I have known Standard bred horses to do the saddle gaits nicely, but the strictly saddle bred horse does them more naturally. He has it in his blood and therefore in his brain. The more style and finish in your five gaited horses the higher the price you can put on him. The great trouble today is that breeders use indifferent mares, and cheap stallions. The best pays always, and you cannot get them too good, and you cannot put your price so high on a good one that some man will not meet the price.

Saddle horses in general may be considered all purpose horses. Ride, drive, work on the farm, and any work that a twelve hundred pound animal can do, your saddle horse will do and do it a little better and with so much more satisfaction. You have a better opinion of yourself when riding or driving a handsome saddle bred horse than one of the mongrel breed, or a mule. The saddle horse possesses great energy and ambition and he will move about and get to the other end of the field without the aid of a whip, and this counts in these days of high living.

If you are breeding saddle horses, get the best mare you can buy and use the best stallion you can reach and you will find that it is a paying investment as well as a very satisfactory one.

THE BLOOD OF OUR SADDLERS.

To the American Breeder: Seventy-three years ago, on Kentucky soil, there came to light a stallion colt given the name "Denmark," and got by imported Hedgeford, the foundation of the Denmark family and a thoroughbred. This stallion was bred to a fine and easy gaited mare known as the Stevenson mare, and produced Gains' Denmark. By careful selection and mating he produced Washington Denmark and Diamond Denmark. Through Washington Denmark we got Crigler's Denmark, the sire of the great Rex Denmark 840, the sire of the retired champion, Rex McDonald, and others.

Diamond Denmark, the other son of Gains' Denmark, sired the famous old Montrose 106, champion of his day. Other noted descendants of this foundation horse, Denmark, are Black Squirrel 58, Artist 75.

Through the best sons and daughters of the above sires, by scientifically mating with other strains, we have produced the most beautiful as well as the most useful horse in the world. No other breed has been bred to carry their heads and tails up like a peacock, standing still or in motion —a horse that is not only a saddler, but can do heavy work on the farm and in light harness show speed and action at the trot. He is the only one that can fill those three places with any degree of satisfaction.

His graceful movements going the gaits under saddle, with ease to himself and comfort to his rider, make him attractive to the most fastidious, and the demand is becoming greater than the supply, as horseback riding is increasing in popularity each year in the cities. It is the greatest exercise for health as well as a source of pleasure. There will be such a demand that prices may soar beyond all comprehension.

As to the value of the saddle cross, the more style and finish you can get on your harness horse the greater the value. Some of our greatest show horses of today, both in harness and under saddle, are a cross of the trotting horse with the Denmark saddler.—Dr. W. E. Cheatham, Excelsior Springs, Mo.

Southern Farms Need Drafters

Percheron Mares Work Through Eastern Texas Summers Without Difficulty. For Steady Farm Work They Are More Economical of Feed Than the Usual Work Stock.

Written for The American Breeder,
By Prof. John C. Burns, Texas Agricultural and Mechanical College.

THERE is a general opinion among Southern farmers that the draft horse is not adapted to Southern conditions, particularly that animals of this type are unable to do good work on account of the long period of hot weather. The mule has long been considered the animal best suited for draft purposes in the South, and though we must concede that this animal fills his place well, yet there are many arguments in favor of having more draft horses on Southern farms.

In the first place, it is largely opinion rather than fact about horses of the draft breeds being unable to withstand the Southern climate. If they be placed in the hands of ignorant, careless drivers, trouble will likely result. The mule seems better able to withstand poor management and ill treatment than the horse, and hence in cases where only the average negro laborer is available as a teamster, it would hardly be advisable to use draft horses. On the other hand, the intelligent driver and caretaker can use the draft horse with great advantage.

As an example of the adaptability of draft horses to Southern conditions, we may take the experience of the A. and M. College of Texas, (located in the east-central portion of the state), with a pair of pure bred Percheron mares.

These mares were purchased in the winter of 1908 from a breeder in Kansas, when they were 2-year-olds, weighing about 1,300 pounds each. They were only halter broken when they arrived at the college in the early part of January. Being immediately put to the collar, they were worked from the start without giving the least bit of trouble. It would hardly be possible for any animal to take to harness any more readily than they did. They were used for heavy hauling, breaking land, cultivating, and such work as any farm horse or mule would have to perform. They were worked through the hot weather, though special precaution was taken at this time, as it was expected that the first summer would go rather hard with them. As it was, however, they went through the summer in good shape and have been worked steadily since without receiving any more care or attention than would be received ordinarily from any good teamster, whether his team be horses or mules. These mares, weighing now in their mature stage about 1,550 pounds each, have not only far surpassed the average pair of mules in the amount of work they have accomplished, but the fact that they have produced offspring is a very important advantage in their favor that should not be lost sight of.

An argument often advanced against the heavy horse is that it requires a larger amount of feed to maintain it than it does to maintain the light horse or mule. This is true, but it is also a fact that the extra amount of feed required by the draft horse is not in proportion to the larger amount of work it can perform. A pair of draft horses weighing 1,600 to 1,800 pounds each can perform a given amount of farm work more effectively and more economically than two pairs of light horses or mules, weighing from 800 to 900 pounds each. Less feed will be required, less harness needed, and less work involved in caring for the two heavy animals than for the four light ones. Weight, made up largely of good bone and heavy muscle, is one of the most important qualifications for an animal that must draw heavy loads. In order to exert great power in the collar, the animal, whether it be a horse, mule, or other beast, must possess weight. Therefore, in doing heavy hauling and in pulling heavy farm machinery, the draft horse has marked advantage over the light horse and light mule.

If the draft animals used be mares, they have the further advantage over mules in being able to produce offspring, a matter which the farmer should consider of much importance.

One of the greatest arguments, however, in favor of more draft horses in the South is the great need of producing larger and better mules. Every farmer knows that a large, heavily muscled, smoothly turned mule will sell for a good round price without much effort on the part of the salesman. Such mules cannot be produced from light Thoroughbred, Standard bred and native mares. Very few of this character are produced in the South, from the fact that mares of the right type from which to produce them are not available. Such mules are the products of mares having a large percentage of draft blood, bred to high class jacks.

The question of procuring good draft mares is not an easy one. They are scarce all over the country, and even in the North comparatively few are changing hands. The solution of the problem for the South must be the mating of good, sound, registered draft stallions to our native mares, and thus, by a grading up process, furnish a foundation from which either mules or horses may be produced that will fit into the highest market classes.

The farmer should have a definite purpose in mind in his breeding operations and should work constantly towards its accomplishment. He should strive to produce animals that will grade high in the foremost market classes. Such animals are in demand and will bring the top prices, while misfits are often hard to sell at any price. Many farmers have mares with an infusion of draft blood, which if bred to a good draft stallion would yield a good marketable animal. They make the mistake, too often, however, of breeding such mares to a representative of one of the light horse breeds, with the expectation of getting a fancy driver, or a saddle horse. The result is that they usually obtain a misfit—an animal that does not possess the qualifications for any recognized market class.

When it is considered further that the draft horse may be turned off ready for work at an early age, without having demanded any previous training or mannering, whereas much time and labor is usually involved in properly training and mannering the light driver or saddle horse before it can command a reasonable price, it is apparent that the raising of draft horses is better suited to the average busy farmer.

Horses of the Clydesdale and Shire breeds are not likely to become popular in the South, on account of the long, thick hair on their legs. On the other hand, there is no reason why the Percheron, Belgian and Suffolk Punch breeds should not prove well adapted to Southern conditions. In fact, where good individuals of these breeds are being given the proper opportunity in the South, they are giving good results.

BELGIAN SPECIALS FOR INTERNATIONAL.

That the Belgian horse is about due to enjoy a big increase in popularity in this country has been indicated in various ways the past year or two. One of the biggest influences in this direction is the activity of the Belgian Horse society, "Le Cheval de trait Belge." In addition to the publicity which this society is securing through the leading live stock journals, it is offering special prizes for Belgians at the world's greatest horse shows. A recent letter from Edgar Steyaert, one of the American Breeder's good friends in Belgium, states that the next International Live Stock Show at Chicago, has been selected as the place in America for awarding these special Belgian prizes.

MAKING SERVICES WITH A STALLION.

There is very little use for breeding hobbles. Mares which do not show to be in good heat should not be served with a stallion, but a capsule inserted into the womb instead. If a service is to be made on a mare that is liable to kick, the stallion should be handled with one hand and the mare with the other. Allow the two animals to be facing each other, after which the stallion can make the mount over the mare's shoulder. After his weight is on her and the attendant holding the mare's head up, she has very little opoprtunity to kick. When the service is completed and the stallion begins to dismount, turn her face toward the stallion as rapidly as possible. The stallion, however, should be thoroughly broken, so that he can be handled at any place or time with one hand. Many stallions can be educated in a very short time to come up within a reasonable distance of the mare and stop until he is given the word or sign to mount. Stallions handled with this method are not liable to be injured.

Some breeders use a chute successfully. This chute should be the length of a mare. The front end of it should be about three and one-half feet high and slope back to the ground. The width of it depends on the size of the mares. It should be from two and one-half to three and one-half feet in width. In front of this chute a pen can be made large enough to hold the colt. There will be little danger of injuring the colt, and the mare will stand much quieter with her nose on the foal. Two strong, substantial posts should be well set in the ground about six feet high, so the mare can be tied to these posts in front of her.

When a mare is bred in a chute or with hobbles on, the stallion must be well educated or the mare might be injured when the stallion mounts. A rushing stallion should be controlled by the bridle bit. His first education should consist in being taken out where other horses are. The attendant should have a rawhide whip and when the stallion won't mind him a good whipping is in order. This should be done around the front legs. A lesson each day should be employed until the stallion will mind, so that he may be led upon to other horses without making a fuss.

Stallions are easily educated and their memories are excellent. Some stallions do their teasing with one bridle on, and are not allowed to serve with that bridle on. They are taken back to the barn, and when another bridle is put on them they know that a service is in order. Breeders should pay more attention to the intelligence of stallions. A great many of our most sucessful breeders never use a bridle or halter during the service with both stallions and jacks.

The use of a whip or severe bridle should not be carried to extremes with stallions of a timid nature, as some of them are easily spoiled and made very slow. Whip only when a whipping is absolutely necessary, and at that particular time administer a sufficient quantity so that the animal will remember it. At all other times be gentle, but remember that a stallion is being handled.

There is an important announcement on the back page concerning your subscription to the American Breeder. Read it.

QUESTIONS
AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, makin git safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

STIFLED COLT—I have a registered standard bred colt that has been stifled for three months. The stifle comes out or goes back itself. It comes out when he steps over the door sills. He is lame when the stifle is out, but not lame when the stifle is in. What is the best to do for him? Will he ever be any account? Illinois Subscriber.

REPLY—After three months' time the ligaments that hold the patella in position have become considerably relaxed from the bone slipping out of place. We would suggest the application of the following: Powdered cantharides one-half ounce; biniodide of mercury two drams; oil of turpentine ten drops; vaseline four ounces. Mix all the above together and after clipping the hair from a place at least six inches in diameter over the region of the stifle, apply the ointment and rub it well for several minutes. This preparation will act as a blistering agent and the animal should be tied in a manner so it can not contact the part being blistered with its nose. Allow the blister to remain on for twelve hours, when it may be removed with hot water and castile soap. Apply a little vaseline daily to keep the parts soft. Repeat the blister in from three to four weeks.

DISCHARGE FROM NOSTRILS—A horse, nine years old, has been running from the nose for two or three years. In the summer he is all right, but in the winter he starts again. He is poor in flesh and has a rough coat. Is it a cold he has, or is it what is called gleet? I have asked a veterinarian and he told me it was just a cold, but he don't seem to get over it very fast. He is not so bad now as he was. I have used oil of tar on him, and it seems to have helped some. Indiana Subscriber.

REPLY—The fact that your horse is poor in flesh and has a rough coat would cause us to suggest that you have the animal carefully inspected and tested for glanders. If you are the proper caretaker of horses there is no good reason for his present appearance from an occasional irritation of the mucous membrane commonly known as a cold.

Glanders in a chronic form causes just the condition you complain of and unless it is plain that his emaciated condition is due to some other cause you should have it first decided as to whether or not glanders is present.

UNTHRIFTY MARES—I have several mares among my horses that are not getting along very well. We are feeding them the very best of feed, and are taking excellent care of them, yet they seem to be thin and their feed not properly digested. Some of these mares are young mares. Feed is very high and we would like to ask if there is anything that will put them in better condition, and make them get more value from their feed. North Dakota Subscriber.

REPLY — Without first having knowledge of just what you are feeding, how the rations are fed, and what kinds of feed is available in your locality, places us at a disadvantage in attempting to advise you just what to do to secure better results. The past season was an unfortunate one for many stockmen inasmuch as in many sections the crop of the most desirable food stuff was cut short. If you are dealing out good, sound grain and roughness to your stock in liberal quantities in a manner so that you know each individual gets its allotted share and you find that some of the stock continues unthrifty in spite of good care, then we should search for local conditions in individual cases.

A careful examination of the teeth should be made by a dentist competent to determine wrong conditions and competent to properly remedy these conditions when found.

Again it may be that some of these animals are infested with intestinal parasites which are frequently a cause of unthrift in stock this season of the year.

If animals have been kept on one particular kind of diet they frequently can be started into a better condition by a change in feed. An easily accessible place to good water is always in order while attention to a supply of salt should not be overlooked.

CONSTIPATION—I have a horse coming nine years old in April that gets sick about every three weeks in the winter time. I think maybe he has worms. He always stands stretched out and has his head up straight. He paws with his front feet, and raises his feet so high that he often gets them in the manger, which is three feet high. He does not roll, he just lies down and stretches himself. He is slow in making service and it seems to hurt him. He is usually sick for about one day and night at a time. Washington Subscriber.

REPLY—The symptoms that you give indicate that your horse suffers from inactivity of the bowels. So far as external appearances go you may not notice this, but during the winter season when stallions are not permitted to take the amount of exercise they should and are being fed for months on dry forage, the bowel becomes inactive and fills up beyond its normal proportions so that there are periods of slow going pain.

We believe your animal will be benefited by more exercise if it is possible to give it to him, and a more laxative diet. For coarse forage make about one-half his ration clean, bright alfalfa hay. Good wheat bran with a handful of old process ground oil cake is also excellent for stallions out of the breeding season. Encourage a lax state of the bowels and report again if these annoying symptoms do not disappear.

NAVEL ILL—I am writing for some desired information, as in the past I have had trouble and loss with young colts. One colt that died lived up to the age of about two weeks. It swelled up in the left hind leg and remained so for twenty-four or thirty-six hours, then the front leg also swelled, and then the whole body swelled and it died. Now, I thought I was doing my best with this colt, as when it would storm or rain I would put them in the barn, which I tried to keep clean, but as it was a very poor place I fear it took navel infection, and if so, can I do something to prevent this? I have a good barn now, and would you advise putting the mare in the barn at foaling time or leaving her loose? Have you found it profitable to use anything on the navel, such as iodine or some other solution? Wyoming Subscriber.

REPLY—Your description indicates that you have your case properly diagnosed and that the difficulty is navel ill.

Whenever mares are permitted to foal in barns it is always the better plan to first give the floors and walls a careful cleaning. A yearly application of a thin coat of whitewash is a good thing for the interior of buildings in which stock is kept and is in order for the box stall in which the mare is to foal.

The floor should be thoroughly wet with a strong solution of carbolic acid, using at the rate of a tablespoonful to a quart of water. See that the bedding is bright and kept clean.

When the colt appears, thoroughly swab the navel with tincture of iodine and arrange a bandage around the body so as to protect the parts from infection. If a pack of clean cloth can be placed over the navel, having first thoroughly wet it with a one to a thousand corrosive sublimate solution it will be of great help in keeping the parts disinfected. This pack may be supported in place by means of the bandage mentioned.

If weather conditions permit of mares foaling in the open it should be done in pastures and not in lots or paddocks where danger of infection lurks.

LAME MARE—I have a seven year old gray mare that has a crack in the center of the frog of the hoof, about an inch deep, and matter has been coming from it. She has been lame from it for a year and a half. What can I do to cure it? Nebraska Subscriber.

REPLY—The first thing to do is to search for the cause of the trouble. Perhaps the best thing to do would be to engage a qualified veterinarian to investigate the parts. It may be that some foreign object is imbedded in the tissue, causing the trouble, or it may be that there has been an injury resulting in the formation of a fistulous tract. You should lose no further time in having this attended to.

SIDE BONES—I have a five-year-old imported Percheron stallion. Last fall he got lame in one front foot. I examined it, had a veterinary to examine it, but nothing could be found. Took his shoe off and in a week or so he wasn't lame. Put his shoe on and made a few trips and put him in for the reason he appeared all right. This was September 24th. The latter part of December he became very lame in both front feet. Had a veterinary look at him. He pronounced the lameness side bones. Is there any cure for them? Could you tell me what to use so he would not be lame? Only very good horsemen can detect it on him. The average farmer could not, only he limps. I would like to get him in shape before April 10th, or before the season opens. I am aware of the new Iowa law, January 1st, 1912. Iowa Subscriber.

REPLY—It is important in treating side bones to keep the hoof sufficiently soft and yielding so as to prevent pinching the sensitive parts. This is perhaps best done by subjecting the feet to soaking in warm water or applying poultices. After such applications the hoofs should be daily annointed with vaseline or neats foot oil to prevent evaporation. An occasional blister over the seat of sidebones will often be of help. In shoeing it is well to apply a bar shoe and have the shoer cut away the quarters sufficiently to relieve all pressure on the forming side bones. This method of treatment will ordinarily overcome the lameness in due time.

ENLARGEMENT IN GROIN—Jack, twelve years old, has enlargement in right groin. I call it the kernels enlarged. They will be feverish, burst, and run matter. Has done this two or three times. Has had this trouble for several years. Bothers him in serving, I suppose, as he will sometimes enter, quit and get down. He has been a very fair foal getter through this trouble. Do you think this is due to diseased tissue in the groin, and should it be removed? Have in time past gave him Pat. Sodide, and after giving it for a few days the jack would discharge at the right nostril a mucous, as if he had distemper. The trouble would get better, and after a time would re-occur. Texas Subscriber.

REPLY—It is very likely that a group of superficial lymphatic glands located in the region is involved, and you ought to consult a good veterinarian with a view of having them removed. The fact that it has annoyed your animal for some time is pretty good evidence that it is not going to recover without some surgical interference. It might prove helpful now that the breeding season is close at hand to give him an occasional injection of bacterin, which is an agent that has proved very useful in suppurative conditions.

INJURED HOCK—I have a mule, ten months old, that was kicked in the hock by a horse shod with neverslips, which made a hole. I had a veterinarian examine it and ne claims the joint water was let out. I am doctoring according to his directions. He claims the colt may heal up so it would be impossible to tell it was ever hurt. I would like to have your opinion. Nebraska Subscriber.

REPLY—Your letter does not indicate how severe the injury was, as evidenced by swelling, amount and character of discharge, painfulness of parts, etc.

Open joints are usually very serious but the seriousness is many times governed by the extent of opening as well as laceration and contusion of parts at time of injury. The particular joint involved is also to be considered, inasmuch as opening a prominent articulation is more serious than the invasion of a minor one. Open joints are often a cause of death, while in other cases they may, as in your animal, show promise of healing out without impairment of future usefulness or cause permanent blemish.

DIFFICULT DELIVERY—Last spring when one of my valuable mares was delivering a colt, we assisted at the delivery. The colt was expelled except the hips, and we could not get it any farther than that for about a half an hour, and the colt died in that position. We had difficulty in getting the colt started right, but after the start it came all right until it got to the hips. When is the best time to assist the mare in delivery? Should the fetus be pulled all the time or should I wait until the mare strains before pulling? Oregon Subscriber.

REPLY—After the fetus has started through the pelvis it is best to encourage a rather prompt delivery, for the reason that if the envelopes become detached from the uterine wall and the fetus has not gained exit there is great danger of it perishing.

Frequently when the hips lodge as stated, they may be rotated one way or the other so as to favor their coming through the pelvic cavity.

As a rule, one should aid the mare at the immediate time she strains, but there is no fixed rule for delivering the young.

RIDGLING—I have a horse, four years old. Last spring I had one of his testicles taken out with the expectation of his other one coming down. It has not come down yet. Is there any remedy to make him swing the other testicle? Indiana Subscriber.

REPLY—We know of no means that will induce the testicle that is perhaps within the abdominal cavity to descend into the scrotal sack. The best way to remedy the condition is to have him castrated by a competent surgeon, which operation entails no great risk of the animal's life when done by a good man.

CHRONIC LAMINITIS—I have one of my dray horses that was foundered from a spell of indigestion some time ago, making him very stiff and sore. In a few days after, we put him in harness, but had to take him out on account of one foot breaking and running just at the top of his hoof, making him very lame. We commenced treating it and finally healed it up, but it seems as though the soles of his fore feet are bulging down, and they are very hard and dry, but so he can't travel on them. He is in fine condition and hearty. Have been using a foot remedy for him, but the weather has been so cold have not used it very much for fear of freezing his feet. Will ask if you cannot give us some cause, and some treatment for it. Missouri Subscriber.

REPLY—Your animal has by this time been affected sufficiently long that it will be very difficult to relieve it a great deal or even hope for a permanent cure.

The attack of laminitis has been sufficiently severe to cause a separation of the bone of the foot from the wall, which is evidenced by the dropping of the sole.

We would suggest that you envelop the affected foot in warm poultices for a week. Change these poultices for new ones once a day. This practice will soften the dry, hard, horny sturctures so as to give some relief. After poulticing clip the hair from the roof line upwards about two inches and apply the following, rubbing in for three or four minutes: Powdered cantharides, one ounce; lard, four ounces. Mix together and apply in the manner directed. Tie the horse's head up sufficiently so that the animal can not get its nose to the parts, for the above preparation will blister. In twenty-four hours wash the parts off with warm water and soap and make a daily application of lard to keep the parts soft. In the course of ten days or two weeks begin the poulticing again, and in a week more repeat the blisters. It is very likely that your horse will be incapacitated for working on hard streets or ground but may be helped to the point of doing satisfactory work on soft ground, as in certain farming operations. Such an animal, when put to work, should be shod with a plain, heavy, flat shoe without

(Continued on page 19.)

THE AMERICAN BREEDER

With which is combined
THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE Editors.

Published semi-monthly (on the 5th and 20th of each month) by the
GRAHAM PUBLISHING COMPANY, INCORPORATED.
225 WEST TWELFTH STREET.
Kansas City, Mo.
BELL TELEPHONE, 4297 GRAND.

All communications for this paper should be addressed to the American Breeder, or the Graham Publishing Company, and not to individuals.

Advertising space for a single issue, $2.80 for an inch or less. For larger space or longer time, rates furnished on application.

Subscription Rates.

To all points in the United States and Mexico, per annum, 50c; 3 years, $1, payable in advance.

To all points in Canada, per annum, in advance, 75c.

To all foreign points (in the International Postal Union), per annum, in advance (6 francs, 5 shillings), or $1.15.

When sending subscriptions, please state whether they are renewals or new ones. Always renew under the same name and initials as previously used, and at least two weeks before your present subscription expires, so that you will not miss any number. When changing your postoffice address, state the old address as well as the new one.

Watch the wrappers on your paper. The month before your subscription expires they are stamped "your subscription expires with next issue," and on the following edition is stamped "your subscription expires with this issue." When the time for which the AMERICAN BREEDER is ordered has expired, it is always discontinued.

If you miss your paper please notify us at once and all lost copies will be replaced.

Entered as second class matter, November 23, 1911, at the postoffice at Kansas City, Mo., under the act of March 3, 1879.

All persons are warned not to reprint any part of this paper during 1912, without giving full credit for the same to the American Breeder, Kansas City, Mo.

STARTING CAPSULE BREEDING.

It is not best to try to force the complete adoption of a new method in a community the first season. The breeder who is introducing the capsule system can make two natural services on one day and the next day can advertise to make one service at 4 o'clock in the afternoon or any other hour that would suit his community best. The afternoon service, however, is more effective, as the mares are usually taken home and not worked hard. If they were bred in the forenoon many of them would be put to work. The hour advertised for the capsule service should be kept regardless of demands. Three services in two days is all any stallion ought to make. By having a special hour it will be easy to get a good bunch of mares together on many occasions. This will not antagonize the customers, for those who prefer will have an opportunity to breed with the natural service every other day, and if only one mare is presented on the other three days of the week they can have the natural service at that time.

This is a very good plan to follow, as frequently a breeder wishes to get away from home occasionally. This will not inconvenience anyone, and the breeder can have each forenoon to transact any such other business as he cares to.

We do not advise advertising for barren mares the first year. Breed only good, healthy mares in order to establish the new method of breeding. If barren mares are bred extensively with the capsule system there are those who are willing to say that the capsule system is at fault if all of them are not settled. After the breeder has a good number of capsule colts in the community there will be no further difficulty. The owner of every good stallion or jack should study this system carefully, as it means a great saving on stock and an increase financially. It is not best to start the capsule system of breeding until the weather begins to get warm, as it is difficult to keep the semen at the right temperature on cold days.

HEALTH OF STALLIONS.

The usual life insurance rate on stallions is ten per cent. This rate is supposed to be based upon statistics. If the estimate is correct, the extreme price can be attributed to the methods of handling stallions.

On a stallion insured for $1,500.00 the cost for one year would be $150.00. This will build a barn and fence two acres stallion tight, which is the best insurance anyone ever procured. The barn should be built a considerable distance from other buildings and other live stock. This will eliminate the danger from fire and infection greatly.

A hitch rack a considerable distance from this enclosure should be erected, where all strange horses should be compelled to be tied until they have been examined as to infectious diseases, before allowing them to come near the barn. At a breeding barn one or more mares from nearly every farm in the entire community will be represented, and if there is any infectious disease in the community it is liable to be brought to the breeding barn. This hitch rack should be erected so that the sun could strike the location clearly, for the sun is the greatest germ destroyer known.

The barn should be erected with a door in the south, which should never be closed. Bars should be used to pen the stallion in, in case it was necessary. The stallion pasture should be on the south of the barn, the lay of the land should be gently rolling, if possible, so it will drain nicely. A substantial water tank should be placed in the corral where the stallion can drink at his will. This should always be kept full of water. The feed should be regular and no sudden changes made at any time. The stallion should never be permitted to make a service on a full stomach. Keep the barn clean. All manure should be thrown out each day. If manure should accumulate in the corners of the corral, throw it out. It is this filth that causes stallions to have the thrush. Stallions kept under these conditions will always be sleek and nice. Their digestive tract will be in good condition and they will not be liable to take ordinary diseases.

A feed box can be adjusted so that any member of the family can feed the stallion without going into the barn. A manger can be adjusted in the same way. But the one feeding the stallion should know just how much and what to feed. A stallion handled in this manner should die with old age as a rule, and until old age be in good condition from a breeding standpoint. This will not only do away with so much danger of death of the animal, but it will actually increase the stallion's earning capacity.

UNSCRUPULOUS IMPREGNATOR DEALERS.

Just as long as breeders patronize dealers who keep goods for sale and not for use, will these unscrupulous dealers keep flooding the country with literature every year. Some of these dealers guarantee everything, but what is the guarantee worth after the breeder has parted with his money and the dealer refuses to make the guarantee good?

One impregnator dealer announced in his literature recently that it was dangerous to take the semen from the uterus, in order to discourage breeders from taking up the only successful method of artificial impregnation ever introduced, but the same dealer, now mind you, is advocating this same plan and agrees to furnish full directions with the order. The breeders must not be misled by this attempt to ruin the only successful method of artificial impregnation. In the tons of circulars that this individual has sent out did anyone ever see in his literature or instructions of any kind, that it was necessary to sterilize breeding instruments before using them? His other instructions are just as unreliable and the principal thing for which he sends out these circulars is to sell a lot of worthless stuff. Is it any wonder that many breeders are skeptical about artificial impregnation? They have been "skinned" by the thousands, and the horse breeding business has suffered greatly as a result.

The "easy to use" directions and the guarantee that every mare will get in foal is a great inducement to breeders to bite at the sucker's bait. When any impregnator concern offers breeding instruments for sale that do not require boiling, do not buy them. It is the only practical way to clean instruments. If antiseptics are used strong enough to destroy bacteria, it will in many cases be strong enough to destroy the spermatozoa.

EXPENSIVE FEEDS MAY BE ECONOMICAL.

Two extremes are sometimes reached in seeking economy in horse feeding, and Kansas has recently furnished good illustrations of both extremes. In one a proper combination of wholesome, high priced feed stuffs was shown to be the most economical ration for maintaining horses at work. In the other, the sparing use of a cheap class of rough forage has proven to be by all odds the most costly.

During several months of the past year the Kansas Agricultural College, in connection with the big military post at Fort Riley, experimented on 437 head of horses, using various feeds and combinations of feeds, including everything that would be considered practical for this territory. The particulars of this experiment have already been given, and we allude to it here only to illustrate our point; that the most economical feed on which horses could render the services required at a military post, and at the same time maintain fair flesh and good condition, was a combination of two of the highest priced food stuffs on the market, namely, good, bright alfalfa hay and clean, sound corn. Oats, of course, maintained its reputation for one of the best single rations, but it did not show any advantage either in economy or in flesh and apparent condition of the horses, over the combination just mentioned.

Since the close of the experiment hundreds of cases have been reported to state veterinarians, and various agricultural organizations and publications, in which attempts to economize in horse feeding by the use of mouldy and otherwise damaged grain and forage have resulted disastrously. The latest reminders of these experiments have come in stories from the range, telling of the death of a number of horses which seemed to be fairly supplied (as winter feed on the range goes) with such rough forage as was raised last summer in these districts. Although poisoning from mouldy feeds had been frequently reported earlier in the season, investigation showed that these horses had not died from poison, but rather from a combination of starvation and reduced vitality, resulting from their efforts to get a living and withstand the cold on the coarse, rough fare provided. It was found on examining the forage with which the horses were being fed that it contained very little nutriment but was principally wooden tissue, not only indigestible but irritating, and entirely unfitted for the use to which it was being put. Cattle, on account of having a larger digestive tract, especially adapted to consuming coarse feeds, are able to maintain themselves upon the care which was resulting practically in the starvation of the horses.

We are not calling attention to these two extremes in economical and expensive horse feeding in a spirit of criticism, for in many cases the conditions on the range the past winter have left the ranchmen no alternative. Their unfortunate experience, however, emphasizes the point, that what appears to be the cheapest feed may easily prove to be the most expensive.

TRAVELING INSTRUCTORS IN SCIENTIFIC HORSE BREEDING.

The American Breeder is arranging for traveling demonstrators, who are successful breeders, to travel over the country and give public demonstrations of scientific horse breeding. The instructors will stop at each town two days and deliver a series of lectures to the mare owners.

During the spring season we will have only one man traveling, but beginning September 1 it is our intention to have at least eight men traveling all over the United States. These lectures will be free to anyone. This is probably the first service of this kind rendered by any paper—the sending of an experienced man out into the field among its readers to assist them. We cannot expect to extend this service to many localities this spring, but during the next year great good should result from the work of these practical instructors. No one will be sent out in this service unless he has been a successful breeder himself. There will be positions open for a number of good men.

V. O. Cudd will fill the following dates:

BUYING A STALLION.

A breeder recently came into our office and stated that he had just bought a fine stallion. He also said that the party from whom he purchased the stallion was the fairest man he ever saw. That he had guaranteed everything he asked for. After he had talked a considerable length of time we told this individual that the party from whom he had purchased the stallion was barred from advertising in the American Breeder, owing to his crooked methods of doing business.

There are many things which the first time stallion buyer is not familiar with, and he is an "easy mark" as a rule. For one thing he has not realized that if an individual having considerable influence politically, in his home county, was sued by a nonresident it would be difficult to obtain judgment. County officials are elected by the people, and there are not many of them who wish to cultivate the ill will of influential men in their home county. There are many other ways in which a dishonest deal-

er can protect himself from the attempts to secure justice, made by a swindled customer. We mention this subject and suggest this one caution only, because there are men buying stallions at this time who need to keep it in mind.

Every buyer of horses, cattle, or anything else should do his own thinking. So far as is possible we protect our readers by refusing the business of the few we have known to commit frauds. Our policy in this regard is pretty well understood, as a rule, both among those who advertise with us, and among those who would like to, and it is a pretty good plan for the buyer to let it be known that he is a reader of the American Breeder when purchasing stock.

SELECTING PROLIFIC BREEDING STOCK.

One is frequently asked why one animal is more prolific than another. If a colt is castrated it loses the appearance of a stallion. The earlier its castration the more of the masculine character it loses. If castration is not done until the animal has reached a considerable maturity it would then show much of its masculine character.

Masculine character consists of a well developed crest, a heavy jaw and a general bold apearance. The eyes may have an appearance of being blind, owing to their fixed vision on some distant object. These stallions under some conditions, might be easily educated to fight either man or beast. A great many of our best stallions having well developed masculinity have good dispositions, owing to their subjection for many generations by man.

Stallions frequently endure many hardships detrimental to reproduction, and yet prove reasonably sure. Every one interested in horse breeding should pay particular attention to masculinity in selecting a sire. Stallions having much masculinity will stand more services than those displaying more feminine characters. These characters are not always easily distinguished, as a stallion showing a high nervous organization may be mistaken for that bold appearance which indicates masculinity. Occasionally a famous draft sire will possess these good qualities, yet look very sluggish in general appearance.

Where horses have become similar in size and conformation and the colts are left entire, affording a large number of stallions to be mated with the wild mares in that section, a survival of the fittest will eventually be the stronger. A wild stallion will patrol his band of mares and protect them against all comers, not allowing other stallions to mingle with his flock. Most of their fighting is done by biting, which requires a strong, heavy jaw. Those unfortunate sires of feminine characters are easily subdued in such contests.

In service, stallions possessing much feminity may be reasonably sure to a limited number of mares, but after the season has progressed the mares may be returned more frequently, denoting the failure of fertilization.

A good brood mare should have a feminine character, a very gentle expression from the eyes, thin, clean cut jaws, very little or no crest and a good disposition. A mare of this kind should fertilize at the first service from the stallion having much masculinity, if other conditions are natural. A mare of much masculine character is usually a shy breeder; that is, all conditions must be the best, in order to effect conception. A mare having much masculinity will frequently breed better to a stallion possessing considerable feminine character. This is one of the reasons why a change of semen will frequently get results when everything else fails. This should not be misconstrued to mean that a mare failing to conceive to a certain stallion would breed better with a jack in all cases. A jack is usually a better server than a stallion. The slow, easy movement, usually results in the mare responding, and receiving the discharge in the uterus where it must be before fertilization can take place. There are mares which will not breed to a jack, owing to the fact that they will not hybridize.

If a mare is spayed at a very early age she will usually show more masculinity than if nature had not been interfered with. This is a peculiar condition, the converse of that found in stallions which are castrated, and it may be that the failure of the generative organs to be properly developed, will be accompanied by a similar excess in masculine or effeminate characteristics.

Stallions or mares having a small heart girth or a light flank are objectionable from a breeders' standpoint. All beasts of burden should have plenty of room for heart and lung action. Animals having a very light flank will easily "physic." Any slight derangement is liable to cause the digestive tract to become abnormally extended which is closely associated with the generative organs. This is more especially true with mares. A mare is occasionally found with extreme masculinity and a light flank. They are very difficult to fertilize.

HORSE DEMAND A BROAD ONE.

There is probably no question concerning the future of live stock prices that affords as much argument and speculation as that of horse prices. On every hand men can be found who assert that the growing use of the automobile and motor is bound to knock the bottom out of the horse business.

A glimpse at the course of business in 1911 will furnish an interesting light on the question. It is probable that the percentage increase in the use of motor vehicles designed for heavy hauling was greater than will be shown by this or any succeeding year. Certainly it was greater than was ever known before, and motor car men, as well as the public in general, believe that the record was made. This remarkable increase was, of course, not so much due to a natural demand as to the activity of a selling organization employed by the manufacturers. And the extremely high prices which had been reached by draft horses of all weights, furnished the opportunity.

In the face of this increase, the business in commercial classes of horses maintained itself, and the year of 1912 will witness even greater difficulty than was experienced in 1911, in filling of orders for the best class of draft animals. General business and agricultural conditions throughout the country have been not at all favorable to a boosting of prices. They have been rather the contrary. Last year, in addition to being a year of short crops, was a year of industrial retrenchment. New enterprises everywhere were held in abeyance, and on the live stock markets of the country horse prices alone averaged higher than for the previous year. There is hardly a chance that 1912 will not do as well or better for horse stock showing any degree of desirability. In fact a favorable agricultural season and normal conditions would give us the broadest demand for good farm and commercial horses we have ever known.

The Southern demand for good heavy mares is just opening up, something practically unknown a year ago, while the enormous increase in cultivation of farm land in Canada promises to take more horses out of the United States than ever have been exported in the history of the country. In all the agricultural expansion on the North American continent there has been nothing quite so great as the recent rush to Canadian farm lands. Heretofore the newly settled sections within the United States have remained more or less in the range class for years, only part of the land being immediately put to plow. In the great wheat area of Canada, however, the desire of every settler is to break every foot of sod as quickly as he possibly can, and this is making the biggest outside demand for farm horses that we have ever known. No man need be afraid that good horse stock which will fit into the better market classes or produce good, drafty mares, such as the progressive farmer of today requires, will become a drug on the market.

SETTLING MARES.

It is not the number of mares bred, but the number of mares which are settled that decides the profit on a horse. Many stallions are used too heavily to produce a large per cent of foals. A stallion can make a service that seems to be regular in every way, and yet not discharge any live spermatozoa. This can only be determined by the use of the microscope. Two services one day, and one the next, is the limit for the average stallion, when this number of services are employed for several weeks. When more mares are bred it means that many of them will be returned for future services, which in the end means that many services are wasted. A stallion must be in good condition, as a rule, to discharge live spermatozoa for any length of time at three services for each two days.

Those stallions which do not discharge directly into the uterus never get as large a per cent of foals as those which do discharge into the uterus. About sixty per cent of the services are made into the uterus. Those stallions or jacks having a long penis are not as sure as those having a shorter penis. The cervix is crowded out of line and the discharge is made in the vagina. This illustrates one of the advantages of the capsule system—every capsule service, if properly done, is a complete service. The semen must be deposited in the uterus before fertilization can take place. This is the reason that a service on a large mare is more liable to fertilize than on a smaller mare having a shorter vagina. The uterus is hung on ligaments in such a way that the cervix will meet the penis, although it be very short, and receive the semen. Mares have considerable power over the muscles of the cervix which is expanded during the act of copulation in normal mares.

Nine day mares can be best bred with a capsule without being tried. Nine day mares are usually excited at the time of service owing to the fear of injury to the colt, which causes many of them to miss at that service. The plan of throwing cold water on a mare, or any other plan that will excite the female should be dispensed with. Neither is there any advantage in breeding mares at any particular time during the day. Fertilization may not take place for several days after the service.

There are a lot of mares that have a closed cervix, which has become slightly lacerated and that can never be fertilized by the natural service. These mares can usually be settled by employing the capsule system. Many of the mares having a large open cervix which have been injured at a previous foaling, can be fertilized two days after the heat period has closed, by breeding them with a capsule. Some of those mares having a diseased condition can never be fertilized without treatment. A treatment which has proven to be a profitable remedy during the last year will be printed in the April 5th barren mare edition. This is a very simple remedy. Stallion owners should use it as it is very effective. It has been simplified so that a mare can be treated in just a few minutes, and the entire expense of all preparations and all medicines (which can be purchased at any drug store), will not cost over one dollar. This is the best investment any breeder ever made. The barren mare edition will have four big charts suitable for framing, showing the genital organs of the mare. These drawings cannot be obtained anywhere else. We want all of our readers to be sure and study the barren mare edition, which will be printed April 5th. It should be worth hundreds of dollars to every breeder.

TEASING MARES.

Mares are usually teased more than is necessary. A very good sign is to stand behind the mare and watch her urinate. If the water falls straight down she is probably in heat, but if it should fly back a considerable distance the chances are that she is not in heat. The clitoris in the mare resembles the penis in the stallion to the extent that during or just before copulation the clitoris increases in size in such a manner that the lower part of the vulva is widened. This allows the urine to fall down. If the clitoris is not expanded the vulva will then assume its natural position and the water will fly backwards. This is not an infallible sign, as it is hard to distinguish this condition in some mares owing to the size of the clitoris. Some mares have a very small clitoris.

A very good method for teasing mares is to have a hitch rack where mares can be tied a considerable distance from other stock, so that the stallion may be led out in front of the mares, so that they are not afraid, they will usually show signs of natural heat much quicker than if someone holds them with a severe bridle. By having the stalion led by them a few times, someone can quietly slip behind the mares and see the condition.

A great many mares are bred while pregnant. Practical horse men have often stated that ten per cent of the pregnant mares could be made to receive the embrace of the stallion at some time during pregnancy. Breeding while mares are pregnant is a loss to the stallion owner and dangerous for the mare owners. If there is any question it is usually a better plan for the ordinary breeder who has not made a study of this special subject to wait until the mare shows positive proof of being in season.

The disposition of mares must be taken into consideration, as some mares never show very positive signs of being in heat. But most mares of this kind will show heat if in a normal condition, at every period, although the period may be very short. Breeders frequently complain, that certain mares never come in heat. If these mares are tried every day for three weeks a heat period will probably be found although occasionally it may not last more than a few hours or a day or two.

BARREN MARE EDITION.

The annual barren mare edition will be printed April 5th. We want our readers to ask all the questions they care to concerning barren mares, to be answered in the barren mare edition. This edition will have several large illustrations (female organs) suitable for framing, and we want our readers to hang these illustrations up in their offices.

A breeder must first know something about the organs of the mare in order to be of the most service to himself and his patrons. The barren mare edition will be worth several years' subscription to anyone interested in horse breeding. We especially ask our readers to watch for it, and if they do not receive it promptly, write for it. We want all our readers to have this issue and study it closely and frame the illustrations. We make mention of this because many may be busy as the season will be open by that time.

CAPSULE SYSTEM BREEDING

I would like further information about breeding mares with capsules, and where the capsules can be obtained. A. J. Everett, Greeley County, Kansas.

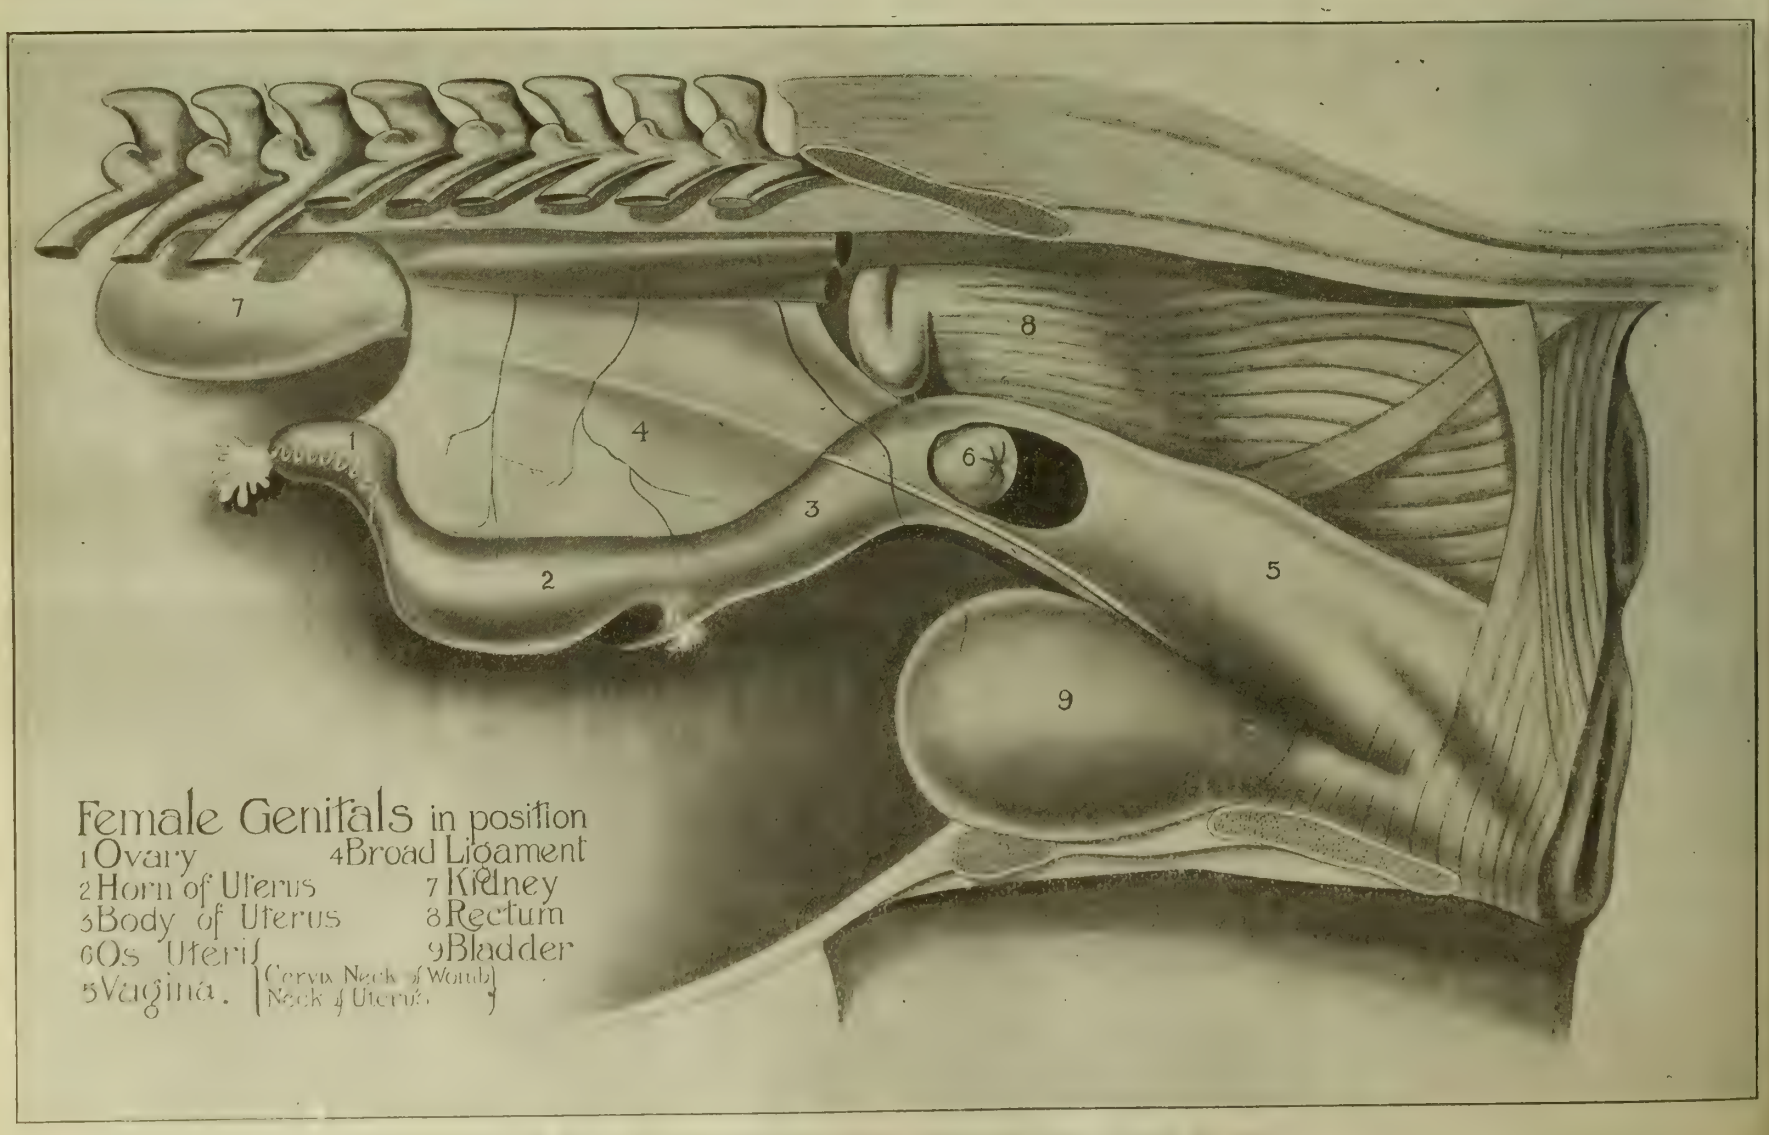
In order to be successful with the capsule system the breeder must know the position of the generative organs. The chart below should be studied carefully. Other charts will appear in an April issue.

The stallion or a jack used must be known to produce semen containing live spermatozoa in order to be successful with the capsule system. The mare, upon which the service is to be made, must not be diseased. She must be gentle so that the operator can work without difficulty. All the mares that are to be bred at that service should be present, and each one should be examined beforehand in order to determine whether the capsule can be inserted easily or not.

The capsules are one-half ounce capsules, with one end pointed as otherwise they are hard to insert in many mares. The capsules must be kept in a closed box, and must not be handled at any time, except when the hands have been thoroughly washed with soap and water. The capsules must be kept absolutely clean at all times. When the mares are ready to breed, take the caps off of as many capsules as you are expecting to use. Have them in a handy, clean place. Have the Carlson semen extractor boiled each time before using. It is not necessary to boil it any length of time. The leather washers might thus be spoiled. If it is sucked full of boiling water a few times that is all that is necessary. For keeping the semen a pan three feet long, six inches wide and six inches deep can be made by a tinner. This is for keeping the water at right temperature. This water should be boiled before it is used. A convenient stove may be used for boiling the water, but a good method for keeping the water at the right temperature is to take a cracker box and place two coal oil lamps in it, one at each end. Cut holes in the sides of the box, so that the flames from the lamps will come in contact with the galvanized pan. Place one or two hot water thermometers in the water. Regulate the lamps to retain the temperature, which should never be lower than 95 nor higher than 101 degrees Fahrenheit.

It is not necessary to have a breeding room, but this work should not be done in a current of cold air. It is more convenient to have a room to operate in. A stall in a barn or even a tent is sufficient, but the place where this work is done should be kept clean. The direct rays of the sun must not strike the semen. The semen must be kept in the shade. The sun is a great germ destroyer.

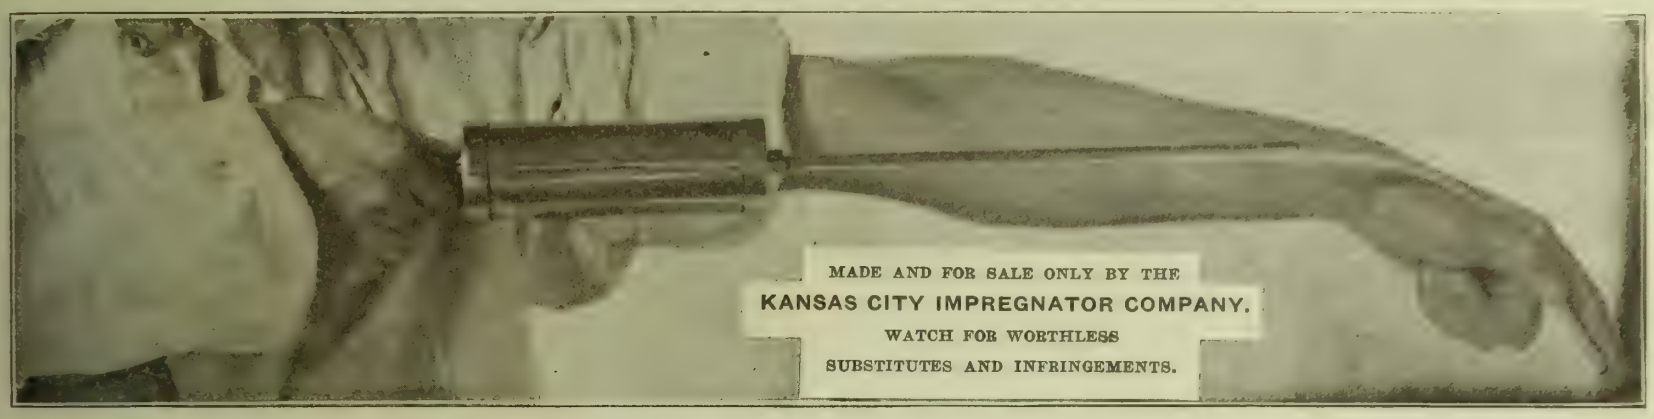
After the mares have been examined, and one has been selected for the service, the stallion or jack is brought out. If the operator is to make the service he should first wash his hands thoroughly, then use a pair of white gloves made of cloth that can be boiled before using at each service. A helper should have a pan which has been sterilized by boiling, full of sterilized water, at body temperature, in one hand and the extractor, which has been sterilized by boiling, full of warm water. After the stallion makes the entrance, the operator then removes his sterilized gloves and takes from the helper the pan and the extractor. The operator has his sleeves rolled up, or better still has the sleeves cut from a clean painter's jacket, especially for this work. Before the stallion dismounts the water is thrown out of the pan, which has kept the pan warm. If the stallion withdraws any semen it is caught in the pan and covered immediately to keep the sun from striking the semen, and is taken into the breeding room, or into a shaded place where the water is discharged from the extractor and the semen from the pan is sucked into the extractor. If no semen is withdrawn at the service the water is discharged from the extractor and the operator proceeds to obtain the semen, either from the vagina or the uterus of the mare.



A mare having a nine day colt will usually have the discharge in the uterus. The point of the extractor is placed under one finger, which is inserted into the uterus and the point of the extractor bent down to the lowest place in the uterus. There a depression is made, allowing the fluid to collect in the lowest place, and from this the suction is made. The suction should be made slowly, and if the extractor seems to pull hard it is likely that the fine membranes have clogged the suction. The plunger should not be pulled until these membranes have been removed, and it is better to push it back in if the membranes are clogged considerably.

If the semen is not found easily the cervix can be pushed forward gently two or three inches and the front part of the uterus can be pulled back with the finger in the uterus, making a depression so that if the finger is pulled back the fluid follows in the depression back to where it can be reached easily with the extractor. Semen does not run as easily as water, and requires more time for it to accumulate in a depression. It sometimes requires several minutes to get the semen, and especially on mares having young colts, as the membranes are very pliable at this time and are liable to clog the suction. The semen is not easily obtained from the uterus of a mare having a colt, but if the operator is in doubt concerning the diseased condition of a mare he may use a nine-day mare, but the suction should be made very gently.

It may take several times before the operator can successfully do this, and we would advise experimenting a few times before the actual breeding is started. Anyone should be able to get the semen from the uterus or vagina without much difficulty if they will practice a little. The extractor may be filled with boiled water at body temperature and discharged into the uterus of an old mare and then take the water up in the extractor again, until the operator is proficient. Occasionally when one tries to breed a large number of mares the first time, there is more or less excitement and the operator is working under difficulties, but if he is confident of getting the semen the remainder of the work is not difficult.



After the semen has been obtained in the extractor it is taken to a shaded place where the sterilized water in the galvanized pan is kept at a temperature of about 100 degrees. The helper has put away the stallion and has washed his hands thoroughly with soap and water, and takes the extractor. He holds the extractor in warm water where the operator has kept it since withdrawing it from the mare. The helper holds his finger over the point of the extractor to keep the water out, then the operator takes one capsule and the helper holds the extractor up and fills the capsule one-third or one-half full. Never allow the capsule to get full or run over as it is difficult to put the cap on if the outside of the capsule is wet. The operator puts the cap on and holds the capsule in his hand to keep it warm and away from the sun. The mare owner is holding the mare, and another mare owner is requested to hold up one of her front feet so she can't kick. The capsule is inserted into the uterus and if the uterus should be unduly large the capsule should be turned so that she can not discharge it. After this mare is bred

(Continued on page 18.)

A SIDE VIEW OF THE GENERATIVE ORGANS OF THE MARE.

Breeding Appliances of All Kinds

Bending the Soft Metallic Point of the Carlson Semen Extractor After Being Inserted in the Uterus (Womb). The Neck of the Womb Will Bend to Meet These Conditions Without Injury.

The Carlson Semen Extractor and Capsule Syringe

Which can be used as an impregnator or for getting the fluid out of the vagina or uterus for filling capsules. This is the only way to use capsules successfully as 60 per cent of the services inject the semen into the uterus where it cannot be obtained otherwise. The syringe holds 8 ounces of fluid. This instrument is being used successfully by thousands of breeders. It is made of the best metal and can be taken apart easily and boiled, which is the only way breeding instruments can be properly sterilized. As shown in the illustration above, it has a soft metallic point at the end, which can be bent in any direction after it is inserted into the uterus. This is the only instrument that can be used for getting the semen out of the uterus. All necessary directions telling how other breeders are using the Extractor sent with each order

Price $5.00 For a Limited Time.

Curved Metal Impregnator

This instrument is sold by other dealers for from $5 to $6. It is nickle plated, about 22 inches long, with a glass tube in it. Price $4.00.

Microscopes

For use in testing the semen of stallions or jacks. Made especially for this purpose. Magnifies 500 times and is used by veterinarians and physicians. Price $35. Boxed in fine case. These instruments are of great value in the breeding business. Through them you can see for yourself and show your mare owner the live spermatozoa of your sire.

Thermometer

Tested and used for keeping water at the right temperature.

Price 75 Cents.

POINTED Breeding Capsules

We have the only capsules made especially for horse breeding. Some capsules do not dissolve, leaving a foreign substance in the uterus which will prevent conception. Other capsules are too flimsy to use for this purpose. You cannot make any mistake by buying capsules from us as we only have one kind. We have them boxed with 100 in each box. The box is tight so they will be clean. These capsules are properly baked and all bacteria killed before they are mailed. Always keep the lid on the box when not in use. Price per box (100) $1.50

Directions for Ordering

Send money orders or draft as exchange is always charged on personal checks. Always name your express office as well as your post office address in order to insure prompt delivery.

Bulb Impregnator

This is the best bulb impregnator on the market. Some dealers sell for $5 and $6. Price $2.

Breeders' Bags

Three sizes, small, medium and large. Stallions weighing 1,200 to 1,600 pounds usually require a medium size. These bags are guaranteed not to tear from any cause before March 1, 1913. If they do tear before that time return the top part with our stamp on it and 35 cents in cash and we will send you a new bag. Price, Each, $1.00.

Speculum

Made of good material, nickle plated, easily inserted, will last a life-time:

Price $3.00.

Emasculator

This emasculator (improved style) is made by the Kny Scheerer Co., and bears their trade mark. It is guaranteed to give satisfaction. If it breaks within one year or gets out of order, return it and get a new one. This instrument is made of the very best steel. It is the latest method, only having three pieces and can be taken apart very easily and thoroughly sterilized. It operates perfectly. Price, $7.00.

Veterinary Thermometers

This thermometer is recognized and used by the leading veterinarians for taking the temperature of animals. It has a metal case which insures it against breaking and will last a life-time. It has a small chain with pin in it that may be fastened to the vest pocket and carried with safety. Price, $1.25.

POSTAGE AND EXPRESS PAID ON ALL ORDERS.

CAPSULE SYSTEM BREEDING.

(Continued from page 16.)

then another capsule is filled and inserted into the next mare, and this will be followed up until all the mares are bred.

If the operator is not fully versed in diagnosing diseased mares he should wash his hands in soap and water and rinse them off in sterilized water before breeding the next mare each time. If there should be a diseased mare to be bred, that the owner insisted on having bred, explain to him that there will be very little chance of settling the mare in this condition, and by all means breed her last, so there will be no danger of transmitting the disease to the healthy mares.

While the operator is inserting the capsules only one hand must be wet, and this hand is used for inserting the capsule and should not touch anything except the inside of the mare. The other hand is dept dry. The wet hand can be inserted more easily by having a can of ground slippery elm, with holes in the top like a pepper box, and dusting the slippery elm on the arm. This can should be placed in the oven occasionally and baked and afterwards kept in a clean place.

The stallion must be educated to come up to the mare and make a mount slowly, as all stallions should do. A good, strong man should hold the mare. If this is not possible the mare should be tied firmly with a strong rein. It is an advantage to have a thick, heavy halter to put on the mare so that she may be tied firmly. The mare should also be in good heat. When several mares are to be bred a choice may be had. Some mare owners may object to having the extractor used or some may want their mares served by the stallion, but the stallion owner must run his own affairs. It is not policy to allow one man to interfere with the operations of a number of other men present.

It is not claimed that the capsule system will get all mares in foal. There are some mares that will never conceive. The most of the mares of breeding age can be made producers. Some of them, however, will need treatment. The capsule system has made producers out of thousands of mares that have failed to get in foal with the natural service, after being bred several years without results. In this way a large number of mares may be bred at one cover, so that the stallion will not be required to make a large number of services. The colts are stronger and the mares fertilize better where a less number of services are made, as the spermatozoa is stronger. Those who have been using the microscope will confirm this statement.

No rubber goods of any kind should be used in artificial breeding, as they will not stand boiling. The instrument needed in capsule breeding is a Carlson semen extractor, which is the only instrument made with which semen can be obtained from the uterus. About 60 per cent of the services inject the semen into the uterus on breeding mares. The Carlson semen extractor has been used several seasons with excellent results. It can be used either as an extractor or an impregnator. It is worth more than all the other instruments combined for artificial breeding. In fact, we believe it is the only instrument of any value for obtaining the semen from the uterus or vagina.

One should be careful to get the right kind of capsules. The ordinary capsules are not usually good for artificial breeding. Some of them do not dissolve entirely, and leave a foreign substance in the uterus and are difficult to use. The Kansas City Impregnator Company is making a pointed capsule for artificial breeding. The Carlson semen extractor and the pointed capsules can be had only from the Kansas City Impregnator Company at Kansas City, Mo.

DEVELOP THE COLTS.

The colt crop of 1911 will long be remembered by most farmers who are raising colts. These colts will be considerably smaller in size, their conformation will not be up to standard, nor will they be worth as much money, as a rule, as colts of other crops. Their nutrition on a limited supply of milk, caused by the dry pastures over the greater portion of the country last year, and the extreme heat, itself resulted in many of them having bowel trouble primarily from hot milk. In their winter quarters they have not always been supplied with nutritious feed, owing to scarcity and high prices.

In order to produce the best results colts should be fed liberally from birth to maturity, and especially during the first year. The average colt will weigh nearly one-half as much at twelve months of age as at maturity. It is necessary to keep them growing, especially during the first year, in order to insure the greatest development. If they are stunted during their infancy their forms will never be as fully developed as nature had intended. If they are not "pot bellied" they are rough and certain parts will be developed more than others leaving a bad shape.

It is far better to limit the feed of mature animals than to check the growth of the younger stock, although this would not be permissible with brood mares, owing to the danger of interfering with fetal life. While feed is expensive, at this particular time, yet it is better to spend a few dollars extra on a good colt and have it mature properly, than to check its growth to the extent that it would not be worth one-half as much money as it would have been under normal conditions. Good colts are the only ones that make a profit on their production. These are the results of good breeding, but require a sufficient amount of feed to continue their development. The average colt is not fully developed on our farms.

The proper way to raise colts is to have a self-feeder full of oats where the colts can eat as much as they care to at any time, as soon as they are old enough. Under this method there is no danger of them eating too much at one time, and their digestive organs will always be in good shape. They will stand the cold weather better, and are less liable to disease and more profitable from every angle. Five dollars worth of extra feed on the average, well bred colt, under normal conditions, will enhance the value from fifteen to fifty dollars per head. With the self feeder there is no waste and the colt knows better how much it wants than any human feeder.

All growing stock requires a good open space for exercise, plenty of good water and fresh air. A good substantial shed with a large opening on the south side where they can run out and in at their leisure, without the interference of other live stock, means development and profit.

With a little extra feed from this time until the pasture season the colt crop may be revived to a considerable extent. There are a few sections where feed is plentiful, but it is high in price nearly everywhere. Oats is the best ration for all young stock, but during the winter season a little corn may be fed occasionally without any serious injury. A great waste can be seen in our live stock development, where excellent sires are used, and the young stock allowed to be sacrificed for the want of nutrition. Occasionally a breeder will use only the best of sires and yet have very inferior colts owing to the lack of feed.

THE HORSES ON THE COVER.

The prominent part which French horses have played in improving the draft stock of this country gives us more than a passing interest in the horses of France. A good idea of what this term includes can be had by turning to the front cover illustration of this issue. All the types, breeds or crosses of importance in the industries or the breeding operations of the French Republic are represented, the names by which they are known being shown under the respective horses. The photos from which the cut was made were secured in France last summer by the editor and were taken, in most cases, from an average animal of each class.

HOLLAND DRAFT HORSES.

The Holland Draft Horse Stud Book will soon make application to the Bureau of Animal Industry to have its record recognized so that horses recorded therein can enter our ports free of duty. Holland is a very small country adjoining Belgium. The principal Holland draft horse district is next to the Flemish district in Belgium, where many of the largest and best Belgians are produced. A great deal of the land is below sea level and most of it is very flat. Many good draft sires have been used in Holland, and if their blood lines have been kept straight for many generations we would like to see those horses introduced. That type of horse is getting very popular in this country, and we doubt if Belgium will be able to supply the demand in years to come. There are only a few pure bred Belgian mares in this country and the buyers must depend largely on imported stock for this particular type. The demand has been exceedingly large during the last season for Belgian horses and more of them will be imported the coming year.

REPRESENTATIVE OF THE BETTER TYPES OF HOLLAND DRAFT HORSES.

When you buy breeding animals from our advertisers you are doubly helping in the improvement of farm stock.

TRUMANS BUY FROM THE KING'S STUD.

To the American Breeder:—We are in receipt of advice from our Mr. J. H. Truman that he has purchased from the noted Sandringham stud, owned by His Majesty King George, the celebrated Shire stallion, Golden Rock II. At the urgent request of a number of the leading breeders in the Whittlesea district, he will retain the horse there for their use, and at the end of the season will ship to Bushnell for exhibition at the leading state fairs. Golden Rock II is described as a horse of extreme size, standing on the best of feet and joints, 13½ inches of bone below the knee and of the very finest quality; beautiful silky hair; oblique shoulders; strong back and loin, with deep, well sprung rib and extreme width, weighing in three year old form, a little over an English ton.—Trumans' Pioneer Stud Farm, McDonough Co., Ill.

There is an important announcement on the back page concerning your subscription to the American Breeder. Read it.

QUESTIONS AND ANSWERS.

(Continued from page 13.)

calks,and injury to the painful soles prevented by proper protection while shoeing. This latter can often be done by covering packings of tar and oakum with a piece of sole leather or using a piece of sheet iron.

COUGH—My mare has a dry cough. I bought her about a year ago and some said it was a shipping cough, but it looks like she would have gotten over it by now, if that was what was the matter with her.—Texas Subscriber.

REPLY—Cough is only a symptom of some disorder and its successful treatment depends on removing the cause. As to what should be prescribed depends in a great measure upon the nature of the cough, as to whether it is moist or dry, prolonged or spasmodic.

First, look carefully that both the hay and grain is of first class quality and free from dust and dirt.

Procure from your druggist a pint of Parke Davis equine cough syrup and give an ounce three times a day or even oftener if the cough is distressing.

INJURED TONGUE—A stallion punctured his tongue with the bit last June. There is still an opening on top not healed over. Hay collects in the opening and I clean it out every day. What would you recommend to heal it? —Minnesota Subscriber.

REPLY—Remove all foreign material from the wound being careful that there are no particles imbedded in the tissues. If the wound does not have proper drainage that must be attended to by enlarging the opening. Wind a little medicated cotton on the point of a small stick and after dipping it into pure carbolic acid, thoroughly swab the interior of the wound, being careful not to allow it to contact the free surface of the tongue. Hold the tongue for about half a minute and then wet the wound with grain alcohol to stop the caustic effect of the carbolic acid.

If this application is repeated for a few times twice a week we predict that healthy granulations will be set up and that the wound will heal.

BRUISED FROG—I have a mare that bruised the frog of her hind foot in December and she is still lame.—Kansas Subscriber.

REPLY—If you are sure of your diagnosis you will secure the best results in the way of treatment by soaking the foot in hot water for thirty minutes twice daily and follow with a large hot poultice that will envelop the entire hoof. Continue this treatment for a week which ought to have the effect of either improving the lameness or hastening the development of an abscess which latter may be opened when formed.

SKIN ERUPTION—I bought two fillies coming three years old which have a breaking out in dry scabs which come off easy, but the hair comes off with them. The owner told me that they came off the pasture that way last fall, only they were much worse. —Ohio Subscriber.

REPLY—It is always well in treating skin eruptions of this character to first have an examination made for parasites. This will necessitate the use of a magnifying glass which can usually be supplied by your local veterinary or physician.

One of the best applications to make in cases of this kind is the kerosene emulsion solution, the formula of which has been repeately given through the columns of the Stallion and Jack News.

PINK EYE—Is pink eye hereditary or transmissable?—Iowa Subscriber.

REPLY—Pink eye is an infectious disorder and is usually treated under the name of influenza. It is not an inherited disease but seemingly is spread in the same manner as other infectious diseases.

RUPTURED COLT—I have a mule colt that when two months old was hooked by a cow and ruptured. It is now eight months old. The rupture penetrates into the scrotum or bag, and I would like to know if this colt can be castrated and cured. I always did believe it is not possible, but would like to operate on this colt if there is any chance to save him.—Illinois Subscriber.

REPLY—Before any attempt is made in the direction of an operation a careful examination should be made of the parts by a graduate veterinarian for the purpose of determining the exact condition of the same. It would be wholly impossible to intelligently advise you without such an examination.

DOES NOT RETRACT PENIS—My draft stallion doesn't draw his penis back in the sheath. He had some swelling some time ago, don't know what caused that, but that left him, but there seems to be some enlargement right in front of sack as you might say. He draws back and carries about the same generally, but the sack does not come down over the end of the penis, but can easily be put over the end with the hand, but when he lets it down and draws it back again it is the same as before. I don't know of this horse being hurt in any way, and I keep him cleaned. He is fourteen years old and has always made good semen. I work him moderately for exercise. He has a nice coat and feels well.—Ohio Subscriber.

REPLY—It is quite likely that your stallion met with some slight accident that first caused the sheath to swell. This swelling mechanically interfered with retracting the penis into the sheath properly and the muscle that produces the retraction has become considerably weakened. We infer that the skin of the sheath is infiltrated so that it does not roll inwards when the penis is retracted.

Several times a day you should manipulate and work the swollen part so that the penis may be more easily drawn into its sheath. By persisting in this the parts can be cleaned up and this mechanical resistance overcome. You should lose no time in giving this prompt attention.

NEW GROWTH—I have a mare that has a wart on the womb. People tell me that by breeding her the wart will get large. Please advise me and also, is it a very good plan to breed her at all?—Minnesota Subscriber.

REPLY—We are somewhat puzzled by your question both as to the nature of the growth and also its location. We believe the most satisfying thing for you to do is to consult with a competent veterinary surgeon with a view of having a personal examination made, inasmuch as the removal of such a growth will necessitate the services of such a man.

BURSATTEE—I have a stallion that for the last two years has got a sore on the end of his penis, and one on the lower outside sheath. Have apparently cured him each year after doctoring considerable for gonorrhoea and shanker, with medicine which I procured from a V. S., although he never explained the sore. Could he get this from a mare producing a colt every year? What is it in your opinion? What treatment can I use for mares to prevent the horse from getting this? —Montana Subscriber.

REPLY—Prevent the development of the sores this season by excluding all flies from the presence of your stallion. This can be done by screening his box stall in which he may be kept confined during the day with access to an adjoining paddock at night for exercise. Flies are carriers of infection and if you will adopt such methods as will prohibit their annoyance you will not be bothered in the future with sores of the nature complained of, unless by accident. The penis of the stallion should receive due attention as to cleanliness and should be washed occasionally with an antiseptic solution. A teaspoonful of creolin in a gallon of clean warm water applied at body temperature serves as a good antiseptic for this purpose.

PINK EYE—My mare has pink eye. She has gotten all right in every way except her eyes, which seem like she does not see well. Her eyes seem to look fairly clear to me but she looks a little sleepy out of them, otherwise she seems to be all right.—Texas Subscriber.

REPLY—It will require time for your mare's eyes to become strong again, and in the meantime she should not be exposed to bright light or sunshine. Permit her to remain in a roomy box stall away from the bright light until the conditions improve. Dissolve all the boracic acid you can in clean, warm, rain water and apply some of the solution to the eyes with a medicine dropper two or three times a day.

FEEDING FOALS BY HAND—We have tried to raise several colts by hand. Some times the mare dies, and one time a mare failed to give any milk. Nearly all these colts died. We have been careful about feeding them warm cow's milk, but the colts usually scour a few days and then die. We have been told that the milk should be boiled or fed fresh from the cow. Please explain whether we are at fault in feeding these colts.—Pennsylvania Subscriber.

REPLY—Cow's milk may be substituted for mare's milk but should be diluted at least one-half with warm water that has been boiled. The milk should always be as fresh as possible, and should be fed in small amounts and at intervals of a few nours. All vessels used should be kept scrupulously clean and made sterile with boiling water. A tablespoonfull of lime water may be added to each pint of milk which will make the milk more agreeable to the colt. The milk from a cow that has recently calved should be selected. Be very careful and not overfeed, which was perhaps the cause of the losses you have experienced. One needs to be extremely careful in this particular for the first few days.

SWOLLEN PENIS—I have an eight year old jack that had the influenza last summer, and about the time he was getting over it there was an enlargement come around his penis, near the middle of it, so large that it never has gone back in the sheath. I bathed it in hot water, also applied poultices, but was unable to get all the swelling out of same, and last week it began to swell again, and is nearly as large as ever. Would like to know of some good treatment that will reduce this enlargement.—Ohio Subscriber.

REPLY—Carefully wash the parts with a solution of sterilized water containing a tablespoonful of carbolic acid to a gallon of water.

Dip the blade of a sharp knife into pure carbolic acid for a couple of minutes, and then proceed to make about ten or twelve punctures three-eights of an inch deep into the swollen parts. In two hours after the operation carefully wash off the penis with the carbolic acid solution and apply a warm antiphlogistine pack to the parts, keeping it in place with a bandage and suspensory. The antiphlogistine pack may be continued three or four days, changing it daily.

SWEENY—My horse had the sweeny over a year ago and has never filled out yet. I have blistered him twice but it has done no good yet.—Iowa Subscriber.

REPLY—If no lameness is present it should not prove difficult to encourage these atrophied muscles to fill out. If lameness is still present, and is causing the atrophy then it should receive attention. We believe it advisable for you to consult a good veterinarian for the reason that the treatment will perhaps be of the nature of inserting setons under the skin or injecting material of an irritating nature into the parts. We suspect you are not prepared to do either of these neither do we think it advisable for you to undertake it.

SPLINTS—Please tell me where the splints come on a horse, and how to take them off.—Montana Subscriber.

REPLY—Splints occur as a rule on the fore limbs and are usually on the inner aspect of the leg between the knee and the fetlock. They are just back of the large bone that occupies a position on the most anterior part of the leg. They develop from a strain on the ligaments that unite the large bone mentioned (cannon bone) with the small bone (splint bone) located immediately behind.

Such an injury results in a bony deposit and being a strain of ligaments often produces lameness.

These bony enlargements are frequently very difficult to remove, but the persistent application of tincture of iodine twice a day often materially reduces them.

The small bony nodule that is located at the lower end of the splint bone should not be mistaken for splints.

EVERTED UTERUS—A black Percheron mare eight years old, which had foaled two colts successfully—one at five years old and one at eight, aborted December 12, 1911. She lacked two days being pregnant seven months. The act did not take more time than normal for parturition, and the afterbirth did not come away as it should. The mare still having labor pains strained until the uterus was everted. It took three or four hours before the services of a veterinarian could be obtained, then it required the strength of us both to replace the uterus, with one man to hold the mare with a twitch on her nose to prevent straining. After the uterus was in place the veterinarian sewed the vulva shut, the stitches being left in place thirty hours. The mare recovered, was, and is, in fine healthy condition. What could have been done to prevent the eversion of the uterus? Was she treated right? Would it be safe to breed her again? She weighs 1375 pounds and had heretofore always been bred to a draft stallion weighing from 1,600 to 1,900 pounds—Kentucky Subscriber.

REPLY—We think your veterinary rendered you some excellent service in saving the life of your mare for the reason that eversion of the uterus in the mare often proves fatal. The only way that such cases can be controlled is to give drugs that will prevent the excessive straining, and inasmuch as the drugs necessary to control the patient often have to be given in excessive amounts their administration should be left to the attending veterinarian. A mare that has once aborted is never as sure a breeder as one that has not. If she has cleaned up from her previous experience you will probably be justified in trying her again a little late in the season.

LICE ON HORSES—Please give us a good remedy for lice on horses. My horses are in good flesh. They are on wheat pasture when the weather will permit, and are fed bundle kafir corn with heads on in bad weather, and have shed open to the south. They are getting very lousy.—Kansas Subscriber.

REPLY—In order to get rid of lice effectively it requires a local application of some liquid agent. This is the most prompt and certain way to rid animals of lice and necessarily the condition of the weather must be taken into account when making such applications.

One of the very best as well as cheapest preparations we know of that will rid animals of lice is kerosene emulsion. Dissolve a bar of good laundry soap in three quarts of soft water by boiling. When fully dissolved and while still boiling add to it one quart of kerosene, stirring it vigorously while adding. The result will be a rather thick, creamy emulsion. Add this to nine gallons of warm, soft water stirring vigorous-while adding and use on the animal while warm. A bright warm day should be selected and the animal kept in a protected place exposed to the sun while being treated. Two men can quickly wet the animal all over, being very careful to miss no part of the body. This application not only destroys the lice but the nits as well and is harmless to the animal.

LAME JACK—Please tell me what to do for my three year old jack. He is lame in his left front leg. He wore the hair off in several places rubbing himself. He rubs the blood out in places. I gave him salicylic acid, a teaspoonful three times a day. Is that good for his blood. He seems to have some kind of skin disease. He eats hearty. Is kind of clubby in his front feet when he travels.—Oklahoma Subscriber.

REPLY—It is important to know that your jack is properly cared for before attempting to relieve his condition with medicine.

He should have a comfortable, well lighted and well ventilated box stall free from dampness, with access to a protected lot where he may be permitted to take exercise.

Give him thirty grains of potassium iodide dissolved in a little water thirty minutes before feeding grain three times a day. It may be given by means of a hard rubber syringe. Continue this treatment for a week and then in its stead give one half ounce of Fowler's solution well stirred into his grain three times a day for the same time. Alternate these two remedies for several weeks if necessary. Locally apply some carbolated vaseline to the parts rubbed on account of itching.

MARES GIVE MILK BEFORE FOALING—What is the matter with my

mare? She is with foal by a jack, and due to foal the middle of March. Her udder filled in December and the milk ran out of her teats, as if she were going to foal, and it is still running out at times. She is not droopy. I have released her from work. Is there danger of abortion?—Texas Subscriber.

REPLY—The fact that your mare has behaved in the manner described for several weeks previous to your writing and had not yet aborted, lead us to think that she will perhaps carry her foetus up to the proper foaling time. Should she show any immediate symptoms of abortion other than those mentioned we would suggest that you give her an ounce of the fluid extract of black haw in her feed two or three times a day.

WEAK ANKLES—I have a jack colt twenty months old that is weak in his ankles and has been for a year. Breaks over when he stands or walks. He is extra large and has been well fed all the time. Is there anything that will give strength to the joints? —Oklahoma Subscriber.

REPLY—The young jack should be permitted to take a sufficient amount of exercise and yet not permit him to overdo himself. Twice a day apply the following to the ankle as well as the back part of the limb above and rub in well. Oil of sassafras, oil of origanum, spirits of camphor, of each two ounces; alcohol 26 ounces. Mix all together and apply as directed. Should the parts become irritated the preparation need not be applied so often.

WART—I have a jack that has a wart between his front legs. What shall I do for it to take it off?—Nebraska Subscriber.

REPLY—We suspect that the wart is located on the parts where the skin is loose, in which event it may be drawn up so that a strong rubber band may be slipped over it, so as to include a circle of skin outside of it. Put the band on rather tight and in the course of time it will destroy the circulation thorugh the wart. In the course of ten days a still tighter band may be applied if the wart has not dropped off.

SUSPICIOUS CASE—A gelding, six years old, in good condition, that has what appears to be boils breaking out on his belly. Two years ago they broke out on him and kept breaking out and healing up for about a year. Last year they didn't come on him at all. At present he has one sore on him about the size of a half dollar. There seems to be a little pipe in it, and at times it discharges quite a bit of pus. He does not seem to have any cold, and there is no discharge at the nostrils, which look healthy. What is the matter with him, and what can be done to cure his ailment?—South Dakota Subscriber.

REPLY—The symptoms you describe so greatly resemble those of cutaneous glanders that we believe as a precautionary measure the animal should be submitted to a mallein test. Glanders in your climate is inclined to assume a slow going chronic form and a horse may be affected for years and yet during the entire period may be a source of danger to his mates. Do not encourage chances of loss in the remainder of the stock but have the animal submitted to the careful inspection of a competent veterinarian.

TAIL RUBBING—I have a stallion that is continually ruping his tail in the stall. What is the best remedy for it?

REPLY—Tail rubbing is usually due to insufficient exercise and too generous a grain diet. These two factors should be given attention in all cases of this nature. If the stallion can be enticed into eating a handful of glouber salts in his grain three times a day until a lax state of the bowels is induced, you will find it will be of great help. Should there be evidence of pin worms a gallon of warm water containing a couple of tablespoonfuls of table salt may be injected into the rectum. The region about the anus as well as the tail should be kept clean by occasional washing and brushing and if a local trouble appears to be the cause of the rubbing a solution of carbolic acid in water and alcohol will help to control the same.

IMPACTION OF THE BOWELS—I have just lost a registered Percheron mare which cost me $400, and have now a colt coming yearling, affected in the same way. When the mare was opened it was found that the intestines were clogged with a ball of alfalfa four or five inches in diameter. It is impossible to get the bowels to move, using salts. She was fed on all the alfalfa she would eat, and two quarts of corn twice a day. She was tied up at night and turned out for exercise and water through the day. Several horses have died recently the same way. Is there any remedy for the trouble, and what would be a preventative?—Colorado Subscriber.

REPLY—While alfalfa is one of the best forage plants we have, it should never in its cured state be fed to horses in full amounts as mentioned in your letter. The man that follows the practice of feeding horses all the bright alfalfa hay they will consume invites disorder. The brighter and better the hay the greater the danger.

Horses grow exceedingly fond of alfalfa and eat too much, resulting in indigestion and impaction. Alfalfa hay should be apportioned out to horses in definite amounts just the same as their grain, and other forage should constitute a part of the ration.

WORMS—My horses that ran in the pasture last summer got poor in the fall on good pasture. This winter I have been putting them in the barn and feeding them good on corn, oats and oil meal. They pass a good many worms—some are red and small (about one-half to three-fourth of an inch long) and they are filled with blood and seem to be pointed at both ends. Horses get poorer all the time. Some of them will die.—Illinois Subscriber.

REPLY—We fear you are going to experience considerable trouble before you effectively rid your stock and premises of this variety of worms.

It is quite likely that your stock is infected with some of the blood sucking varieties, either the strongylusarmotus or schlerostes are inclined to find their way into the blood vessels of the bowels where they interfere with the circulation and sometimes cause colic symptoms and death.

They may be dislodged from the bowels by means of physics and perhaps the best agent to give is powdered aloes preferably in bolus but it may be given in a half pint of warm water. For an average sized horse give an ounce of the powdered aloes and combine with it thirty drops of coal tar creosote. Repeat the purge in from ten days to two weeks.

INJURED PENIS—I have a good stallion, eleven years old, that has a penis badly out of commision. About two monthe ago a swelling suddenly started on the front side of his penis, about half way the length of it. It came suddenly and inside a week the organ was twenty-four inches in circumference, the swelling gradually went to the lower end of the penis. Just the skin was affected, the main penis was not. I washed it every day with a medium solution of bi-chloride from the first, but the skin began to emit a yellowish, watery secretion. Nothing came or comes from the water or semen passage. Then a brown scab formed over about one-half the surface of the penis, and a light yellow pus formed under the scab. About a month ago I detected a soft spot in the main swelling and lanced it (after boiling the kinfe I used) and a pint or so of pus run out. I lanced from the under side of the swelling, so it would drain. This opening has now closed. Pus seemed to drain entirely out. The skin has nearly recovered the penis now, but the swelling, after receding about half stays about the same, and in that one place (in front and half way down, the back and sides did not swell to amount to anything) is hard and sensitive. I fed him F. E. Bucho in his grain three times a day for a month or so, at first, and as he was somewhat thin when this trouble came on I gave him sulphate of iron with powdered gentian. Am still giving the latter. I grained heavily after this came on, but he steadily went down, but about the time I opened the pus sack he begun to do better and is now feeling fine. He has had ample exercise all along, running in a lot fifty yards square when not too cold. After the sores became raw I used a powder of iodoform, tannic acid and corn starch, tied a boiled rag loosely around it leaving opening for urine. Urine has not been in the least affected. As I live one hundred miles from a veterinary wish you would advise.—S.Dak. Subscriber.

REPLY—There is no treatment that will as effectively relieve the present condition as patient massage. Begin carefully and three times a day knead and manipulate the parts with the hands until it is softened up. Do not overdo matters on the start, but persist in the treatment. In the course of time the parts ought to improve by getting soft and pliable. They will perhaps fill up during the intervals, but be patient. A careful system of increased exercise will be of help.

RUPTURED MARE—What would you do for a mare that is ruptured at the navel? There is a hole about the size of a quarter or a little larger. This mare is four years old and has had one colt, and did not have any trouble. Is there anything to be done for her and is there any danger of losing her? I think probably she has always been this way, or at least since a yearling colt.—Indiana Subscriber.

REPLY—This mare has reached an age that makes it difficult to effect a cure by means of a surgical operation. With an opening no larger than the one described there is not much danger of strangulation of the bowels taking place. If she is bred repeatedly, however, it increases the danger for the reason that the weight of the foetus inclines to expand the opening.

OBSTNATE WOUND—I have a jack that has a sore on the inside of his hock joint, which seems raw, and looks as if there might be two warts there. No swelling. I can't get it healed up. Has been there for more than a year. Would like to know what to do for it.—Indian Subscriber.

REPLY—The proper thing to do is to have your jack examined by a competent veterinarian for the purpose of determining the nature of the wound, and also ascertain if there are warts present. The best and most certain way to remove the warts is by surgical measures which your surgeon should do if they are found.

LAND FOR PERCHERONS

I Have 80 Acres of Good Land In San Luis Valley, Colorado.

Ten miles from Alamosa and full water right that I will **trade for one stallion and one mare.** Both must be imported Percherons and good sire and quality. **A. Apland, Huxley, Story County, Iowa.**

COMBINATION STOCK AND GRAIN FARM.

An A1 value for sale on good terms. 400 acres and good improvements, only 12 miles from the Agricultural College. Price $70.00 per acre. Also good residence and business lots in Manhattan. **Helder & Hostrup, Manhattan, Riley County, Kansas.**

320 ACRES OF GOOD PRAIRIE LAND.

In good farming country, located between Holt and Knox County, Nebraska. Black, sandy loam; 30 feet to water; 8 miles to nearest R. R. town (PAGE) at $25 per acre. Will take in one Percheron stallion coming 3 and a few Percheron fillies. Must be registered in Percheron Society.

I have one Percheron stallion, coming three, sound and hard to beat, for sale at $500; or will exchange him for one of equal value.

S. S. Langford, Craig, Burt Co., Neb.

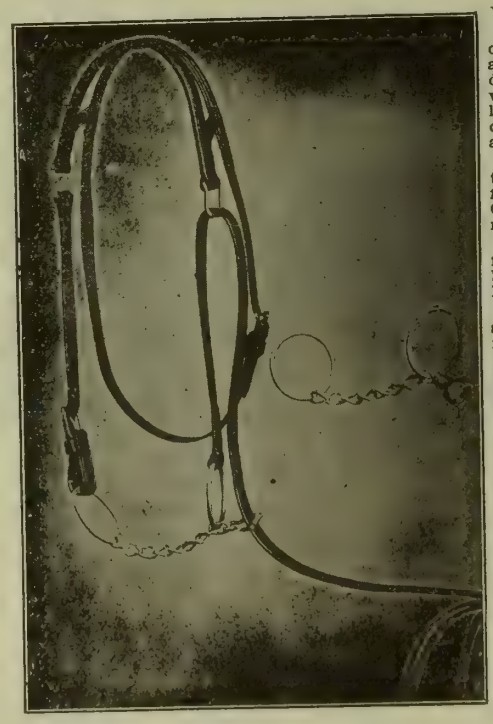
EGGS OF INDIAN RUNNER DUCKS.

From imported blood. Noted for shape; wonderful egg production; large white eggs. Grand prize record. **M. H. Schlotzhauer, Indian Runner Duck Specialist, Pilot Grove, Mo.**

STAPLES' BLACK LANGSHANS—Great winter layers. Some choice young cockerels, the best I ever raised. Some choice Duroc Jersey swine, young stock; male, females. Write today. Plainview Farm. Mrs. Jas. A. Staples, Mgr., Lamonte, Mo.

Buff Orpingtons

Eggs from Standard bred hens. Cock, golden buff, scoring 95 by Russel; 15 eggs, $3; mature pullet eggs, $1.50. **Carl D. Adams, Olathe, Johnson County, Kansas.**



SINGLE COMB BROWN LEGHORNS

Eggs. The great all year laying strain. None better. My method for range insures strong, vigorous chicks, with vitality. Satisfaction guaranteed. $1 per 20; $2.50 per 40; $4 per 100 eggs.

Mrs. H. A. Brookhart, Arabela, Scotland County, Mo.

Johnson Automatic Stallion Bridle

Patent Applied for Nov. 10th, 1909.

Manufactured exclusively by Peter Young, Assumption, Ill.

Controls the most unruly stallion without injury and will not hurt the kindest and most docile horse. Fits the largest draft stallion or the smallest roadster without adjustment. Made of the best leather. Shipment will be made on receipt of order, as I have them in stock at all times.

Order one, and if not satisfactory, return it and your money will be cheerfully refunded. Price $5, with order. Can be sent by mail. Read these testimonials:

"Enclosed you will find check for $5 for which send one of your stallion bridles to Mr. Jacob Haning, Minier, Ill. Please send at once and oblige.

"P. S.—I have been using one of your stallion bridles for some time. Would not do without it, as you soon have perfect control of your stallion in a short time. Please send bridle to Mr. Jacob Haning at once. Send by mail. Val. Thomas, Jr., Hopedale, Ill."

"I have used the bridle but a few days which I recently purchased from you, but must say no horseman can afford to be without it. It will hold any horse. There is no equal to it. I advise every horseman to have one. E. A. Berlin, Waterloo, Wis."

"Will say the bridle I ordered came all right. The horse that we wanted it for was one that we could not use with a chain under the jaw. Had to use rein over his neck and hard to hold back at that. The bridle surprised him very much. My son says he cannot say too much for it. De Mott & Son, Scottsbluff, Neb."

PETER YOUNG,

Assumption, Christian County, Illinois.

AUCTIONEERS MAKE BIG MONEY

How would you like to be one of them and make from $10 to $100 per day?

We paid $300 for our 1911 96-page illustrated catalog. You can have one by writing us a postal today.

ABSORBINE

REG. U.S. PAT. OFF.

Will reduce inflamed, strained, swollen Tendons, Ligaments, Muscles or Bruises, Cure the Lameness and stop pain from a Splint, Side Bone or Bone Spavin. No blister, no hair gone. Horse can be used. $2 a bottle delivered. Describe your case for special instructions and Book 2 E free.

ABSORBINE, JR., the liniment for mankind. Reduces strained, torn ligaments, enlarged glands, veins or muscles—heals ulcers allays pain. Price $1.00 a bottle at dealers or delivered.

W.F.YOUNG, P.D.F. 388 Temple St., Springfield, Mass.

Our Harness Horse Talk

The Difference Between "Because Of" and "In Spite Of," As Illustrated By the Case of Antevolo. The Fastest Pacers and Their Top Crosses.

Written for the American Breeder, by Henry Ten Eyck White

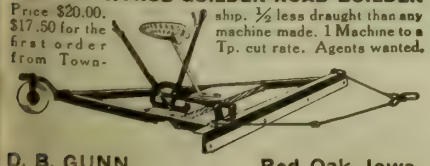
Certain ghost worshippers are having an exciting time just now anent the death, at the ripe age of 31, of the trotting stallion, Antevolo, a steed which in bygone days was reckoned to be of considerable account as a possible sire, and whose total contribution to the annals of the breed of which he was a member was 14 trotters and five pacers; nine speed siring sons which got five trotters and eight pacers, and nine daughters which are the dams of nine trotters and three pacers.

The reason for the renaissance or exhumation of Antevolo by a few of the faithful lies in the fact that in the misty past he was one of the most vaunted exponents of the theory that the blood of the Thoroughbred, delivered in large quantities and near crosses, was of surpassing value in the making of trotters that would do to go to the races with, and later use for the propagation of other trotters of like caliber. And, to tell the whole truth, there was a time when Antevolo and his immediate relations were bright stars in the trotting horizon, although for many years they have been absent from even the feeblest constellation.

It all came about in the time when fathers of present day families were callow youths, and Governor Stanford of California, aided, abetted and encouraged by Joseph Cairn Simpson, a very good horseman of that day, were the joint authors of the excitement. Simpson, while a resident of Iowa and Illinois, owned a stallion, pretty much thoroughbred in his lineage, called Blackbird, which nag, by dint of patient training, he developed to the extent that he secured a record of 14:33 for five miles, the same being a shade better than a 3-minute clip for the entire distance.

Before going from the Middle West to California, Simpson mated his pretty nearly thoroughbred horse, Blackbird, with a daughter of a stallion called Rattler, and secured a gray colt which he named A. W. Richmond. Then he bred A. W. Richmond to a mare by the first class thoroughbred sire, Bonnie Scotland, and the foal was a filly afterwards known as Columbine. Now listen: Blackbird, sire of Richmond, could (and did) trot five miles at better than 20 miles an hour—which was as fast as the average railroad train traveled in those days—hence he had, by the laws of heredity, a chance to sire speed. Bonnie Scotland, although bred for running, and the sire of many distinguished runners, nevertheless was of rather plastic blood which blended kindly with strong trotting strains, as witness the fact that when he was bred to the Pilot Jr. mare, Waterwitch, he sired Scotland, trotting record, 2:22½. So Columbine had two well defined strains of trotting blood in the sense that it had produced trotters, and A. W. Richmond, sire of Columbine, was a good begetter of speed, as with not much opportunity in California he got nine trotters and three pacers, and two of the trotters, Romero, 2:15, and Richmond, 2:19¼, were above the average, the former showing around 2:12 to high wheel sulky back in 1883. He, however, had a well bred dam, she being a daughter of Mambrino Pilot (son of Mambrino Chief and a Pilot Jr. mare), which same strain figures today in the pedigrees of two of our most distinguished brood mares, Santos (dam of Peter the Great, etc.), and Sorrento (dam of The Bondsman, Jayhawker, et al), their sire, Grand Sentinel, being from a daughter of Mambrino Pilot.

Simpson naturally regarded Columbine as the making of a great brood mare, and his position was a logical one. But when it came to picking a stallion with which she should be mated it is interesting and important to know that Mr. Simpson, despite his long advocacy of close crosses of thoroughbred blood to produce trotters, did not send Columbine to a horse bred that way—of which brand there was more than one in California—but instead shipped her to the court of Electioneer, a trotting bred stallion that could trot a 2:20 clip in stud condition, and whose dam, Green Mountain Maid, was such a fast natural trotter that in her youth crowds would go up Sunday mornings to the pasture where she was kept to see her show terrific speed at the trot when chased by a dog brought along for that purpose.



Electioneer, as the world knows, got high class colt trotters from various sorts of brood mares that were not even of the first class in their day, beginning with daughters of the pacer, St. Clair, whose blood lines are wholly unknown, then going to daughters of Mohawk Chief, and finally to those of Gen. Benton, which stallions today are in the books principally because Electioneer got some trotters from their daughters. So it was rather to be expected that Electioneer would do well when mated with Columbine, which had in her pedigree some blood that already had produced trotters. And he did. He got Anteeo, a real good trotter, 2:16½, and Antevolo, 2:19½, both stallions bred by Mr. Simpson. Later the family was increased by J. C. Simpson, 2:18¼, and Coral, 2:25.

Anteeo and Antevolo, the first foals of Columbine, were such good trotters they sold for enormous prices when the time came for them to enter the stud, the first named going to Michigan and thence to Pennsylvania, fetching $30,000 the first time and a good deal more than that the second, and the Pennsylvania man who got him was so enamoured of his purchase that (this is cold fact), he permitted people other than himself or the employes of the farm to see the horse only upon presentation of a card issued and signed by himself. Perhaps a little precaution was just as well, for Anteeo was a fighter, and one night while owned on the S. A. Browne farm at Kalamazoo, Mich., he burst loose the door of his own stable, then walked around the corner and broke down a fence inclosing the paddock of Empire, another of the farm stallions, and finally broke into the box stall of Empire and tried to kill that horse.

The sons of Columbine unquestionably have done well (though not as well as expected) in the speed siring line, and no excuses need be made for them on that score. But they certainly were not what would be called successful sires, and their blood has pretty well run out. Not one of them got a high class trotter or pacer, nor have their sons or daughters become conspicuous in the matter of speed production. That thoroughbred blood, to which so much was attributed when Anteeo and Antevolo were trotting and when they were being sold for fabulous prices, did not help them as speed sires, nor is it of record that their descendants (plentiful in numbers and trained assiduously lo these

GUNN'S 2 HORSE GUILDER ROAD BUILDER

Price $20.00. $17.50 for the first order from Town-ship. ½ less draught than any machine made. 1 Machine to a Tp. cut rate. Agents wanted.

D. B. GUNN, Red Oak, Iowa

The Importance of Clipping Horses

before they are put at the hard spring work is now recognized as the proper thing by progressive farmers everywhere.

Horses are soft in the spring and sweat easily. Long hair holds this sweat and dirt, making it difficult for the skin to perform its functions properly. The wet coat is slow to dry, too, and leaves the horses liable to coughs, colds, pneumonia, and other ills. ***Clipped horses dry out quick,*** rest well, and get more good out of their food.. A blanket, on cold nights, is much better than long, wet hair. Clipped horses look better, feel better, and do better work every time.

You can clip a horse in 30 minutes with the

Stewart Ball-Bearing Clipping Machine, *only* $7.50

It is the finest clipping machine ever made. We have been making clipping machines for 20 years and it is our masterpiece. It's the only ball bearing clipping machine. The gears are all cut from solid steel, are made file hard, and are shut in away from dust and dirt. They run in oil, too, doing away with almost all friction and wear. The knife is the famous Stewart single nut tension pattern, highest grade. ***So good is this machine that we guarantee it to you for 25 years*** No other machine ever made is so well worth the money.

You can get this machine from your dealer, or send $2.00 and we will ship C.O.D. for balance. Get one NOW. Write for big, new catalogue.

SAVE MONEY ON HARNESS

OUR PRICE WHOLESALE $26.65 AS SHOWN, LESS COLLARS.

This **New "Favorite" Team Harness** is only one of many that we offer at a money-saving price and it is a fair sample of what we can do for you in the harnessline.

THE NEW "FAVORITE" HARNESS

is made of an exceptionally good grade oak-tanned leather, in the style shown. It is very popular, both for farm work and city teaming, made to prevent sore backs, warranted to stand up under general farm work, and to give splendid service. Our guarantee of **satisfaction or money back goes with every set.** If you wish to do so, we will allow **30 DAYS FREE TRIAL** to show our confidence in this harness, which we guarantee **for one year from date of purchase.**

OUR FREE HARNESS CATALOG describes the **New "Favorite"** fully, also a complete line of harness, harness parts, robes and buggies, blankets nets, saddles and vehicles of all kinds. Be sure to get this book if you are in the market for anything in the **Harness** line from a strap to a full set. Write today for this book.

JONES, POST & CO. "THE HOUSE THAT SAVES YOU MONEY."
1403 West 9th St., KANSAS CITY, MO.

THE RIGHT WAY

IN ALL CASES OF
DISTEMPER, PINKEYE, INFLUENZA, COLDS, Etc.
Of all Horses, Jacks, Mules, Brood Mares, Colts, Stallions, is to

"SPOHN THEM"

On their tongues or in the feed put Spohn's Liquid Compound. Give the remedy to all of them. It acts on the blood and glands. It routs the disease by expelling the disease germs. It wards off the trouble no matter how they are "exposed." Absolutely free from anything injurious. A child can safely take it.

50 cents and $1.00; $5.00 and $10.00 the dozen. Sold by druggists, harness dealers, or sent, express paid, by the manufacturers.

Special Agents Wanted.

SPOHN MEDICAL CO., Chemists and Bacteriologists, Box 834, GOSHEN, IND., U.A.S.

Don't Have a Blind One "VISIO"

An Absolute Cure for **Moon Blindness**

(Opthalmia), Cataract and Conjunctivitis
Shying horses all suffer from diseased eyes.
"Visio" will convince any horse owner that it will absolutely cure defects of the eye, irrespective of the length of time the animal has been afflicted No matter how many doctors have tried and failed, use "VISIO" under our GUARANTEE to refund money if it does not cure.
$2.00 per bottle, postpaid on receipt of price.

thirty years) were especially game. Still, as the Boston eidtor who burns incense before the picture of Diomed (first Epsom derby winner) truly says in referring to Antevolo: "His second dam was a thoroughbred daughter of imported Bonnie Scotland; third dam Young Fashion by imported Monarch, and fourth dam Fashion, the greatest race mare in America in her day. She made a 4-mile race record of 7:32½ in a race that was won from the renowned Boston in 1842, which was then the fastest time ever made in a 4-mile race."

It reads fine in the obituary, but it doesn't fool anybody.

The other day it occurred to me that much interesting information might be gained by making a list of the 2:05 or better pacers and running them out two generations in the male line, just to see what strains were the most potent.

But after my list was ready I cut it to 2:04 pacers, and a little later made it 2:02 or better so as to keep within the limits of eagerness with which the horse lover will devour the right sort of statistics and the comments thereon and avoid the point where he is surfeited and becomes stale. And I found the 2:02 list plenty big enough for my purpose. Here it is, the sire and grandsire of each performer being given, so that in practically every case it is an easy matter to decide to which family or strain of blood the nag in the left hand column belongs. The female side of their pedigrees is another matter:

Name.	Record.	Sire.	Grandsire.
Dan Patch	1:55¼	Joe Patchen	Patchen Wilkes
Minor Heir	1:58½	Heir at Law	Mambrino King
Audubon Boy	1:59¼	J. J. Audubon	Alcyone
Star Pointer	1:59¼	Brown Hal	Tom Hal
Prince Alert	1:59½	Crown Prince	Artemas
Dariel	2:00¼	Alcander	Alcantara
J. R. Gentry	2:00½	Ashland Wilkes	Red Wilkes
Lady Maud C.	2:00½	Chitwood	Nutwood
Ess H. Kay	2:00¾	Direct Hal	Direct
The Broncho	2:00¾	Stormcliffe	Wickliffe
Bolivar	2:00¾	Wayland W.	Arthur Wilkes
Hedgewood Boy	2:01	Chitwood	Nutwood
Copa de Oro	2:01	Nutwood Wilkes	Guy Wilkes
Joe Patchen	2:01¼	Patchen Wilkes	Geo. Wilkes
Ross K.	2:01½	Constanero	Constantine
Robert J.	2:01½	Hartford	Harold
Little Boy	2:01½	Kenton	Harkaway
Independence Boy	2:01½	Thistle	Sidney
Anaconda	2:01¾	Knight	Woodford Wilkes
Citation	2:01¾	Norvalson	Norval
Ecstatic	2:01¾	Oratorio	Wilkes Boy
Angus Pointer	2:01¾	Sidney Pointer	Star Pointer
Dan R.	2:01¾	Tasco Jr.	Tasco
Evelyn W.	2:01¾	The Spy	Chimes
George Gano	2:02	Gamb. Wilkes	Geo. Wilkes
Vernon McKinney	2:02	Guy McKinney	McKinney
Coney	2:02	McKinney	Alcyone
Locanda	2:02	Allerton	Jay Bird

This tabulation puts the matter in vignette form as to space taken, and also, as in the case of vignettes properly done, it brings out what the seeker is after in very plain fashion and acute relief.

And, as with nearly all sorts of statistics having to do with the trotting horse, the value of the Wilkes blood is emphasized in such fashion that even the careless man must note the fact.

Another point which is personally gratifying to me is the fact that my favorite son of George Wilkes, the mighty Alcyone, shines in this table with a shade brighter luster than does any other horse, as no less than three members of the 2:02 pacing list run to him in the male line, they being Audubon Boy, 1:59¼; Vernon McKinney, 2:02, and Coney, 2:02. Another, Dariel, 2:00¼, goes in the male line to Alcantara, brother to Alcyone. Another Wilkes horse that shows double in this list is Wilkes Boy, his representatives being Ross K., 2:01½, and Ecstatic, 2:01¾. And yet in the last few years the trend of popular favor in the breeding world has been rather away from Wilkes Boy, and now that one of his best sons, Grattan, is dead, the strain is nothing like what it was half a dozen years or so ago.

Guy Wilkes shows twice in the table through Bolivar, 2:00¾, and Copa de Oro, 2:01, and that is another branch of the Wilkes family that in the male line is not as prominent as it was. Nothing is so foolish as to ignore the facts as shown at the close of each season of racing in relation to any strain of blood that has been, or is, prominent. When the sons and daughters of Guy Wilkes were winning grand circuit races under the masterly training and driving of John Goldsmith it looked as though that branch of the Wilkes tribe had indeed come to stay, but go over the ground today and see if you can find a son of Guy Wilkes among the leading speed begetters of the last three or four years.

The blood of another one time famous California sire, Sultan, has died out in much the same way, while that of two other horses of the same period and environment, Electioneer and Director, has more than held its own. And in the meantime McKinney, then in California, has come on and done things, in some respects, no other horse can lay claim to, his 2:10 trotting list, for instance, and he left as good a son in Zombro, as was any of Electioneer's at a like age. Constant change of blood in his stallions must be made by the breeder who will keep

SAMPLE FREE

BROWN FENCE

15 to 35 cts.

Per Rod Delivered

You can examine Brown Fence and know just what it is before ordering or paying one cent. We mail you a sample showing size and quality of wire. When you get the sample, test it with a cold chisel and see how hard, tough and springy it is. File off the galvanizing and see how thick THAT is. All wires—both strand and stay wires—are No. 9 gauge, and made of the best grade of steel. Weighs ⅓ to ½ more to the rod than most fences, and will last double the time. A more rigid, firm, stanch, stock-resisting, time defying fence was never stapled to posts. Price 15c to 35c per rod, and we pay the freight on 40 rods or more. Write for catalogue showing 133 styles of fences. We also sell direct to farmers at lowest wholesale prices—Coiled Spring, Barb and soft Galvanized Wire, Gates and Poultry Netting. Save money by ordering direct from us. Address

Saddle and Speed Horses

AT

PUBLIC SALE

March 21, 22, 23

Saddle horses that can win in any company. Business saddle horses. Lady broke saddle horses. Ten head of young saddle stallions. Some registered saddle brood mares. Speed horses good enough to win on the grand circuit. These horses are right, not "has-beens." Ten head of good breeding jacks, also in the sale. I make my statements good. If interested, write me.

ONWARD WILKES FARM, JAS. HOUCHIN, Proprietor.

Jefferson City, Cole County, Mo.

Bargains in Horse and Jack Stock

We have one black, five year old imported Percheron Stallion; one four year old grade Percheron Stallion, unusually good.

One black four year old Jack, extra good bone and ears; and one black jack nine or ten years old, the largest there is in the country.

Also Hackney, Welsh and Shetland Ponies; Standard bred and other harness horses.

We have a big stock farm, 1,400 acres, and are raising our own horses, ponies, mules, jacks and jennets, and we think we can sell young stuff cheaper than any dealer.

We are right up to the season when these stallions and jacks will begin earning money, and they are all in excellent condition.

In case I am notified, I will be glad to meet any prospective buyer at the Frisco, Santa Fe or Missouri & Kansas Interurban stations.

up with the fashion, and fashion, in the breeding of harness horses, means the latest and best speed. Today everybody wants the blood of Peter the Great, Bingen, Todd, Moko or one of the three or four other stallions. And similarly the Arion mares are being snapped up because they are doing things in the speed production line. Years and years ago their sire was hailed as the coming fountain of speed, and stood at the unheard of fee of $2,500, dropping down to $100 in a few years when it was certain he was no great sire. Now his daughters are producing race horse speed, and the cry goes forth that Arion will be in the days to come another Nutwood (His dam was by Nutwood), as a sire of brood mares.

TEASING POLE.

For those who do much teasing, a good, substantial place to try the mares is essential. It should be so arranged that neither stallion nor mares are liable to injury. It should be about three and one-half feet high for the average mares. It is better to have it boarded up on the side, next to the mare with smooth, two-inch planks. The top of it should slant away from the mare, about four inches at the top. Then, if a mare should kick, she is not liable to skin her hocks. The top of this pole should be perfectly smooth at both ends, as occasionally a stallion may climb over the pole, and if he should come in contact with a sharp point or corner a valuable animal might be ruined. If there is any doubt about the stallion having a desire to jump over the pole, another pole may be put up about three feet higher, so that when he encounters the top pole it will prevent him from going farther. This should also be very smooth as occasionally the stallion wishes to get his head away reasonably quick and if he should encounter this pole an injury to the head might be the result. A better method is to educate the stallion that he is not to make a service while the mare is in this position. Have a regular place where the stallion is to make the service, then he will not have so much desire to jump over the pole. A pole can be put in front of the mare in such a way that she cannot go forward, and a large ring can be fastened to the teasing pole where the halter rope may be run through it, so as to keep her head reasonably close to the stallion. When a mare is being teased she should not have on a severe bridle, neither should her head be tight. If there is any pain or much excitement the mare is not liable to show signs of heat. It is usually better to tease quietly for the best results.

RUBBISH THE RIGHT NAME.

To the American Breeder: I am an old subscriber to your paper, and have been in the stallion and jack business for thirty-five years. I wish to call your attention to a little paper called the * * * * * * * * * * * managed by * * * * * of Kansas City, Mo. Last year he put out what he called a barren mare impregnator, for $5, consisting of a little rubber funnel to be inserted in the neck of the mare's womb before stallion service, then let remain for a few minutes, then remove and the mare is bred. He put those out with a guarantee that if they did not give satisfaction he would refund the money. So I gave it a fair trial on about twenty-five mares. It would not stay in place. Of course it proved to be a complete failure. I sent it back to him and wanted my money back, as he agreed to do. But no, he wanted to pay me off in some more rubbish. I told him I did not want anything more to do with his rubbish, but he keeps sending it to me just the same. I would be glad for the public to know what kind of a goat he is.—H. T. Robinson, DeKalb county, Missouri.

SCARCITY OF JACKS.

There never was a time in American history when good, big jacks were more difficult to find for sale. Only those who have been hunting them can realize this important feature of the horse breeding industry. During the coming season nearly every jack of any value will be taxed to his utmost. Jacks are beginning to bring their real value. There is no other animal that will make any more profit than a good jack in a community where his value is appreciated. They are no more bother to take care of than a cow, for men who are familiar with them. The owners of good jennets certainly have a bright future if they will use the best sires obtainable, and thoroughly develop the young.

JACKS AND MULES.

Recognizing the great and growing importance of the jack and mule business, we are preparing a new series of articles devoted exclusively to these classes of stock. Nearly every stallion owner is interested in this subject, although its literature has been too much neglected. There is scarcely a breeder in the country that is fully familiar with the different jack breeds, or the best types, and the same may be said about mules. We will run photographs of the different breeds of jacks and the different market types of mules, which should have much educational value for all interested in either the hybrids or jacks.

G. C. ROAN'S SALE POSTPONED.

To the American Breeder:—My big two-day jack sale that was to have taken place at La Plata, Macon county, Missouri, February 26 and 27, has been postponed owing to the terrible blizzard that raged at the time of the sale, making it impossible for any of the 48 trains that were due at La Plata on the sale date to reach that point.

The sale will be held on March 14 and 15, just as originally advertised and set out in the catalogues. There was not and there will not be a jack or jennet sold until these dates.—G. C. Roan, proprietor, La Plata, Macon county, Missouri.

"I GIVE MUCH CREDIT TO YOUR PAPER."

Frank B. Graham, Esq., Kansas City, Missouri:—Find enclosed my check for $45 for sale advertising. My sale was a success, and I give much credit to your paper as a medium for furnishing buyers.—Dr. W. E. Cheatham, Excelsior Springs, Mo.

When you buy breeding animals from our advertisers you are doubly helping in the improvement of farm stock.

A good home and experience. Will refer to Murray Bank or Domestic Stock Raisers, this city. **Dr. John T. Jackson, Murray, Clarke County, Iowa.**

Astride Riding Here To Stay

SEEKING HEALTH AND PLEASURE ASTRIDE, ELDORADO SPRINGS, ARK.

Written for the American Breeder By Samuel A. Leath, Harris, Ark.

To state the exact date when fair woman first rode astride is beyond the knowledge of the most ancient writers; however, women rode astride more than eight hundred years before any attempt to design a side-saddle.

During the heated battles of early history women would frequently steal a soldier's horse and flee for aid, to check the destruction of property, by the enemy. For six hundred years women rode in the rear of their husbands, brothers or fathers and held to the waist-belt of their attendant's coats. Not even were any saddles for the men during this period of six hundred years—a large pad was used instead.

One among the first designs of a saddle, exhibited for real service, was carved out of a single piece of wood and had neither girth nor stirrups. Then came into existence the old wooden tree pommel and cantle carved out of the one piece of timber; with other wooden shafts extending down on either side, suspended by wooden pins, to which were pinioned (at the bottom end) two very clumsy foot-rests, not even bearing the name or resemblance of our modern stirrups. Even after these rugged shaped saddles were pressed into service, the women continued to ride astride and to the rear of the same horses with their protectors. And again, we have information concerning the mechanism of an ancient saddle with a very costly breast-shield to hold the saddle in proper place on the horse; the idea of a girth not even at this date being presented to the genius' mind.

Doubtless you recall the story of the "Flying Girl;" written by Edyth Van Dyne; the story is full of spicy adventure and treats on out-of-door life, health, vigor and rosy cheeks. Another interesting bit of history is the adventures of Peggy Owen, a Quaker girl of Philadelphia, who was photographed astride of her horse, en route to Virginia to nurse a cousin, who was an English officer, that had been wounded and placed in prison by the British. Peggy encountered many trying scenes, while en route to Virginia, and she, too, was captured by the British under the traitor, Benedict Arnold. Then the writer recalls what was done by one of our ancient queens, who unfortunately, was deformed and could not ride astride as was the custom. Therefore, one of the queen's nobleman friends procured the services of a mechanical genius, and designed a chair-like seat, that was girdled upon her horse to permit of her presence in an important parade.

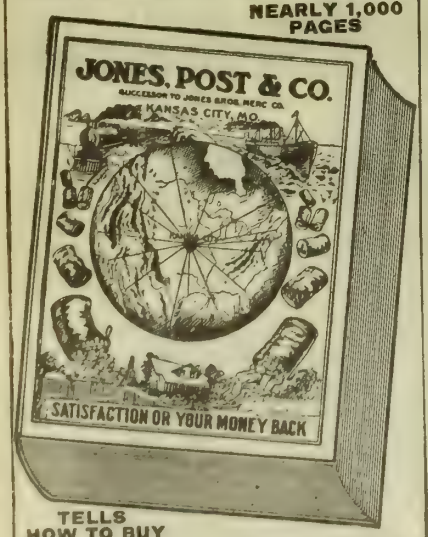
Our ancient mothers and women of note felt very kindly toward the astride method of riding until the beginning of a more important event, and that was the beginning of the "hoop-skirt" fad, and it was then that another queen besought the genius of man to invent a side-saddle, the date being much less than one hundred years ago. And as every woman wore the new "hoop-skirt," of course, no more astride riding was done till about fifteen years ago. Of course, the modern woman, or a few of the Southern mothers, protested and declared it a disgrace to ride astride—little considering that no other custom was known for over eight hundred years.

The writer had the pleasure of serving nine years' time as solicitor and riding instructor for a noted saddle horse concern in a very popular resort, where more than 51,000 riders were recorded from one single hotel in the space of forty-nine months. Many of the tourists were sent there by the advice of their physicians and urged to ride, and ride astride, for the physical benefits derived from such out-of-door exercise. Astride riding has met with the approbation of our most competent medical profession, and at the same time brought great relief to the feelings of our faithful equine servants.

A few of the numerous benefits from astride riding are due to the perfect circulation, as every muscle in the entire body and limbs is brought into play. Of course, no strain or tension is necessary, consequently, the rider is much more independent and can control the horse under emergency to greater advantage. The humane societies of many states have prohibited further use of side saddles, and no greater kindness could be tendered our noble horse creation than to forever discard all other but the modern astride method.

The enthusiastic lover of a breed of any kind of live stock is the successful one.

40 MULE COLTS AND 40 HORSES.



Forty mule colts, from high grade mares, and out of registered 16 hand jack; with plenty of bone and substance.

Forty head of horses, from select mares and high grade stallions. All good colors; ages from 1 year to 3 years old. Phone 58. 1 short, 1 long and short. **W. D. Berry, Floydada, Floyd County, Texas.**

JONES, POST & CO. 1401 West 9th St. Kansas City, Mo.

TWO JACK AUCTIONS TOTAL $53,630.

Two public sales of jacks and jennets made the fore part of this month, brought a total of $53,630. In all 104 head of stock were old—61 jacks and 43 jennets.

The sales were those of L. M. Monsees & Sons, Smithton, Mo., and W. J. Finley, Higginsville, Mo. The Monsees sale, in which 44 jacks and 26 jennets were sold, totaled $36,545, the jacks averaging over $700 and the jennets about $215. In Mr. Finley's sale 17 jacks averaged $760 and the jennets (the same number) averaged over $245.

In the Monsees sale one jack (Barytone Mammoth, that has sold as high as $3,000) brought $2,500, the buyer being J. T. Ernest of Ft. Gibson, Okla. Missouri King, in the same sale, went to D. J. Hutchins, Sterling, Kas., for $2,000. The top jennets, at $505 and $520, respectively, went to T. E. Collins of Belleville, Kas., who formerly owned Missouri King.

Top prices were not so high in the Finley sale, but the averages were higher, prices being very uniform. Dr. Lee, by Dr. McCord, sold for $1,400 to G. W. Knous, Knobnoster, Mo., and a 2-year-old jack sold for $1,100 to G. D. Burch, Winford, S. D.

PLEASANT VIEW PERCHERON STOCK FARM

I have for sale a choice lot of imported and home-raised Percheron stallions and mares. A number of them are sired by the famous horse Barnum, that was champion at the International in 1904. Prices reasonable. Come and see them and I will save you money. Marcus is located 44 miles northeast of Sioux City on the I. C. R. R., in Cherokee County.

Chas. P. Quirin, Marcus, Iowa.

IMPORTED PERCHERONS AND BELGIANS

Stallions from 2 to 4 years old. All acclimated and sure foal getters. All solid colors, black, gray, sorrel and bay, and broke to work. Good, clean bone; good full eyes; straight movers and first class in conformation; weighing from 1,800 to 2,300 pounds.

We are natives of France and buy only from reliable breeders, saving our customers a lot of money. As a rule our horses are prize winners, wherever they go, and a reliable guarantee goes with each horse sold. Come and see us or write.

JOS. ROUSSELLE & SON, Seward, Seward County, Nebraska.
25 miles west of Lincoln, 65 miles east of Grand Island.

One Black Jack; white points; 15 hands, 1 inch, Standard. Big bone; head; foot and ear. Sure and quick on both jennets and mares.

One trotting bred stallion. Standard and registered, brown, 15¾ hands; weighs 1,100; good and kind and gentle.

Two Black Jennets, and one jack colt. One of the jennets due to foal again in July.

Two pairs of heavy Percheron (grade) mares. All with foal and all extra good ones.

Ten head young mules and horses, good ones.

The above stock is all in good condition, and we will price it right as we want to sell. **Davis & Child, Richmond, Ray County, Missouri.** Forty miles east of Kansas City.

PERCHERON STALLIONS FOR SALE or EXCHANGE

One coming 5; and one coming 4, jet black; sound; weight, 1,800 lbs., at maturity. Right kind and gentle. Would exchange for cheap land or registered mares. Sickness; I must change climate, reason for selling. Your price is mine. **A. B. Like, Blue Earth, Fairfax, Linn County, Iowa.**

PERCHERONS

Some extra good young stallions and mares in foal. Plenty of bone and quality. A 2,100-lb. stallion at head of herd. Will offer some bargains in this month.

Also one good registered saddle mare in foal. **A. M. Walker, Fairview Stock Farm, Laclede, Missouri.** All this stock is registered.

Percheron and Belgian Stallians and Mares.

Imported and home-bred. Big, drafty and high classed. Our price is right. Come and look over our string of good ones. Barns one block north of C. & N. W. depot, one-fourth mile north of C., M. & St. P. depot. Mention this paper. **E. H. Kickerbocker & Son, Fairfax, Linn County, Iowa.**

TWO GREAT BARGAINS

William No. 1207, imported German Coach Stallion, black, 16¼ H., 14 yrs., 1,500 lbs.; a show horse; looks like a six-year-old. Have too many colts of his here; have to change him. A $2,200 horse for $350.00. Been here 11 years; a sure and good breeder.

Barry, a five-eighths Percheron, 18 Mo., 16 H., gray, 1,330 lbs., actual weight, in just good growing order. Will mature into a ton horse, is smooth and nice; is not lubberly; will be a great sire for mule mares. His dam is 25 years old; has had 19 living colts; extra good mule mare. Sire a ton horse. Price $250.00 if taken soon.

Also a fine roadster and extra good 4-year-old drafter, priced very low.

N. J. Robnett, Kinmundy, Marion County, Illinois.

Draft Horses in the Corn Belt

(Continued from page 6.)

to the buyers to go to the cities or to other sections of the country where there exists a scarcity of horses of this class.

It is evident that in this system of management of the horse breeding problem that horses must be produced which the market demands and there exists a constant and steady demand for good, big, sound draft horses of quality. Draft mares may very properly produce a foal each year and do the work on the ordinary farm of the corn belt. While the work is hard at some seasons of the year, yet there is much of the time on the average farm when the work is not hard. With the proper system of management mares may produce foals in the spring, be given a month or so in which to get ready to go to work and give their foals a start in life. They may then be put to work, foals kept in clean, airy stables or well fenced paddocks, and allowed to suckle three times a day and to run with the dams at night. Brood mares should not be asked to do the most difficult and dangerous work, which has to be done about the farm. Their work should be steady and particularly when heavy in foal very little backing of heavy loads or jerking should be expected of them. This class of work should rather be performed by the young horses which are approaching maturity and have not yet gone to market.

Colts produced in such a system may be broken in the fall after they are two years old and may well do ordinary farm work during the year that they are three years old. After they are four years old they can do as much work on the farm as any mature horse and yet are not quite seasoned and fleshed heavily enough to go to market, consequently they serve a valuable purpose and a good, well cared for 4-year-old gelding can take the brunt of the farm work, and the winter before they are five years old it is usually profitable to fatten them and have them ready for the buyer, who appears with the first evidences of spring.

The question of the use of pure bred mares on the farms might arise in this connection, and it may be said that at the present time only about 1 to 2 per cent of our horses are registered and in many states figures show that over half of the stallions in service are grades. This fact points conclusively toward the use of a few good pure bred mares to do the ordinary farm work. A mistake which has been made by many farmer breeders and extensive breeders as well, is to the effect that every pure bred stallion should be sold for breeding purposes. As time goes on and the demand for pure bred horses becomes greater, it will be possible and necessary to castrate the inferior individuals and not sell them for breeding purposes. When this condition arrives we will be making progress more rapidly than ever before, because the demand will be for only stallions of the best kind.

In conclusion it may be said that there is a good profit in the production of draft horses on the average farm in the corn belt. That to make this profit the greatest possible these horses should be well bred and well fed and properly marketed. Brood mares and young horses may, on the ordinary farm, do the ordinary farm work. Pure bred mares may be kept for this purpose as well as grade mares and if properly managed will yield a greater profit. Not all of the pure bred horses foaled should be marketed for breeding purposes. Only the best should go for such service and those inferior individuals which are foaled should be castrated and not allowed to reproduce themselves. The better the class of mares used. the more attention paid to the use of good stallions, the less will be the percentage of inferior horses produced. The better methods of feeding and care will be rewarded by keener demand and higher prices for the product. The great cities of our country will take the good surplus horses which the corn belt can produce for some time to come and as a safe, conservative, profitable business, the draft horse business on the average farm offers opportunities not equaled in very many other fields.

MARKET IS CALLING FOR HORSE QUALITY.

There is a striking quality requirement in the horse market. Buyers are taking the good horses freely but the plainer kinds are hard to move. This distinction was less pronounced at the first of the year and continued so until demand for plain grades was satisfied. In the past two weeks good horses sold readily notwithstanding weather conditions were unfavorable. There is always some demand for the commoner kinds, but the market is determined on the better classes or the kinds that from ruling demand have established themselves as standards. Indications are that the big firms that use horses in their business consider them a big advertisement, and at the same time have learned from experience that the best, though first cost is high, make the best returns. Several big Eastern firms are taking selected drafters in the 1,600 to 1,800-pound class, and for the right kind have paid as high as $250, and if something fancy were offered in team lots $600 would not be too high for a span. Good chunks with plenty of action and color are selling right along, and dealers report difficulty in supplying the demand. Farm mares have found a ready outlet but the recent heavy snow checked the inquiry for farm horses and mules that was just beginning. In the next few weeks this outlet is expected to broaden. A good many farmers sold short on work horses last fall owing to the scarcity of feed. Now they have to buy back the equivalent, but but are putting off the day of purchase as long as possible. A few warm days will force the demand. Heavy rains in the South cut Southern demand in the past few days, but the next few months in the cotton belt will be active in planting, and as few horses were purchased last fall a wide demand is expected to prevail this spring. In the price line plain to common horses declined $5 to $10 per head but the better kinds were steady. A good many heavy mules are wanted for construction work. In the past two weeks consignments were sent to nearly every state in the Union, more to California than elsewhere. Cotton mules and the lighter weight classes sold more slowly.

Prevailing prices for serviceably sound horses and mules, 4 to 7 years old, are as follows:

Drafters, 1,700-pound up	$165@250
Drafters, fair to good	135@165
Chunks, good	125@155
Chunks, fair	90@125
Southerners, good to choice	125@150
Southerners	70@120
Driving horses	65 up

CONFORMATION OF DRAFT HORSES.

(Continued from page 5.)

men that a horse keep its hocks well up under it all the time, has its basis in utility and not mere fancifulness.

One more condition worthy of emphasis is the effect of different sets of limbs on mode of action. The base wide animal will nearly always cut in when moving and if base wide at the breast will probably roll. The base narrow conformation usually results in throwing the foot out, and a twisted limb usually carries in the opposite direction to the twist. The reason for these modifications is that the limbs do not properly support the center of gravity and that the horse swings his leg in or out, as the case may be, in order to bring it directly under this center in the case of an emergency such as stumbling, etc.

These do not cover all the "weak links" by any means, as coupling, back, shoulder, hip, eye and wind each supply their quota, but it does cover some of the most common and it is hoped sheds a little light on the reasons for ideal conformation.

CLYDESDALES.

I have a car load of Clydesdale stallions, selected by Robert Miller, of Stouffville, Ontario, from the best herds in Canada, that I will dispose of at as low prices as possible, considering their quality and breeding, to make room for another load. **R. O. Miller, Lucas, Lucas County, Iowa, R1.**

SIX STALLIONS

Clydesdales, and a Morgan. All of breeding age and of the best breeding. All broke to harness and used on the farm. All have won prizes at county and state fairs. Those that have been tried are extra good breeders. Prices very reasonable. Correspondence solicited. **Painter Bros., Middletown, Henry County, Indiana.**

CLYDESDALES

Registered Clydesdale Horses and mares; some of them closely related to the famous "Baron of Buchlyvie," who sold in Scotland recently for $47,500. For further information apply to **John Sparrowhawk, Wakefield, Clay Co., Kan.**

GALBRAITH'S CLYDESDALES

Famous the world over for three-quarters of a century. Present stock the best we ever had. No tail ends. Every horse we have is a show horse.

More international prize winning stallions over three years old for sale in our stud than all competitors combined.

Remember the Clydesdale is the coming popular breed and has won 80 per cent of all leading prizes in competition with the best of every other draft breed at Chicago.

ALEX GALBRAITH & SON, DeKalb, DeKalb County, Illinois.

CLYDESDALES

AVONDALE STUD FARM has on hand the greatest collection of CLYDESDALE STALLIONS to be found on the Continent. The best FIVE CLYDESDALE STALLIONS at the 1911 IOWA STATE FAIR were shown by them. Visit their stables where you can see more TON CLYDESDALES than all our competitors combined. If on the market, write them for catalog, prices and terms. Address,

Leitch & Sons

Lafayette, Stark County, Illinois

SAMUDA (15368) 15165

Dark brown. Foaled April, 1908. Champpion Minnesota and Wisconsin State Fair. Considered the very best 3-year-old Clydesdale Stallion in the United States. Sire the Champion "Revelenta" by "Baron's Pride." Dam of sire by the thrice champion "Prince of Albion." Dam by the Champion Hiawatha. Grand-dam by the Champion "Prince of Wales."

Clydesdale Headquarters, McLay Bros., Janesville, Wisconsin.

At last International our horses won more first prizes than all other competitors combined. No other Western importer getting higher than a third. If you want a really good Clydesdale, can you afford not to see the best of the breed? Come or write what you want.

QUESTIONS AND ANSWERS.

(Continued from page 20.)

SORREL JACKS—What strain of blood is it in some jacks that make them get more sorrel mules than any other jack that is not near so good looking? —Missouri Subscriber.

REPLY—There are only a few sorrel jacks in existence, but there are a large number of sorrel mules produced. Color is very difficult to control in breeding. Quite frequently jacks get a large per cent of sorrel mules which have not had any sorrel ancestors for generations. When a band of mixed colored mares are bred to any sire, one may expect the mares to have their influence in coloring the colts. Color has very little to do with the market value of mules. A good, sorrel mule will usually sell for as much as any other color, everything else being equal.

POSITION OF MARE—Does it make any difference in what direction a mare stands while being bred?

REPLY—We presume your inquiry l reference to the slope of ground, and in a general way we would say that level ground should be selected. Much depends, however, on the relative size of the two animals. The mistake is often made of placing the mare on the lower part of the slope. Where the stallion is large the reverse position is best.

BREEDING IN THE FALL—I find much difficulty in getting mares in foal in the fall of the year with my stallions that are sure in the spring.—North Dakota Subscriber.

REPLY—Nearly all mares presented for breeding in the fall of the year are those which have failed to conceive in the former spring service, many of which are diseased. The mares themselves are in a better condition to get in foal as a rule in most sections in the fall of the year before the cold rains come, but stallions are not always in their best producing condition. The services are often scattering—sometimes several weeks intervening—and the spermatozoa at the first service after several days or weeks may not be active. If the stallion could make two or three services a week regularly, with plenty of exercise and other favorable conditions, a better per cent of mares could be settled in the fall of the year than could be obtained from the same mares during the spring months as they are in a more settled condition in the late summer and fall.

OBSTINATE WOUND—A year ago last summer my horse developed a severe case of scratches which gradually worked up till it affected his leg perhaps six or seven inches above his hoof. Finally with antiseptic washing and greasing it healed up. But this last spring it broke out again much worse than before. While I was away for a week maggots got into the sore around the joint. I dislodged them and treated the leg with creolin wash daily until it healed over. However, the swelling remained and a rather large lump on the side of the leg or seven inches above the hoof. Recently I applied liniment and blistered this part freely, hoping to reduce the lump. In a few days there was evidence of matter and I let it out by lancing. This continued to run a few days. Another opening appeared just above the edge of the hoof on the opposite side, it has discharged some bloody matter. Now it is all skinned over but the lump is large and leg much swollen even above the knee. Please prescribe some definite treatment. I fear serious trouble if not checked.—Montana Subscriber.

REPLY—The long continued weakened condition of your horse's limb has made it a favorable place for pus forming organisms to lodge which is the cause of the frequent abscesses. The animal should be permitted to run out, if possible, so that it may by exercise reduce the enlargement. One cannot make very satisfactory progress treating conditions of this kind unless the animal is given moderate exercise, which is best done by permitting it to run loose. The reduction of the enlargement can be hastened by daily application twice a day of soap liniment and witch hazel, equal parts. Should more abscesses develop open them and inject daily with tincture of iodine.

WASH FOR THE UTERUS—What is a good wash for the uterus in a shy breeding mare that shows nothing wrong by examination and is there any harm done by leaving the solution in the uterus?—Kansas Subscriber.

REPLY—If there is nothing wrong in the uterus no solution should be used.

THICK WIND—I have a fine 5-year-old horse that had distemper last spring and the result is he is a little thick winded. When he is worked steady he hardly shows it, but when he stands still a few days and then is worked he blows considerable. Have you a remedy?—Iowa Subscriber.

REPLY—Thick wind may be due to one of several things, but we would advise in your case that you apply a cantharides blister to your horse's throat.

Mix one pint of powdered cantharides with four parts of lard and after clipping the hair from the parts to be blistered, apply the agent with the hand, rubbing in briskly for three or four minutes. Allow the blister to extend well up in the throat latch region. In 24 hours wash off with warm water and soap and make daily applications of cottonseed oil to the blistered surface.

Internally give one dram of iodide of potash twenty minutes before feeding grain twice daily, morning and evening. This drug may be given in the drinking water or dissolved in a couple of ounces of water and given with a syringe.

EXAMINING MARES—Is it possible that a man would do any harm in getting a mare in foal by examining her if she did not need any attention? Some say it is not nature to be examining them.—Kansas Subscriber.

REPLY—Mares having colts by their sides nine days old do not need any examination as a rule, but if a mare does not have a colt it is sometimes necessary to make an examination. The finger nails should be trimmed and the hands thoroughly washed with soap and water, then rinsed in clean water with a little ground slippery elm dusted on the wet hand and arm before it is inserted into the mare. No soap or grease should ever be used. When a mare is bred, which is of a doubtful character, the condition of the cervix should be remembered. If this mare should be returned at a future date with the cervix closed, which was open at the previous breeding, the cervix should not be opened. Quite frequently mares show signs of being in heat while pregnant, and if the cervix is opened in a case of this kind, an abortion usually results. If the attendant is clean, and careful, with a reasonable amount of knowledge concerning the genital tract, there is very little danger in making these examinations.

LUXATION OF THE PATELLA—I have atwo-year-old mare, coming three, that is bothered with her stifle slipping out only in the morning, after that it does not bother her. What can I do for her?

REPLY—If you are positive that the difficulty is in the stifle, apply the following over an area about eight inches in diameter after clipping the hair from the part. Powdered cantharides, three drams. Biniodide of mercury, one dram. Lard two ounces. Mix all together and apply with the hand rubbing in briskly for four or five minutes.

Tie the animal so that it cannot get its nose to the parts for twenty-four hours at the end of which time carefully wash off with warm water and soap. When dry apply daily a little cottonseed or sweet oil to keep the parts soft. After the treatment the animal should be permitted to run out.

THIS MARE RAISED 14 COLTS.

To the American Breeder:—I have a mare that beats Mr. Rawling's mare. She is 17 years old. She had 14 colts and raised every one. She never was sick. She has been worked every year since she was two years old. JOSEPH STICKELMAIER,
Metamora, Woodford Co., Ill.

IMPORTED BELGIAN PERCHERON AND SHIRE STALLIONS AND MARES

Also a Few Very Choice Home Bred Animals.

They are from coming Two-Year-Olds up to Mature Horses.

All good solid colors.
All examined and passed as sound by the State Stallion Registration Board.
Prices as low as it is possible to buy strictly good horses from reputable sources.

SKOOG, REED & DeCOW

Holdrege, (Phelps County) Nebraska.

N.B.---We are strong on High Class Belgians.

IMPORTED ROYAL BELGIAN

DRAFT STALLIONS AND MARES

These together with our pure-bred, home-grown horses, make up a choice collection to select from. Look at our winnings at American Royal, 1911: First in two-year-old class; first in class of three: second in aged class showing three horses.

Also good young jacks ready for service

Come to our barns before buying. Stock priced to sell. Write us; your letter answered the day it is received. Breeding barns in town on 2 railroads.

BLUE VALLEY STOCK FARM, W. H. Bayless, Proprietor
Blue Mound, Linn County, Kansas

IRVINEDALE FARM BELGIANS

We have some very high-class stallions and mares that we will price very reasonable to buyers who will visit us within the next month, (as we wish to reduce our number). Among these are a number that were winners at the various shows last year. Come to the farm and we will fill your wants. **Winnings above might be used to advantage.**
CHAS. IRVINE. - - - - Ankeny, Polk county, Iowa.

Royal Belgians

Imported and home-bred stallions and mares; first and second prize winners at Hutchison State Fair; from the best known strains; for sale at "live and let live" prices. Every horse guaranteed as represented. For particulars, write, or better, come and see. David Cooper & Sons, Freeport, Harper County, Kansas.

IMPORTED BELGIAN STALLION.
My coming 2-year-old Belgian stallion, **imported in dam,** 2d prize winner in National Belgian Breeders' Futurities. Color chestnut, weight 1,600 lbs. If you want a good one write for price, or better come and see him. **C. W. McDermott, Wiota, Cass Co., Ia.**

BELGIANS

Stallions and mares, over 100 head, Jan. 1, 1912. 24th year in business. Write for catalog. **Henry Lefebure, Fairfax, Linn County, Iowa;** 8 miles west of Cedar Rapids.

IMPORTED BELGIAN STALLION

Dark bay; weight, 1,900, sound and sure; 13 years old. Am going out of the business. Price, $600 cash, at my barn. **S. J. Rector, Sodus, Berrien County, Michigan.**

If a neighbor has a better beast than yours, give him the credit due—but to buy or breed a better one in turn, is up to you.

MOLD POISONING FROM ENSILAGE ALSO.

To the American Breeder:—Iowa farmers have suffered heavy losses in the past few months by the death of horses from a disease that affects these animals almost exclusively. It is usually fatal; it is not contagious, and it is quite certain that it comes from the eating of moldy fodder or grain. There is only one safeguard against it and that is the rejection of any feed that shows signs of mold. Ensilage and corn fodder of any kind and hay from swampy lands need to be inspected with special care, for they are the most likely to be moldy. Cattle often seem to eat spoiled plant food without harm, but to horses it is poisonous.

This disease has been called by various names: Forage poisoning, cryptogamic poisoning, enzootic cerebritis, epizootic cerebro-spinal meningitis, leuco-encephalitis, etc.

It usually appears in isolated outbreaks and generally the horses on a single farm in a community are affected. In some cases where horses are not fed alike, only those given a certain kind of feed are taken sick. In these facts there is quite conclusive evidence that the disease is associated with the food eaten and that it is not transmitted from one animal to another. The outbreaks appear more frequently in low, swampy districts because conditions there are more favorable for the development of the molds and the undesirable changes in plant foods believed to be responsible for the disease. It is not by any means confined to these districts, however, nor is it limited to any certain food stuff. It merely occurs more frequently in some foods than others, due to their nature and method of storing.

There are several molds which grow on food materials under certain conditions which are more or less injurious. The most common are the black mold, the blue mold and the green mold. They are found most frequently in ensilage, corn, hay, oats and ground feeds. Moisture favors their development on all food stuffs.

Ensilage is one of the most important and valuable foods available to the Iowa farmer, but it is often responsible for forage poisoning. Sweet ensilage is of proved worth as a feed for horses as well as for cattle, but speaking generally ensilage feeding is attended by some dangers that the owners of silos should know. Ensilage contains the necessary moisture and, in most cases, the required heat, to favor the development molds. On this account it is more often a cause of forage poisoning than other food stuffs. Perhaps 80 to 90 per cent of the outbreaks reported to this station come from feeding moldy ensilage. The quantity of mold may be so small as to be overlooked and yet be dangerous. Especially is that true of hay coming from low, marshy ground; though the mold in it may not be seen at first glance, there may be enough of it to produce poisoning and death.

Moldy corn has been responsible for several outbreaks of forage poisoning. Ears that have been attacked by the corn ear worms are particularly liable to be moldy.—C. H. Strange, Veterinary Department, Iowa State College, Ames, Ia.

BRACE FOR YOUNG COLTS.

To the American Breeder: I will describe to you a brace for mule colts that are weak in the ankle joints commonly called "knuckling." Anyone that raises mules has a case once in a while, and they all know what usually happens to the mule when they bind it or try to splint it. I have used it on several and never lost a case. This is a home product but it does the work and don't leave any scars.

Have a plate made that resembles a shoe that will fit the hoof, have three nail holes in it, one in front and one at each side, if you can't put it on successfully with nails use wire by making a small hole in the hoof, weld a bar on at the front side (round bar) long enough to come up just below the knee joint, turn an eye in it at the top to put a piece of canvas or some stout cloth to hold the joint straight. With a fair trial this will sure do the work. It should be left on for two or three days or perhaps longer, as the case may be.—Willey Clouston, Jr., Ness county, Kansas.

RETURNING MARES.

All mares should be returned for retrial on the twenty-first day after being bred. If a mare refuses on the twenty-first day she should be tried once a week for three weeks. Some breeders re-try on the eighteenth day, but if a mare is in heat on the eighteenth day she is nearly always in heat on the twenty-first day also. Mares are more liable to settle near the end of the heat period, and for this reason it is better to have the mares returned on the twenty-first day. The average heat period in mares is from four to nine days. The shorter the heat period the more liable they are to fertilize.

One service is usually all any mare should have during one heat period. It is a waste of time for both the mare owner and the stalion or jack owner to re-try mares on the ninth day, as many do. The twenty-first day is the proper and earliest time that mares should be re-tried, after being bred.

Mares should not be severely teased at the three, six or nine weeks' retrial after being bred. The fetus is not securely attached for about ten weeks after fertilization has taken place. Many mares lose their colts from being teased too much. The breeder ought to remember how the mare acted at the time of service, and if she does not show to be equally in as good heat as at the previous service, tie her to a hitch rack near the stallion for half an hour and see what the results are.

RANK STALLION.

To the American Breeder: On page 20 of the issue for February 5 I note an inquiry as to what to do for a rank stallion. I had a similar experience with a stallion last season, and would say that if your inquirer will cut the grain ration in half he will find the horse will serve properly within a day or two. As soon as the stallion regains his normal behavior he may gradually increase the feed until he gets his usual feed, and if the stallion again gets too rank repeat as before. My horse had been used only lightly for teasing.—Lewis B. Tietze, Laclede county, Missouri.

TO STUDY SERUMS IN EUROPE.

A leave of absence for a part of next summer has been granted Dr. F. S. Schoenleber, professor of veterinary medicine at the Kansas Agricultural College, by the board of regents. Doctor Schoenleber will go to Europe on an inspection tour of serum plants. He will spend most of his time in Germany, where more progress in the use of serums has been made than in any other country.

Serums for the prevention of blackleg in cattle, fistula in horses, and cholera in hogs, now are made and sent out by the agricultural college. Doctor Schoenleber hopes to find serums which may be valuable in combating other diseases common to Kansas live stock. He will visit the Royal Veterinary College at Hanover, Germany, which is considered one of the best in Europe. He probably will be gone six weeks.—Kansas Industrialist.

PERCHERON AND BELGIAN STALLIONS AND MARES.

Our horses are all good clean sound fellows, with plenty of bone. Our ton horses weigh 2000 pounds.

All Stallions have been passed on by the Stallion Registration Board of Nebraska, and all pedigrees have been passed by the Department of Agriculture at Washington, D. C.

We have five mares that average 2100 lbs. One team that weighs 4440 and all of them are sound.

Come to our barns and see some of the best horses in the United States.

FRANK S. WEST & SON
THE SQUARE DEAL HORSEMAN
Wood River, Neb., and Hamilton City, Cal.

RHEA BROS. PERCHERONS

We exhibited fourteen Percherons at the late Nebraska State Fair and won 17 prizes, as follows: One silver medal, one championship, seven firsts, two seconds, three thirds and three fourths. Now, remember that we showed our home bred horses in the same classes with the imported stallions and won First every time, bar one. So much for the show. The important thing to be considered is "how does the whole lot show up?" and that is exactly where we are strong. Our two-year-olds, some of them still in the pasture, weigh from 1,600 pounds to 1,900 pounds. These weights guaranteed.

We always claimed to have the big boned kind, and this season we are sure we have better bone than ever, cleaner joints and better feet.

Don't lose sight of how we raise these colts, in the pastures winter and summer, until coming three-year-olds. That's why they are hardy and prove breeders from the start.

Our horses are acclimated, its importance cannot be over estimated. We have stallions coming two, three, four and a few older ones for sale at prices that are very reasonable. Every stallion sold under a full guarantee; can furnish life insurance for two-thirds value at cost.

Write for pictures, descriptions, prices and any information you may want.

Arlington is on the main line of the C. & N. W.R.R.
28 miles northwest of Omaha, 8 miles east of Fremont and 55 miles north of Lincoln.
Twelve passenger trains daily.

Arlington, Nebr.

My November Importation Percherons, Shires, Belgians

Are in fine shape. I have 2-year-olds weighing a ton; 3-year-olds and over, 1900 to 2300 lbs.; sound and right in every way, and suit the most critical buyers. Every horse is guaranteed as represented. A veterinarian's certificate and state license is furnished with every horse. Pedigrees are right. Send 10c for picture of horse parade.

Wm. Crownover, Hudson, Blackhawk County, Iowa.

Percheron, Belgian, Shire, Hackney Stallions and Mares

Two to four years old, imported and American bred. Choice colors, lots of bone, weighing on maturing 1,800 to 2,300 pounds.

Three importations last few months, others to follow soon.

Prices below competition. I sell them low and they go fast.

Lew W. Cochran, Crawfordsville, Montgomery County, Indiana.
Office, 109½ S. Washington Street.

IMPORTED PERCHERONS AND BELGIAN STALLIONS AND MARES
PERSONALLY SELECTED WITH CARE

Good, big, rugged kind. Also home bred stallions. All bought so they can be sold. One importation Oct. 10th. Last importation Jan. 18th. If interested write or see me. Horses are kept at the track.

Bell Phone 237 R or Union Hotel **J. R. JUSTICE** *At Union Hotel GALESBURG, ILL.*

Kindly mention the AmericanBreeder when writing to our advertisers.

PERCHERONS, STANDARD AND JACKS.

Two Percheron stallions, black, 5 and 6 years old; 1,950 and 2,200. Sound and registered. Hobson took first in the open class with 5 importers in the ring, and 1st in the American bred class at the Nebraska State Fair, 1909. He is a heavy boned, square framed horse and weighs 2,200 lbs. Tricon is 6 years old. Was my choice out of a herd of 200 head of the best stallions I ever saw together. Also Bud Mason 42689, standard and registered, by Penrose 4912. Bud scores 98, or 2 points less than perfect. Will sell or trade for saddle stallion. Also 4 jacks from 15 to 15¾ hands, Standard; as good as grow. All registered and fine performers. All of this fine stock is for sale, as I have just turned into my 72d year and can't handle them and will close them out right. **Wm. H. Patterson, Mound City, Holt County, Mo.**

RIVERSIDE STOCK FARM.

A fine bunch of large registered Percheron stallion colts, coming 2 and 3 years old. 3-year-olds weigh 1,600 to 1,850 lbs. 2-year-olds, 1,450 to 1,550 lbs. The large boned kind. Three standard bred stallions all registered from 15¾ to 16 hands high. One black Shetland pony stud 6 years old. A fine breeder. All stock guaranteed as breeders.

A few large Mammoth black jacks.

Two carloads of mules from 3 to 4 years old, from 15 to 15 hands high. **O. L. Thisler & Sons, Chapman, Dickinson Co., Kan.** On main line U. P. R. R.

BARGAINS IN BREEDING STOCK.

One registered dapple gray Percheron stallion, 10 years old. Good breeder and sound. Has weighed over a ton. Price $500.

One registered, chestnut sorrel, Standard bred stallion, 16 hands high. Weighs 1,250 lbs. One of the best bred and best individuals in Eastern Kansas. No mark but plenty of speed. 9 years old. Price, $500.

One registered black Tennessee Jack, 6 years old, 14½ hands, Standard. Good performer and foal getter. Price, $450. If needing anything, come and see this stock. **Chas. A. Galt, Mound City, Linn County, Kansas.**

PERCHERON STALLION.

Pierre 55078, for sale; registered in Percheron Society of America. Black-gray; star; weight, 1,800; heavy boned; heavy bodied; well proportioned. Coming 4 in May. State's certificate and certificate of soundness. Price, $650.00.

Also Champion 70919, gray, star, 2 years old in June. Heavy boned; will make over a ton horse. From a ton mare and a 2,200 lb. sire. Price, $400. **G. H. Blum, Cedar Falls, Blackhawk County, Iowa.**

BLACK PERCHERON STUD COLTS.

From imported sires and dams, the big boned, blocky kind; you rchoice of three for only $350. For particulars address, Clarence G. Welsz, Palmyra, Marion County, Missouri.

IMPORTANT CHANGE IN QUARANTINE RULE.

To the American Breeder: Recently in shipping an imported stallion to Wisconsin he was held up in Chicago for the mallein test and would not be allowed to be moved until the railroad received a certificate of the mallein test. Now, if the railroad was in the wrong in doing this, please let me know, and if I have not a case of damage against them.—Indiana Subscriber.

REPLY—On Oct. 16, 1911, at the recommendation of the then acting state veterinarian, the Wisconsin board adopted a ruling which is designated as Rule 5 (printed below) and was in operation until Feb. 19, 1912, when it was withdrawn at my recommendation, as it necessarily imposed a hardship on a number of people unnecessarily. We adopted in its place a rule requiring all horses coming into the state to be accompanied by a health certificate, one paper to be filed with the shipping bill, one to be sent to this office and another to be retained by the owner. Failure to comply with this might result in the quarantine of the animal until released by the board or state veterinarian. Copies of these rulings will be distributed as soon as possible.—O. H. Eliason, State Veterinarian, Madison, Wis.

Rule No. 5, referred to above and which was repealed February 19, was as follows:

All horses shipped into the state must be accompanied by a certificate of health showing that they have been tested with the mallein test and found to be free from glanders; said test to be applied by a graduate of some licensed veterinary college in the United States, Canada or Europe; the certificate to be certified to by the state veterinarian, or sanitary commission of the state in which the test is made, or by the veterinarian employed by the United States Department of Agriculture. Certificates of such inspection to be made in triplicate, one copy to be handed to the owner, one copy to be given to the transportation company transporting the animals, and one to be immediately forwarded to the secretary of the Wisconsin Live Stock Sanitary Board, at Madison, Wisconsin, or in lieu of such mallein test, animals may be shipped to their first destination in the state of Wisconsin, there to remain in quarantine until they may be mallein tested by some one designated by this department, such test to be at the expense of the owner.

BREEDING DISEASED MARES.

It is not the best plan to take chances on insulting a mare owner by telling him off hand that his mare is diseased. Many of them are not familiar with the need of guarding against diseased mares, as their fathers and possibly their grandfathers had every mare served whenever she came in season. It is better for the breeder to show the mare owner the condition of these mares. Then use a microscope and let the mare owner see that the stallion is discharging live spermatozoa. Explain to him that if the mare was in proper condition she would be fertilized at the first service.

The first thing breeders think of in connection with serving diseased mares is to wash the penis with some antiseptic after serving such mares. This is usually not a success. There is a little hole in the end of the penis where germs accumulate while the penis is expanded. On the penis also there will be wrinkles after it retracts. If the attendant could wash the penis with warm water and soap before the discharge quits coming one might expect some results. Many cases of gonorrhoea and syphilis ahve been contracted after the parts had been washed with an antiseptic. Anyone doubting this statement might consult a graduate physician or veterinarian. The only sure remedy in this case is to not allow the stallion or jack to serve a diseased mare.

No grease, soap or antiseptic of any kind should be used on the penis as a rule. A better method is to use bran, thoroughly soaked in warm water. Insert handful after handful into sheath and work it around in such a way that all the parts will come in contact with this bran. It is not necessary to wash the bran out as it will come out later, leaving the sheath and penis in a clean, healthy condition, without any irritation. This should be done about every two weeks. But using bran will not destroy germs.

THE "DOUBLE COVER."

Frequently mare owners demand a "double cover," which has no value whatever. When a stallion or jack makes a discharge containing live spermatozoa, there are thousands and thousands of live spermatozoa which look like "wiggle tails" when viewed by a high power microscope. Any one of these coming in contact with an ova in a natural condition will fertilize it, and that is all that can be done. If there are two eggs liberated another one may be fertilized. The remainder of the spermatozoa are useless.

One drop of the semen will contain so many spermatozoa that it is nearly impossible to count them. If there are so many spermatozoa at the discharge of a stallion, and it only requires one to cause fertilization, what would be the object in making a double cover? None whatever.

The writer well remembers when a mare was bred to his stallion, and the mare was presented nine days later in heat. The mare owner demanded a double cover from the jack, which was given, but in the following spring the mare delivered a horse colt, to the surprise of the mare owner.

There are entirely too many of these cases to be profitable. As a rule there is very little use of giving a mare more than one service during a heat period. Occasionally a mare is fertilized that is bred every day through the entire heat period, but this is not evidence that the numerous services were of any advantage, as any one of the services might have been just as effective. The mare was probably in better condition for breeding than she had been at former services.

Lessening the number of services by a stallion or jack during the crowded breeding season, is an advantage to every one concerned. The time will probably come when good stallions and jacks will only make two or three services during the week, and breed all the mares with the capsule system. If a stallion only makes three services a week he ordinarily will discharge enough semen to breed over twenty mares. Sixty mares a week should be considered a good business for a stallion or jack.

SCRUB STALLIONS AND JACKS.

Most every breeder in the country can call to memory a time when he was standing a stallion or jack which had little value. There is something peculiar about the horse breeding business. Once a man gets a little experience along that line he is not liable to quit. There are also locations where valuable animals do not seem to be profitable.

The greatest difficulty with owners of inferior stock is that they do not pay much attention to horse breeding. They usually have other lines of business which they are more familiar with. These men do not realize the danger of conveying disease germs from one mare to another through the act of copulation. This is detrimental to the business of others as well as themselves. We hope that these men will study breeding more closely in order to eliminate this great danger.

Those who own more valuable breeding stock realize the need of making each service count, and that

EXCELLENT PERCHERONS

From 1 to 3 years old. Stallions sired by G. L. Carlson's Nicholas. I have 2-year-olds that weigh over 2,000 lbs. and yearlings over 1700 lbs.; also a number of good registered mares. I have 30 of the best stallions that can be found today in the West. These are two, three and four-year-olds, and I am pricing them where they will sell. Write, or come and see me. M. L. Ayers, Shenandoah, Page Co., Iowa.

REGISTERED FRENCH DRAFT STALLION.

Coming 3 years old; weight 1825 lbs. First prize Big Fair of Kansas, 1910 and 1911. Certificate of soundness and pure breeding by state board. An extra good one. George Groenmiller & Son, Pomona, Franklin County, Kansas.

they cannot afford to breed diseased mares, and then breed several other mares, and put some of them out of breeding condition. Inferior breeding stock is not very profitable, either for the owners or for the patrons. If men owning such would get a few of their friends interested with them, a good sire could be purchased. It would make more money for them, and their customers also. We want these men to read the article in this issue on stallion organizations. There is a wonderful field for practical horse breeders.

FARM WORK AND BROOD MARE DEMAND.

The usual spring condition of high priced horses in the country (as compared with city markets) is now upon us. While in some parts of the country there is an excess of young light weight horses, unfit for satisfactory farm work, there is no other excess apparent. On the other hand, the demand for horse stock of any sort that is reasonably sound, and has weight enough to work satisfactorily at the plow, shows the usual briskness for this season, while the demand for mares good enough to raise good drafters is remarkably strong. Almost every class of horse is now higher in the country than in the city markets, the one exception, perhaps, being the heavy drafters of the very best quality. There has been for some time a good wide margin of profit in the production of good horses, and this has made us the steady and well maintained demand for choice mares which is now a feature, and which is exerting a stiffening influence on the market, both in season and out.

THE JACK PIT.

Occasionally a jack is spoiled for serving by the mare not being properly fastened in the pit. The bar at the side of the mare should be fastened so it can be pushed in toward the mare and a large bolt stuck through that bar into another plank to keep the mare in the proper position. A substantial bar should be placed in front of the mare so the mare can be kept close to the end of the pit. Frequently when a jack dismounts he is liable to get a leg behind the mare in the pit. The corners in the pit should be closed up by three-cornered planks securely fastened, so there will be no opportunity for the jack to get caught in this arrangement. The pit is best made by the side of a wall, where the halter rope of the mare can be run through a ring so as to hold here head up, as otherwise she might become frightened and try to get out, but if her head is held up she does not have a very good opportunity. Some mares are frightened at the sight of a jack. Those mares should be slightly teased with a jack or made familiar with them before the service. The pit should be so arranged that the jack could be raised or lowered. A few shovelfuls of dirt thrown in for tall mares and removed for small mares is an advantage. It is better that the ordinary jack be a few inches too low than too high. Most of them have a long penis and it is best not to have too much of this inserted, as it pushes the neck of the womb out of line, and the discharge is not made in the uterus. The pit should be made substantial so that there will be no injury to the jack in case of an accident. Good jacks are scarce, and it is not profitable to take any chances of injuring or getting the jack frightened through carelessness.

MISSOURI DRAFT HORSE OFFICERS.

The new officers for the Missouri Draft Horse Breeders' Association are: President, J. F. Roelofson, Maryville, Mo.; vice-president, Chas. Holland, Springfield, Mo.; secretary-treasurer, E. A. Trowbridge, Columbia, Mo.

EXTRA GOOD PERCHERONS.

Jack Sores; How to Treat

Keeping Out the Flies and Giving the Right Kind of Feed Among the Preventives. The Curative Care and Treatment. When to Call a Veterinarian.

This is one of the constant problems in keeping jacks, and a preventive is much easier than a cure. The preventive is to keep the jack's tail screened. A jack sore usually starts from a break in the skin, and it is infected by flies. The flies continue to work on it until the jack usually manages to scratch it or gnaw it until a large sore is the result. A jack should have a yard where he could run out at night, and be screened in his stall in the day time, and his legs should be rubbed daily with the hand to see that there are no small irritated places on the legs. If a few hairs seem to be stuck together they should be separated and cleaned immediately. Don't let a sore get started anywhere on the legs, as it often results in a very serious condition.

Many breeders think that corn is the cause of these sores, as it creates too much heat. Corn is not a very good feed for a jack if he will eat oats. Most of them will eat oats. Occasionally it will be necessary to soak the oats from one day to the next, with a little bran and a little salt in it. The vessel that the feed is soaked in should be a galvanized vessel, and should be thoroughly washed and set out in the sun occasionally, or a small quantity of feed may be left in the vessel for several days which may sour and cause trouble in the digestive tract. A part alfalfa or part clover with the balance prairie hay or clover and timothy in equal parts is very good feed. If the bowels become constipated a teaspoon full of glauber saults may be fed once a day. The quantity of this may be regulated to get the desired results. All jacks should have an abundance of water kept where they can drink at any time. The same vessel should be used to drink out of each time, as many jacks will not drink out of a strange vessel for several days.

Most of these jack sores will heal during the fall and winter months, so that only a scar remains in the spring, but this scar is an excellent place for the flies to work, and most jacks are not good at keeping the flies from their legs unless they can bite them off, and while biting them off they usually irritate the sore with their teeth which makes the condition worse.

Every breeder should have a lot of green limbs close to his jack lot, and occasionally throw in handfuls of these limbs. A jack will skin the bark off of these limbs very clean, and there seems to be something in their nature which requires this kind of feed. It is an excellent appetizer and probably has some benefit in purifying the blood. Cherry tree limbs are said to be the best.

Knock out all the nails and smooth all the rough places in teh jack's stall. They might start an irritation of some kind. Keep plenty of bedding in the stall where the jack can lie down without causing any irritation from hard lumps on the floor. Trim off all the sharp points of the jack pit which he might come in contact with. If the skin is broken the chances are that it will not heal rapidly on a jack during the spring and summer months while flies are prevalent. A great many serious jack sores have been cured by putting them in a basement where it is dark and cool, and where there are no flies. This brings similar conditions to the fall and winter months when the flies are out of commission.

If a sore has started the first thing necessary is to put on a hot bran poultice, covering the sore, and keep it well soaked with warm water for ten hours. Then take the poultice off and wash the parts with warm water and castile soap, then rinse in warm water and apply burnt alum, rubbing it in well. In thirty-six hours apply another hot bran poultice and keep it on for ten hours. These poultices should be put on with a bandage similar to those used by race horse men in bandaging legs. Wash the sore out again with warm water and castile soap and rinse it off with clean water, then dry it with a soft, clean, cloth that will not cause any irritation and then take lime, sulphur and tannin in three equal parts and rub it in thoroughly all over the sore. About three times a day dust iodoform over these part to keep the flies away, and it may keep the jack from gnawing it, but if he does gnaw it, keep his head tied so he can not reach it. Have a boy ride this jack, with a good pair of spurs one mile the first day, and increase the distance one mile a day until he is exercising five miles a day until he shows a good thrifty condition, and a reasonable amount of exercise is not injurious at any time. If the sores do not heal within ten days apply another flax seed poultice for ten hours, then put on burnt alum, as there probably has remained more or less proud flesh which the first application did not remove. Then repeat the above treatment.

Do not wash jack sores more than once every two weeks, as the treatment should be more of a drying nature in order to effect a cure. The iodoform should be kept in a can similar to a pepper box so that it can be dusted on the sore quickly and without waste, as it is expensive. The flies must be kept away from the jack in order for the treatment to have any value. If the sore is of long standing and resembles a wart or a growth, the quickest way to cure it is to have it operated on and removed. A qualified veterinarian can do this without much difficulty, but do not remove any of the good tissue if possible to avoid it. The difficulty with these sores is that there is too much dead tissue and the skin can not entirely cover the open space. The best time to operate on jacks is in the fall, as that gives them the fall and winter months to heal up in.

On N. Wilson, Kittanning, Pennsylvania, has 100 Percheron stallions and mares. Mr. Wilson's last importation was June, 1911. He will arrange terms to suit the purchaser. Write to him.

50 REGISTERED JACKS AND JENNETS.

Every One a Black Mammoth,

2 to 7 years old, 14½ to 16 hands high. I bought every jack I have from the biggest breeders in Kentucky, and I handle only the big kind—the big bone, the big body kind. Come and see me.

¶ A few Mammoth jacks and jennets. Also a ton imported black Percheron stallion, 7 years old. All stock guaranteed.

G. H. MINTON,

Forest City, Holt County, Missouri.

Fairview Jack and Jennet Farm

A fine assortment of the best Mammoth jacks and jennets that grow 14½ to 16½ hands high, jacks with lots of bone and substance. Everything guaranteed as represented. Prices right. Address

J. C. Huckstep, Eolia, Pike Co., Mo.

RAISING JACKS.

It is not profitable as a rule to keep a large herd of jennets together, as abortion seems to be more prevalent when they are closely associated. If one jennet loses a foal in a herd it is usually easy to find more of them within a few days. There is probably no other female that loses her offspring as easily as the jennet.

After the jennet is bred she should be taken away from all jacks, mules and other jennets and put in a pasture with dehorned cattle where she can be quiet. The best rule, in fact, would be to breed them with capsules, so that they would not get extensively worked up. No other female shows the intense heat that a jennet does. If she was quietly bred with a capsule and taken away immediately better results would follow. Probably this is the secret of the great success breeders are having with the capsule system. When they are used it should be at the close of the heat period, or better still, about two days after the close of the heat period.

Jennets should have free access to all the salt they want at all times. If they are kept away from salt for several days or weeks they are liable to consume enough salt to cause abortion. A jennet usually carries her foal a little longer than a mare, but the same jennet may be very irregular in this respect. The foal may come a few days before the regular period or a few days or weeks afterward. In breeding jennets back after they have colts (they may not come in heat at the ninth day, in fact many of them do not show good heat until the fifteenth day) it is not necessary to try them extensively as a rule, for if they can see a jack or a mule they will show it themselves if they are in good heat.

Jennets especially should foal in a clean place, and they should be watched closely at foaling time, as many of them do not break the sack the colt is foaled in and the colt smothers. Many of them will select a manure pile to foal in, which may cause the colt to have naval infection. See the answers to navel ill in the veterinary department of this issue.

SLOW JACKS.

It is jacks that have been associated with mules and jennets during their early life to the extent that they have become infatuated with their long eared relatives that it is usually most difficult to get to make prompt service, unless they are able to cast their optics on animals of their kind.

Some breeders have had good success by keeping a blanket on a jennet in order to retain the scent, then putting the blanket on the mare, and letting the jack serve the mare with the blanket on. Others are using urine from a jennet. Have the urine corked up tight in a vessel so that it will not lose its flavor. Put a little on the tail of the mare if the jack smells there, or pour a little on the ground if the jack smells on the ground. Others have a stall by the jack pit where a jennet is kept.

Some jacks require a jennet to be in heat. This kind is very difficult to handle. Breeders have success in putting a blanket on a jennet which is kept near the jack, then remove the jennet and put the blanket on a mare, and eventually take the jennet away. The jennet should not be removed, however, until the weather gets warm and numerous services have been made, as jacks serve more promptly after the weather gets warm.

The attendant will do well to have a little sugar around the place, and when he visits the jack give him a little bit of sugar occasionally, or if the jack chews tobacco give him a little tobacco occasionally. Jacks are also very fond of carrots, which are very good for them. Several carrots a day will help to restore confidence as well as increase the appetite for other feed. Everyone handling jacks should make it a point to have the confidence of the animal at all times. Whips or harsh words have no place in jack breeding as a rule. There are jacks, however, which are not of a timid nature, and they might be severe. These jacks should be watched as they are dangerous when they take the notion to be, but this kind is not usually slow.

About the first thing that most breeders do when the jack refuses to serve is to feed them a lot of drugs. Many valuable jacks have been absolutely ruined by being fed drugs such as are sold for slow jacks. They are not only injurious to all breeding stock, but seldom make a jack serve and are a waste of time and money.

BUYING A NEW JACK.

Several readers have had difficulty with jacks. When a jack is purchased one should find out just how he has been handled in every respect if possible. Some jacks will make a prompt service for anyone under any conditions, but many of them have been educated to perform a certain way, and if they are used after this plan they will usually work much better than if a new system is adopted. Some jacks serve well in a pit, some are taught to walk around in a circle before they get ready, while others are led up behind the mare and allowed to get ready in that position.

Occasionally a jack is found that will not get ready unless a certain individual or animal is within his view. A Missouri breeder has a jack that will not make a service unless someone is there dressed in a woman's uniform. A Texas breeder has a jack that will not get ready unless a cow is in sight. These things may seem strange, but it is the way the jacks have been raised. The Texas man's jack had been raised in a corral with a cow, while the Missouri breeder's jack had been raised by a lady.

Quite frequently when a new jack is introduced and he does not make a prompt service, the new owner is greatly discouraged. Some jacks require considerable time to get reconciled to their new surroundings. The average jack needs much kind treatment when introduced to his new home. Everything is strange to him, and many of them are of a timid nature. Another thing necessary in the introduction of a new jack is to find out what his rations have been and continue it, as a change of feed frequently upsets their appetite and they may not do well for a while. If their appetite should fail them a few handfulls of green stuff will frequently restore the appetite, but this should be fed sparingly until they are accustomed to it.

USING JACKS AS TEASERS.

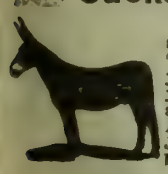
It is not a success to use jacks as teasers as a rule. Some of them tease very nicely without making them slow, but most of them get slower every year they have been used as teasers. It is much better to have a stallion do his teasing, as mares will frequently show signs of heat for a stallion when they are afraid of a jack.

THE JACK'S FEET.

The condition of the jack's feet may have something to do with jack sores, and they should be kept in good condition. Many of the average jacks will be taken out of a dark dungeon with the first days of spring and expected to make two services a day the entire breeding season without any preparation whatever. Many of them have crooked feet; some of them have thrush, others have very hard, dry feet. They should be attended to. If the feet are too hard to trim, soak them. A woman can make sacks on a sewing machine in a few minutes. Put the sacks on the jack's feet and fill them with bran, then keep them on the feet for twenty-four or thirty-six hours, soaking with warm water. After this the feet may be trimmed to a normal condition. Clean out the bottom of the feet good all around the frogs, and tamp all the crevices in the bottom of the foot with salt frequently. Don't put any grease or oil on the foot at any time

AL. E. SMITH'S Stock Farm

Seventy-five registered Black Mammoth Jacks and Jennets, 15 to 16 hands standard, imported and home bred. Some good Percheron Stallions. More good big boned, high class jacks and jennets than you will find in any one barn. Forty miles west of Kansas City, Al. E. Smith, Lawrence, Douglas county, Kas. R. 1.



DEER PARK BREEDING STABLE.

12 good jacks from 1 to 7 years old, black, well bred, and large. 20 jennets, good, and most of them in foal. 6 stallions, 2 registered saddlers, 2 registered trotters, 2 registered draft, one Percheron, one Shire. These horses are for sale or exchange for other stallions or horse or mule stock. This is the home of Missouri Wonder, champion jack of America. Been shown 22 times and won 22 blue ribbons. Come or write to **Sappington & Brockman, Centralia, Boone Co., Mo.**

CALLAWAY COUNTY PAGE AVENUE JACK FARM.

Callaway Jacks are the best. The best is always the cheapest. Jacks are for sale at all times. None better. Also one registered saddle stallion, 16 hands high, dark bay, fine style and goes all the gaits thoroughly, and as a producer has proven himself second to none. Will sell worth the money if sold soon. **J. R. Reynolds & Son, Guthrie, Callaway County, Missouri.**

Jacks For Sale

26 fine large Tennessee jacks; 6 months to 7 years old. Also 24 jennets bred to fine jacks. Prices right. Catalog free if you mention American Breeder. **S. W. Jetton & Co., Murfreesboro, Tenn.**

KENTUCKY AND MISSOURI BRED JACKS.

They are of the best blood and extra heavy boned. The best I ever owned in 25 years in the jack business. So come and see. Some are good ones.

J. E. Park, Cameron, Clinton Co., Mo.

HOME OF THE GIANTS.

75 head of jacks and jennets. Won nearly half the ribbons at Sedalia in 1911. We think we have the finest herd of jacks and jennets in Missouri. We have these prize winners for sale. We handle the big black, big boned, big footed kind. **Bradley Bros., Warrensburg, Johnson County, Missouri.** 65 miles East of Kansas City, main line Missouri Pacific. Right in town.

JACKS AND MULES

300 head of Colorado raised Jacks, Jennets, Mules and Brood Mares. All guaranteed. Prices right. **Lewis Swink & Son, Rocky Ford, Otero County, Colorado.**

A NUMBER ONE JACK.

Six years old; black, mealy nose. Acclimated to the north and guaranteed in every way. Weight about 1,000 lbs. **Lars Bartelson, Badger, Holt County, Nebraska.**

Two Registered Jacks

Coming 2 and 3 years old. Good ones of my own raising. Cheaper than dealers or large breeders will sell.

J. W. Stormont, Dighton, Lane Co., Ks.

JACKS AND JENNETS FOR SALE

I have 25 head of jacks on hand and 40 jennets that I can sell cheaper now than in the spring. If you want to make more money on your feed than you ever did before, and have stock used to its new home when the breeding season begins, come and see what I have. **Philip Walker, Moline, Elk Co., Kansas.**

POLK COUNTY JACK FARM

30 head of jacks and jennets; good as lives. Choice of 40 years' breeding. I have a fine lot of coming 3 and 4-year-old jacks; broke to serve. All black with white points. All the bone and body you are looking for; 14½ to 15½ hands; price low. **R. M. Johnson, Bolivar, Polk County, Missouri. R. 6.**

FAIRVIEW STOCK FARM

25 Mammoth jacks from weanlings to 8 years; largest breeding herd in the West. Herd headed by the great Pharoah 2491, Champion of Tennessee in 1910.

H. T. Hineman, Dighton, Lane Co., Kansas.

BLACK JACK WITH WHITE POINTS

Fifty-seven inches from center of wethers to hair of hoof; 30 inch ears; 63 inch girth; 8 inch bone. Will be four years old next June. Has never been used but was raised with mares and will be no trouble to handle. Price $300. **E. Joy, Golden City, Barton County, Missouri.**

MAMMOTH JACKS and JENNETS

25 big black mammoth jacks and jennets. The breed that sired the World's Fair premium mules and the Grand Champion Jack of the Illinois State Fair for the past two years. All stock fully guaranteed. Prices very reasonable. **James M. Spurgeon, Williamstown, Lewis County, Missouri.**

REPUBLIC COUNTY JACK FARM

Six good jacks for sale, including two that are extra good. Will pay car fare if they are not.

T. E. Collins & Son, Belleville, Republic Co., Kansas.

THE KENTUCKY JACK FARM

Established 1884

BREEDER of registered, Mammoth Kentucky jacks and jennets; big bone; plenty of weight. Forty head of 3 and 4-year-old jacks; also young stock for sale. Would be pleased to have you visit my farm for inspection or write for prices. I guarantee to please you. **Joe E. Wright, Junction City, Boyle County, Kentucky.**

JACKS AND SADDLE STALLIONS.

100 Registered Kentucky Mammoth Jacks and Saddle Stallions. A big lot of jennets, saddle mares and geldings. A few good walking horses, pacing and trotting stallions. Also Big Black pigs, Tamworth and Hampshire swine. Cook pays the freight on jacks. **J. F. Cook & Company, Lexington, Fayette County, Ky.**

CLOVERDALE FARM

Breeders of jacks and Percheron horses. 20 three and four-year-old jacks; 15 yearlings.

Some nice Percheron stallions, mares and colts; also Tamworth Swine. All stock registered or subject to register.

Would be glad to have you visit our farm or write for circulars. **H. T. Brown & Co., Lexington, Fayette County, Kentucky.**

THE
AMERICAN BREEDER

A Journal of Live Stock Improvement and Modern Breeding Practices

Volume V. *Kansas City, Missouri, March 20, 1912* *Number 5*

ILLUSTRATING THE VALUE OF GOOD SIRES.

The illustration shows two geldings out of the same mare. The smaller gelding is five years old and the larger one, four. They were raised by the same man under about the same kind of treatment. The smaller gelding was sired by a very nice little mongrel stallion, and the larger one was sired by a good, average, registered, draft stallion. These horses are half brothers, the difference being practically all due to the difference in sires. They sold at public auction on the same date in the Kansas City horse market, the smaller gelding bringing $112.00 and the larger one $238.00. The breeder who raised these horses saved $7.00 in the service fee for the little gelding, but he made $126.00 by using a better sire the following year. The smaller gelding should have brought a little more, but the market is apt to be crowded with small, inferior stuff, while the demand is increasing for the larger and better ones.

Graham Publishing Company, Inc., 225 West Twelfth St., Kansas City, Missouri

TAYLOR & JONES
STALLIONS

Stallion buyers, why do Taylor & Jones sell more horses than almost any of their competitors? If you will stop to think, you will certainly know their horses must be better, their prices lower and their guarantee as good as can be written, as every man wants the best value for his money. We can please any customer in either Percherons, Shires or Belgians.

Our first importation in 1912 has just arrived at our barns and in the lot are many high class stallions, and as there has been no great expense on them as yet in the way of feed, care, risk, etc., we can sell them worth the money. If you are looking for a good horse, come and see us.

Taylor & Jones,

Williamsville, Sangamon County, Illinois

VOLUME 5 KANSAS CITY, MO., MARCH 20, 1912 NUMBER 5

Spring Cautions for Colt Care

Attention Needed by the Newly Dropped Foal. The Most Frequent Trouble as the Colt Approaches Maturity, and How to Handle It.

Written for The American Breeder,
By Dr. L. L. Lewis, of the Oklahoma A. & M. College.

ANY foal should be closely observed for a few hours after it is dropped to see if all of the body functions are normal. Ordinarily the navel needs no attention. The most common trouble is constipation and the first milk from the dam is Nature's remedy against this trouble. If for any reason the bowls are not moved by the milk, then a half ounce of castor oil should be administered. Give this out of a spoon and not from a drenching bottle. A rectal injection may be used, consisting of tepid water with a small amount of soap. Use a small hand syringe or a fountain syringe. If the navel is wet and the cord does not appear to be drying up as it should, then if necessary tie with a clean cord and wash with a warm solution of creolin or carbolic acid, three per cent. If there should be dripping of urine from the navel, then it would be the safer plan to secure expert advice.

The accompanying figure gives a fair idea of the structures involved in the cord at the navel. Before birth all of the blood to be purified must pass out to the membranes that line the womb and after purification the blood is returned through the navel. Two blood vessels pass out (the umbilical arteries) and one returns, (the umbilical vein). The other vessel, through which urine passes out, is called the urachus. This vessel, which leads from the bladder, should close at birth. If it does not, then the navel will remain wet for some time, and there is often a chain of serious consequences following an infection through the navel.

Colt Distemper.

There is scarcely any horseman or farmer who is not perfectly familiar with distemper, a very common disease of young horses. This disease is very common in most stock regions during the spring months and may be known by a number of names, the most common ones being colt ill, strangles, distemper, and occasionally by the name of epizootic. Horses between the ages of two and five years are most susceptible, although the trouble may be seen occasionally in older horses. Mules and asses are much less likely to have the disease and they are very largely affected. Other farm animals are not subject to the disease, although there is a certain resemblance between colt distemper and distemper as seen in young dogs.

There are a variety of conditions that may favor the development of strangles or distemper in the horse. Sudden changes of temperature or chilling of the body may bring on this trouble during the spring while the colt is shedding the winter coat. Exposing the colts to the cold storms of early spring often brings on attacks of the disease.

It is a well understood fact among horsemen that strangles is easily spread among young horses. One colt in the barn will soon involve a number of the susceptible horses. A period of from four to eight days intervenes between the time colts are exposed before they show the actual disease. Since the cause of distemper is a germ or bacterium that will live for some time outside of the body, one can easily understand why public feed yards, livery stables and the public watering trough are especially dangerous for young stock that have not had the disease. One can generally trace an outbreak of distemper to some incident where some of the horses were exposed to the disease, either directly or indirectly.

It is mainly through the respiratory system that the germ enters the body and causes an intense inflammation of the membranes of the air passages. The trouble generally extends to the glands in the region of the head. Generally one recognizes the disease by the enlarged and swollen condition of the glands under the jaw and in the region of the neck. This glandular swelling is often severe and may require careful handling. The suppurating glands are often in the body cavity. This may explain the difficulty in managing some of the cases of distemper.

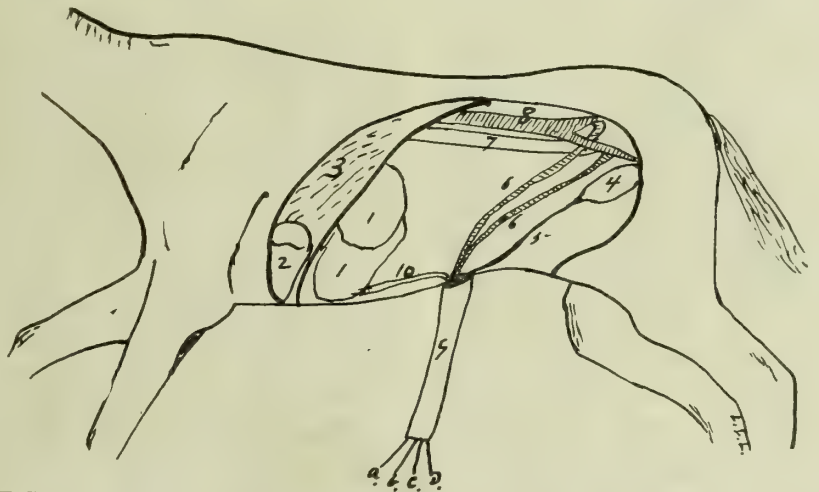

FIGURE SHOWING SOME BODY ORGANS AND THE VESSELS OF THE UMBILICUS.

1, Liver; 2, Heart; 3, Lung; 4, Bladder; 5, Urachus; 6, Umbilical Arteries; 7, Posterior Vena Cava; 8, Abdominal Aorta; 9, Navel Cord; 10, Umbilical Vein; a, b, c, and d, the Four Vessels of the Cord.

The attack of distemper may be brief and mild in mature horses, but in colts the disease usually runs a regular course, requiring from two to three weeks for recovery. The symptoms may be quite severe if the glands become swollen and suppurate. These swellings should be lanced as soon as a soft place can be detected in them, or where they begin to point as though "coming to a head." The gland under the jaw may be lanced with a knife and without much risk of striking a large vessel or nerve, but if the glands in the region of the throat latch are to be opened the skin should first be cut through; then use some rounded blunt instrument until the pus sac is reached. Occasionally, abcesses may appear on various parts of the body. This indicates a general infection or what is commonly called blood poison.

Treatment is generally unnecessary so far as drugs are concerned. Give the colts good shelter, keep them out of storms, especially cold rains, and give only a moderate amount of feed that is easily digested and that will keep the bowels open. Horses should not be worked during an attack of distemper and colts should never be castrated while they show any effect of the disease. Sometimes the inflammation in the head may be much relieved by steaming with vapor of hot water containing oil of tar, creolin or carbolic acid. Distemper is a disease that usually runs a definite course, and good care of the colts is worth more than medicine.

STERILITY OR BARRENNESS.

Written for The American Breeder, by Dr. O. O. Wolf, Franklin County, Kansas.

The breeder of improved live stock can well afford to give consideration to the question of sterility or barrenness. Often we find that what should be the most valuable animal in the herd proves to be a non-breeder. Again we find the number of calves or foals produced to be so small, in comparison to the number of cows or mares maintained in the herd, as to greatly reduce the profit. It is difficult to ascertain to what an extent sterility exists, but from an extended experience and observation I am led to believe that not to exceed sixty or seventy per cent of mares and cows bred are producers.

Sterility may depend upon organic or physical causes, and may amount to permanent impotence, more particularly when congenital (dating from birth), and located in the generative apparatus. Monstrosities, free-martins, hermaphrodites, animals in which one or more important organs of the sexual apparatus are absent and hybrids are generally permanently sterile. There are, however, exceptions to this rule, as there are several well-authenticated instances recorded in which the female mule has bred, as well as other hybrids.

Prolonged postponement of breeding after reaching a breeding age will often result in sterility. Change of climate has in some instances a marked influence on fecundity, sometimes putting it altogether in abeyance, and at others rendering the animals infecund for only a longer or shorter period. It may also be impaired or suspended by abuse of the generative functions, bad hygiene and similar causes.

It may be due temporarily to premature or tardy coition, when the generative organs are not in a physiological condition for conception, or when they are in an irritable, abnormal state. Under fed or over fed animals generally do not breed so readily as those which are in moderate condition; fat animals are especially unfruitful, due in some instances to a fatty degeneration of the ovary; in others to a filling up of the Fallopian tubes with fat, and in other instances to an acid reaction of the contents of the uterus. The normal reaction should be neutral or slightly alkaline. This latter condition may be overcome by the injection of a slightly alkaline solution a short time before breeding.

Very nervous or excitable animals are less likely to procreate than those of an equable and gentle disposition. Artificial impregnation will often accomplish the desired result in animals of this kind.

Various diseased conditions of the generative or other organs, as well as general derangements, may also prove antagonistic to fecundity. Prominent among these should be mentioned a retained after-birth and abortion. In the latter instance conception will often actually take place and the embryo be expelled as the next or some subsequent period of estrum (heat) would naturally appear. Isolation and some good uterine tonic, such as black haw, will often carry them over periods of this kind.

Occlusion of the canal or opening leading to the uterus has been known as a cause of sterility for years. This occlusion may be complete during coition and prove fatal to conception; it may be due merely to a spasmodic condition of the muscles of the cervix. The oiled hand should be introduced into the vagina to ascertain the state of the part, when, if the closure is suspected to be owing to muscular defect, the impregnator or capsule may be employed to advantage.

In many instances we have a rigid, impervious os, due to hypertrophy from plastic exudate and the formation of false membranes; this usually occurs after the first birth. In many instances this condition can be remedied in a safe and simple manner. The animal is secured and the oiled hand, in the form of a cone, passed up the vagina to the cervix in a half-rotary or screwing manner; on reaching this the tips of the fingers are to be insinuated, by the same movement, into the os, and pushed on until the cavity of the uterus is reached, if possible. In the cow the os is often so rigid that it will be impossible to insert the finger and it will be of advantage to

use a sound, one about the size of the forefinger is of the right size. It may be made of wood, scraped down to a smooth surface and well oiled. Various instruments have been devised to dilate the cervix, but nothing is superior to the finger or the sound. The animal may be put to the male on the same or following day. This simple operation for the cure of sterility has been often practiced, and in the majority of cases with success.

In rare instances dilation may require to be effected by a cutting instrument, but this should never be resorted to until the simpler and safer method has failed.

Other conditions must be treated according to indications.

STALLIONS AS TEASERS.

There are stallions which are used as teasers without any serious detriment, but there are many which we believe should never be used extensively as teasers. Those stallions which are very keen and also get a severe erection, burn a lot of energy and in many cases are injured from a foal producing standpoint. Those stallions will usually make enough noise that it will not be necessary to lead the mares up to a teasing pole. If they can get within a reasonable distance of a mare, a close observer can usually tell whether a mare is in season or not without allowing the stallion to get his nose on the mare. A stallion which does not get an erection easily may be used as a teaser in most cases without much or any injury to himself. A stallion which is used as a business or saddle horse extensively and that is accustomed to being around horses and mares at all times, can often be used as a teaser without much danger.

Many young stallions are ruined for life by being used too much for teasing. A young horse can be broken to tease occasionally, but he should have a service, as a rule, soon after teasing mares, as otherwise, he is liable to learn to be a masturbater, a habit from which only a few horses ever recover.

Those having one or more valuable stallions which are doing considerable service should have a regular teaser. The teaser should be a business horse of some kind, so that he can be used extensively in regular work. Some breeders have a road horse, others are using a five gaited saddle horse. The teaser can usually make enough money on the side to pay for his keep.

THINKS STALLIONS KEPT TOO FAT.

To the American Breeder: Please find inclosed postoffice order for $8. My first ad has brought me many correspondents. Many thanks.

I have always admired your paper and could hardly do without it. I wish there was some way of reaching the mare owners, as they need an education along this line.*

A great deal has been said about care and feed of stallions. I have visited many stallion barns and the way I see the business most of the stallion owners have their stallions too fat; 11 to 11½-inch bone and carrying 1,900 to 2,000 pounds of meat during the winter time. They go to bring them out of the barn; they commence "Ho, boy, be careful!" You keep that surplus off them and they come out like a steam engine, and you can hardly hold them on the ground. I have a German coach 18 years old. Now will weigh 1,350, after the season he will weigh 1,500 pounds. He looks like a work horse and acts like a 4-year-old. Can show more colts for the same number of covers than any horse in our country. We bred as high as 107 mares during one season. —Robnett & Lacy, Fayette county, Illinois.

*The best plan we can suggest is to get the mare owners to subscribe for the American Breeder.—Editor.

QUESTIONS AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, makin git safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

OBSCURE LAMENESS—I have a mare coming five years old, that gets lame in her left hind leg. She has been lame twice. I was driving her on the road for a day and the next morning she was so lame she could bear no weight on that foot at all. In a day or so she was all right again. In fact, she limps every morning for a few steps. When she limps she only puts the toe of her foot on the ground, and when she rests she stands resting her foot on the toe. I am unable to locate the lameness. Her fetlock seems to be enlarged some. I can find no tender spot. I have felt for ring bones and spavin but cannot find anything. I shod her with neverslips, but it did not help her any. I worked her yesterday to get a small load of wood, and she was all right, and this morning she was lame. When she does not limp you can always tell she favors that foot a little. Colorado Subscriber.

REPLY—The location of lameness in animals, especially horses, is usually more difficult than its successful treatment when found. Your description makes us suspicious that the trouble is in the hock, and is perhaps due to a forming bone spavin. A bone spavin may be very small or even not observable to the eye and yet cause very severe lameness. A very good way to test for lameness in this part is to stand the animal on level ground and take up the affected limb and flex it up as high as possible, holding it in this position at least two minutes. Suddenly release the limb and start the animal off promptly at a brisk trot. This test will usually greatly aggravate the lameness due to bone spavin for a few steps and when shown is considered quite diagnostic of the disease. Inasmuch as the successful treatment of bone spavin usually necessitates the intelligent use of the firing iron we would suggest that you have her examined by a good veterinarian.

CHRONIC RHEUMATISM — Please give me treatment for chronic rheumatism in a jack.—Illinois Subscriber.

REPLY—There is no fixed or definite rule for treating chronic rheumatism in any animal, for the reason that what will help one case will have no effect on another case. To begin with you must first give heed to the housing of your jack. His quarters must be dry, well lighted and well ventilated with an opportunity for exercise in a protected paddock, when the weather is suitable. Unless this is given attention you can expect but little good to come from the use of medicine.

Give forty grains of iodide of potash dissolved in a little water by means of a syringe three times a day, thirty minutes before feeding grain for a week. At the end of this time discontinue this agent and give a half ounce of salicylate of soda with one dram of nitrate of potash in his feed if he will eat it, and if not it will have to be dissolved in a little water and given by means of the syringe. By alternating these two preparations week about you ought to see some improvement in the course of time, provided your diagnosis is correct.

OBSTINATE WOUND—I have a jack that has a sore on his foot that I would like to know what to do for him. About two years ago he hurt his foot on the door sill just at the upper part of the hoof and a bony substance started to grow on the hoof, but since it is growing up toward the ankle and is raw and sore and is half way up and has assumed a cancerous nature. The jack is a valuable animal and I would appreciate any suggestion you can make on the subject. And what is the best means of ridding him of lice, and rubbing.—Misouri Subscriber.

REPLY—It is very likely that the wound has become badly infected through the jack rubbing the part. At least wounds of this kind are inclined to itch, and if the jack can get at them he is very much inclined to make matters worse by rubbing. It will be necessary for you to give careful attention to the general health of the jack, care as to his stall, noting that it is kept cleaned daily. Wounds of the limbs will not do well if there are irritating gases arising from decaying manure.

To get rid of the lice make use of the kerosene emulsion as directed under another inquiry in these columns. We suspect that the wound is raised above the surrounding skin surface, and should be cauterized. Have your druggist stir a little commercial sulphuric acid in a half ounce of sulphur, so as to make a paste, and by means of a thin wooden paddle apply a very thin coating of this paste to the raw surface. Do not allow it to contact the skin for the preparation is a caustic. This should shrink the raw surface and cause a scab to form which should be permitted to remain. During this treatment the jack must be tied in a manner so he cannot molest the wound with his nose. The wound must be protected from being annoyed by him during the healing process also. This can perhaps be done best by putting on a surcingle and tying a side stick to it and to the head stall.

In a couple of days begin to apply a solution of sugar of lead using an ounce of the lead to a pint of rain water. Wet the wound at least three times a day with this solution. Feed laxative food and give the jack ample exercise.

STRING HALT—I nave a jack that has stringhalt. What can I do for it? Will it disappear with warm weather? Two years ago I had a mare become quite badly stringhalted in real cold weather but it went away as warm weather came on and has not returned. I have had two other cases of mares becoming slightly stringhalted in bitter cold weather, but they got over it very soon with no return. Yet I have heard that it was incurable. A veterinary surgeon once told me that he could cure it by cutting the affected cord.

REPLY—String halt is usually worse during cold weather but you are fortunate in having it disappear entirely in certain animals. This is rather unusual, as they are not ordinarily inclined to recover readily.

Many cases have been improved as well as cured by an operation and if your animal does not get all right with the return of warm weather it will be necessary to submit him to operation if you desire him relived of the trouble.

ARTICULAR RHEUMATISM—Will you please tell me, through the columns of the American Breeder, what will cure my horse? Symptoms are: Swelling at the joints, stiffness, giving down when pinched on the loins. Urine is not colored. Sheath swells just before he gets over his spell. The spell comes on him every fall and winter, and lasts from four to six weeks. I gave him sweet spirits of nitre to move his kidneys.—Kentucky Subscriber

REPLY—You should be very careful that your horse is housed in a warm dry barn, properly lighted and ventilated. Give him nutritious, laxative diet so as to keep his excretory organs active. Give him two drams of powdered colchicum and two drams of nitrate of potash three times a day in his feed. Continue this treatment for two or three weeks.

SALT FOR MARES—Would salt cause a mare to lose her colt when it only lacked about six weeks of being her foaling time? This mare had not had any salt for some time.—Indiana Subscriber.

REPLY—It would be possible for a mare to eat enough salt to cause an abortion at any period of gestation. All horses should have salt where they can get it any time.

JACK SORE—I have a jack which I kept in an implement place of about one-half acre where they kept plows, etc., but he had good exercise as we kept everything out of the way as far as possible, but one day I found a scratch on his hind leg, just in front of his hock joint. I suppose he skinned it on a plow. I paid very little attention to it at first, but when it did not heal, I tried several remedies recommended by horse doctors, without success. The sore is now about one inch long and one-half inch wide. Every morning it runs blood, and in the day time dries up. It has been this way for over a year.—Kansas Subscriber.

REPLY—We are sending you the last issue, (March 5) which has a jack sore treatment on page 30.

WHITE HORSES—Will you kindly tell me, through your valuable paper, where the white, pink skinned horse originated (some call them Arabic). Are there any full bloods registered as such? If not how is the registry started? I am a breeder of them. Have white sire and dams. They are used for white hearse horses here in Ohio. I sell them for good prices. They weigh from 1200 to 1300 pounds, and are beautifully built horses.—Ohio Subscriber.

REPLY—We do not know where white horses originated, but they probably started from freaks. They are not necessarily Arabians. White horses with pink skins are not often found among Arabians. We do not believe that you will be able to find enough white horses with pink skins to start a very large registry association. If there are any other breeders raising white horses, we would be glad to have them write us, to see if an association could be formed to register white horses with pink skins.

KANSAS STALLION LAW—I have a grade horse, that I keep for my own use, and do not want to stand him for public use, nor have I ever asked a person to use him, but they come from quite a distance to breed to him as he is quite a colt producer. In that case, do I have to have him inspected?—Kansas Subscriber.

REPLY—If you stand your stallion for public service and collect a fee, he must be licensed.

WILD MARE CHUTE—I want to build a chute for breeding wild mares with capsules, and hope to see a cut in the American Breeder before long.—Oklahoma Subscriber.

REPLY—Can some of our readers give a plan for breeding wild mares in a chute?

DON'T COME IN HEAT—I purchased a Percheron imported filly at two years old, soon after she landed in this country in the summer of 1910, and during the season of 1911, she was tried once each week, but failed to come in heat. I had the stallioner open her, but that failed to bring results. Can anything be done to bring her in heat, or would you consider her valueless so far as breeding is concerned? She is a very large mare and has been in fine health ever since I bought her. What would you advise in the matter?—Illinois Subscriber.

REPLY—Breed her with a capsule when the weather gets warm whether she is in heat or not.

BREEDING BAGS—Is the use of a mare breeding bag injurious to the stallion in any way?—S. Dakota Subscriber.

REPLY—There are no mare breeding bags on the market that have proven a success. A stallion may serve in one for a while, but there is danger of injuring a stallion or jack any time. Don't use any breeding bags at any time.

TRANSFERRING STALLION LICENSE—If A sells a stallion to B and at the time of this deal they have a misunderstanding, and A delivers license with the stallion he sells to B, but refuses to transfer license by signing it over to B. What can B do to get this stallion license renewed? This is a registered horse.—Illinois Subscriber.

REPLY—Write to Mr. Dickerson, Secretary Stallion Registration Board, Springfield, Illinois.

HYMEN—I have a jennet three years old last October, that never has been in heat that I can tell. I thought she was once, and took her to a jack, and the man thought he would open her up, and found that she was partly grown up. Would it be safe to let a jack serve her or should I have her cut open? She is

very large and grows fast.—Missouri Subscriber.

REPLY. If you refer to a partition between the vulva and cervix any one can open that without any danger. Most young females have this but it is more pronounced in some cases than in others. If this is the difficulty it will be safe to let the jack serve her.

WARBLES—Two nice grade Shorthorn heifers that I bought last fall from a man who sold us this farm earlier in the season have lumps all over their back. The people here call them "warbles," and say I can squeeze them out. There are no veterinarians near so I write to know what these things are and if squeezing them out will be a safe treatment. We moved from the north down here last spring, and this is the first I ever heard of warbles.—Missouri Subscriber.

REPLY—Warbles are quite annoying to stock in your section, and they may be gotten rid of temporarily by the method you mention. There is no known preventive treatment that is of practical value.

RUSSIAN THISTLES—Some papers this winter printed a good deal about the Russian thistle being good for cattle feed. Twenty years ago I traveled in Western Nebraska and heard some of the same kind of talk about a weed they called the tumble weed. I figured that people were just talking this way as a sort of an excuse for not keeping their farms free from weeds. Since that time a great deal of alfalfa has come to be grown in the West, and I am surprised to hear this talk renewed about feeding cattle on weeds. I should like to know if the Russian thistle and the tumble weed are not the same thing, and if there is really any excuse in using them for cattle feed where alfalfa, kaffir corn and other cultivated feeds are grown?

REPLY—While the Russian thistle and the ordinary tumbling weed resemble each other to quite an extent, yet they are not the same. They are both tumbling weeds, however, that is, will roll over the ground before the wind, but one if of little consequence in interfering with farming operations, while the other is a noxious pest. It is stated by those that have converted Russian thistles into hay that it makes most excellent forage for both cattle and sheep. We do not favor encouraging the growth of the pest, however, for this purpose, for the reason that it spreads its seed rapidly on account of its tumbling propensities when ripe.

LUMPY JAW—I have a cow which our veterinarian tells me has the genuine lump jaw, and I guess that is the case. Her jaw is not only swelled but the bone seems thick and the swelling has broken underneath the jaw. The veterinary tells me the disease is contagious and that I should keep her away from the other cattle. I have her shut up now, but she has been with the herd for several months since the swelling began. I should like to know more about this disease and what to do for it?—Arkansas Subscriber.

REPLY—It is quite likely your veterinarian is correct in his diagnosis of your case. The presence of lumpy jaw is dependent upon a low form of fungus for its existence, which substance grows upon vegetable matter, usually the grasses. When these low forms of vegetable life are taken into the mouth they may be brought into contact with a wounded surface and thus be given the opportunity to find their way into the tissues, resulting in an infection known by the popular term of lumpy jaw. Not all swellings about the jaw are due to invasion of this kind, but the great majority are. Lumpy jaw may be stated to be more or less contagious for the reason that if an animal having an open wound due to the disease, is permitted to run with the remainder of the herd, the pus will be discharged more or less on the feed and the other animals consuming the same are liable to become infected. It is poor practice to permit any infected animal to run with the herd, especially one with a discharging wound. If lumpy jaw is not amenable to treatment by surgical means, which usually applies to involvement of the soft tissues only, the best practice is to send them to market at an early date and abide by the decision of the federal inspector as to whether or not the carcass is fit for food.

Government Record Control

Bill Introduced by Congressman Carlin Would Give Department of Agriculture Authority Over Herd, Stud and Flock Books in the United States. The Bill in Full.

A bill authorizing the secrtary of agriculture to publish (or to supervise the publication of) herd, stud and flock books for the registration of cattle, hogs, horses, asses, sheep and goats in this country, has been introduced in Congress by Representative Carlin.

The bill, as introduced, is as follows:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Secretary of Agriculture be, and he is hereby, authorized to publish annually a list of herd, stud, and flock books of horses, asses, cattle, sheep, swine, and goats published in the United States by associations or corporations as being recognized by him as reliable, such recognition to be given after formal request by such associations or corporations, which after due examination by agents of the Secretary of Agriculture are found entitled to such recognition under the provisions of this Act.

In applying for recognition, a list of the officers, directors, members, or shareholders, with amount of stock held by each; a statement of total capitalization, capital stock paid in, and amount remaining in the treasury; and all records, books, papers, accounts, and similar material to be submitted to the Secretary of Agriculture or his agent, same to be sworn to by president or secretary, attested by three directors. The number of directors of such an association or corporation shall be at least five.

No such book will be recognized unless it maintains in suitable form a record showing alphabetically the names of animals registered; a numerical index of these names, if numbers are assigned the animals registered; the sex, color, and markings, if any; the date of birth, the names of the sire and of the dam; the name and address of the breeder; a record of the produce of females; and a record of transfers of ownership of animals from one person to another, showing name and address of each person to whom they are transferred and date of such transfer.

Sec. 2. That the Secretary of Agriculture shall require that each recognized herd, stud, or flock book contain rules:

First, permitting registration of an animal as pure bred when it is (a) by a sire registered in said book and out of a dam registered in the same book; (b) by a sire registered in a book certified for the same breed by the Secretary of Agriculture under the provisions of paragraph four hundred and ninety-two of the tariff Act of August fifth, nineteen hundred and nine, and dam registered in said book, and (c) animals whose pedigrees show five or more successive top crosses of pure-bred sires in direct male line of the same breed registered in the same book. This rule shall be voluntary, and may be adopted or not, as the association or corporation sees fit, subject to the approval of the Secretary of Agriculture.

Second. No person to be denied registration of an animal bred by him, provided such animal is pure bred under the rules of the association or corporation to which application is made, the application for registration is made out in due form, the prescribed fee accompanies the application, and provided said person has not been expelled from any recognized association or corporation for falsifying pedigrees.

Third. Application for registration to be made on oath before a duly authorized notary public or other public officer, authorized to receive affidavits and depositions.

No association or corporation shall be recognized unless it has published a volume of its herd, stud, or flock book within four years of date of application, and no such book shall be retained on the recognized list unless a volume is published at least as often as once in four years. The Secretary of Agriculture may require publication oftener than this if such step seems desirable.

After recognition the Secretary of Agriculture may make such examinations of books, records, papers, files, and accounts of recognized associations or corporations used in the conduct of recording pedigrees as he may deem necessary at such times as he may require, by day or night.

If affairs of a recognized association or corporation engaged in the business of recording pedigrees are, in the opinion of the Secretary of Agriculture, not being properly conducted, or forty per centum of the members or shareholders of such association or corporation request it, the Secretary of Agriculture may send an agent to take charge of the affairs of such association or corporation and run them until they can be left in the hands of proper persons.

If any person in making application to a recognized association or corporation for the registration of any animal or animals shall, acting himself or through an employee, make fraudulent affidavit to the breeding of said animal or animals, with the intention of obtaining thereby a certificate or certificates of registration as a pure-bred animal or animals from a herd, stud, or flock book association or corporation recognized by the Secretary of Agriculture, when such animal or animals are not entitled to such registration, such person shall be guilty of a misdemeanor, and may be punished by a fine of not less than one hundred dollars nor more than one thousand dollars, or by imprisonment for not less than three months nor more than one year, or by both fine and imprisonment, and the recognized herd, stud, or flock book association or corporation to which such fraudulent application was made shall refuse to register further animals bred or owned by such person, and, if he be a member or shareholder of such association or corporation, shall expel him from membership. No person who has been expelled from a recognized association or corporation for this offense shall be permitted to hold membership or stock in any other recognized association or corporation or register animals therein. Failure to comply with the law in this respect shall cause such association or corporation to be refused further recognition by the Secretary of Agriculture, or the Secretary of Agriculture may appoint an agent to take charge of the affairs of such association or corporation and run them until they can be left in the hands of proper persons.

Each recognized association or corporation shall forward to the Secretary of Agriculture on January fifteenth of each year a report showing the number of animals of each sex registered during the preceding calendar year, showing the imported animals separately from those which were bred in the United States; a list of the officers, directors, and members or stockholders of the association or corporation, and amount of stock held by each, a statement of total capitalization, capital stock paid for, and amount of stock remaining in the treasury; and such other data as may be required by the Secretary of Agriculture. This report shall be verified under oath by the secretary of such association or corporation and attested by three directors. If this report is not received by the Secretary of Agriculture by February first, the said Secretary of Agriculture shall at once send notice to that effect to such delinquent association or corporation. If the said report is not then received by March first, the Secretary of Agriculture may withdraw the recognition of such association or corporation, or he may appoint an agent to take charge of the affairs of such association or corporation and run them until they can be left in the hands of proper persons. Together with the list of recognized associations or corporations, these reports shall be published annually by the Secretary of Agriculture.

No recognized herd, stud, or flock book association or corporation shall change, amend, or revise its rules of entry, raise or lower its fees for the registration or transfer of animals, or increase its capital stock, or change, amend, or revise those parts of its constitution, by-laws, or other rules affecting said rules of entry, registration and transfer fees, or the rights of individuals to register animals, without first obtaining the approval of the Secretary of Agriculture.

Sec. 3. That the Secretary of Agriculture shall assign a serial number to each herd, stud, and flock book association or corporation recognized under the provisions of this Act, and this serial number shall appear in the following form on all pedigree certificates, applications for registration, transfer certificates, letter heads, or other printed forms uesd by such association or corporation in the conduct of its business, and in advertisements of such association or corporation in periodicals, thus:

"Recognized by the Secretary of Agriculture ..... Serial number.....
(Date) (Number)"

Sec. 4. That the Secretary of Agriculture shall make such regulations as are necessary to carry out the provisions of this Act, and shall as soon as practicable require uniform systems of keeping and publishing pedigree records of herd, stud, and flock book associations or corporations which are recognized by him under the provisions of this Act.

No animal shall be exported from the United States as a pure-bred animal for breeding purposes unless it is registered in a herd, stud or flock book recognized by the Secretary of Agriculture, and clearance papers shall not be issued for such animal or animals until certificate to that effect has been furnished by said Secretary or his agent and presented to customs officers.

Sec. 5. That to carry out the purposes of this Act, there shall be appropriated for salaries, clerical assistance, traveling expenses, and other miscellaneous expenses, including rent, the sum of thirty-five thousand dollars; and the expenses of the certification of pedigrees of animals imported into the United States for breeding purposes, under the provisions of the tariff laws, shall be paid for from this appropriation.

CAPSULE BREEDING IN MISSOURI.

To the American Breeder: Mr. William Plummer & Sons of Hale, Mo., brought to my place an unbroken 3-year-old filly. She came a distance of fifty miles. I capsuled her and they took her home the same day, making a distance of forty miles. The result was a nice horse colt that went out to the colt shows and county fairs and won $48 in cash prizes this last fall.

Mr. J. C. Allamong of Hale, Mo., brought me a big black mare a distance of twenty-two miles with a nine-day colt. I examined the mare and found the vagina with considerable urine in it. I took a soft, sterilized cloth, carefully wiped the urine out, capsuled the mare and the result was a nice mare colt.

Mr. David Owens brought me a mare in 1909 that had the neck of the womb badly torn. I did my best to try to settle this mare with natural service and failed. He brought her back in 1910 and I bred ner with a capsule and got a nice mare colt. He brought her back in 1911 and I used another capsule and she is is in foal again.

Mr. George Jones brought me a 5-year-old mare in 1910 that I had tried all through the breeding season for two seasons and could never find her in heat, and he brought her several times during the season of 1910 before he would let me use the capsule. I bred her with a capsule when showing no signs of heat and got good results.

Mr. R. V. McGuire brought me a mare 22 years old, and when he came I had the barn full with nine mares. I told him I didn't know whether I could breed his mare that day or not. I bred all the mares in the barn and when I got done I had some semen left. I went out of the barn and capsuled his mare and got a nice horse colt. He sent her back in 1911 and used another capsule and she is in foal again.

Mr. Dick Strhelow brought me a mare, and when he came my barn was full with nine mares. I told him I didn't think I could breed his mare that day, and he tied her to the fence and came in the barn, and I went ahead and bred the nine mares in the barn, and had some semen left and went out and capsuled the mare tied to the fence and got a nice mare colt.

Mr. Mike Cusick of Spring Hill brought me a mare that he had bred all season up to June 17 to another man's horse with natural service. At that time he came wanting me to examine her. I told him we would try a capsule. Just one capsule brought a nice mare colt.

If it wasn't for the capsule system I wouldn't have the nerve to by such a high priced horse the editor of the American Breeder saw me buy at the International this winter.—J. W. Everson, Livingstone county, Mo.

We are sending explorers to the ends of the earth for new plants—and getting them.—From the 1911 report of the United States Secretary of Agriculture.

THE AMERICAN BREEDER

With which is combined
THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE Editors.

Published semi-monthly (on the 5th and 20th of each month) by the
GRAHAM PUBLISHING COMPANY, INCORPORATED.
225 WEST TWELFTH STREET.
Kansas City, Mo.
BELL TELEPHONE, 4297 GRAND.

All communications for this paper should be addressed to the American Breeder, or the Graham Publishing Company, and not to individuals.

Advertising space for a single issue, $2.80 for an inch or less. For larger space or longer time, rates furnished on application.

Subscription Rates.

To all points in the United States and Mexico, per annum, 50c; 3 years, $1, payable in advance.

To all points in Canada, per annum, in advance, 75c.

To all foreign points (in the International Postal Union), per annum, in advance (6 francs, 5 shillings), or $1.15.

When sending subscriptions, please state whether they are renewals or new ones. Always renew under the same name and initials as previously used, and at least two weeks before your present subscription expires, so that you will not miss any number. When changing your postoffice address, state the old address as well as the new one.

Watch the wrappers on your paper. The month before your subscription expires they are stamped "your subscription expires with next issue," and on the following edition is stamped "your subscription expires with this issue." When the time for which the AMERICAN BREEDER is ordered has expired, it is always discontinued.

If you miss your paper please notify us at once and all lost copies will be replaced.

Entered as second class matter, November 23, 1911, at the postoffice at Kansas City, Mo., under the act of March 3, 1879.

Copyright, 1912, by the Graham Publishing Co.

All persons are warned not to reprint any part of this paper during 1912, without giving full credit for the same to the American Breeder, Kansas City, Mo.

"RECOGNIZED LIVE STOCK RECORDS."

In response to a number of inquiries concerning a bill offered in Congress to regulate the registration of pure bred live stock, we are taking space in this issue to give the provisions of the bill that has been introduced. In order to do this we are omitting our regular feature on the subject of recognized live stock associations, which was begun in our issue of March 5, with sketch of the history of the American Association of Importers and Breeders of Belgian Horses, and extracts from the constitution and by-laws of the association, giving the information necessary for an understanding of its methods, and for the detection of any fraudulent pedigree or certificate of registration which might be offered.

In our next issue we will, of course, continue this feature as previously announced.

COUNTY BREEDERS ASSOCIATION.

Horse breeders should be interested in organizations. This, however, should not be limited to horse breeders. All interested in live stock should be invited and solicited. Much can be done for the improvement of live stock in these organizations if the horse breeders will become interested with the breeders of other live stock. At the meetings the program can be arranged so that those interested in special subjects can attend, at just such as the discussion will interest them. If all the breeders are united the associations will be larger in scope, and attract a larger attendance. Several hundred breeders can be assembled in the average county. Each one of these individuals can bring a few farmers with him. The breeders need this education. It will give them opportunity to employ men who can deliver valuable lectures on special breeding subjects. In addition to the education afforded the American breeders, it will interest the American farmers and promote the improvement of live stock wonderfully.

These organizations could have annual meetings and co-operate with the farmer's institutes. The joint meetings could last several days. The program should represent all kinds of live stock and farming. In the meantime horse breeders could have an annual colt show, allowing free entrance to all. A qualified judge could be procured. This should be an excellent time to educate the mare owners.

This may seem to be a dificult task, but it is sure to get results if started and properly followed up.

SERVICE RECORD BOOKS.

There is probably nothing as important in the breeder's equipment as a good, reliable stallion service record book. We received so many inquiries for a reliable record book that two years ago we were compelled to prepare one. All of the record books which had been printed before were used in making up this form. We believe we have now the cheapest and most convenient service record book on the market. The calendar is good for 1912 and 1913, so that if these books are not used this year they will be good for next year. The price is 50 cents each or six for $2. We have received hundreds of testimonials similar to the following:

"Please send me six stallion service record books, as we have used them and can't do without them. Please find enclosed $2.00 for the books, and send them as soon as convenient. Logan Brothers, Pendleton County, Kentucky."

BEST TRADE ACCEPTS NO SUBSTITUTES.

If you want to have an idea of just how scarce really good draft horses are—and will continue to be, for some time—consider the following from Dr. C. W. McCampbell of the Kansas Agricultural College:

He says that "High class draft horses are selling for $225 to $500 each. The majority sell around $300 each. This condition of the market has existed all during the past year, and yet less than 5 per cent of the ket would measure up to the best paying standard.

"Many firms in cities," he says, "are forced to use motor trucks simply because they can't get good, heavy, sound draft horses. The expense of running these auto trucks is considerable, and many of these companies are ready to exchange them for draft horses just as fast as they can get desirable ones."

The disappointments in the horse business have been largely due to a mistaken idea, that because sound animals of the best conformation and action, weighing 1,700 pounds and better, were selling high, that smaller, inferior horses could be worked in as cheap substitutes when the supply of good ones failed. The demand for the best is not one that permits of substitution—in horseflesh. The people who buy this kind (and they are the best buyers in the world) must either have a horse that meets their requirements or they will fall back on the motor truck, and the sooner the horse growers of this country find it out the more money it will mean in their pockets.

To Owners of Mares

While the spring months are doubtless the most important of the year, to the successful breeding of mares and raising of colts, it is also true that every month of the year has its problems of importance to mare owners. Every month of the year these timely questions will be discussed in the columns of the American Breeder and every helpful discovery or development in the business will be clearly set forth.

This constant attention to the special affairs of horse, mule and jack raisers is only one feature of the American Breeder, which makes it a welcome, regular, twice-monthly visitor in the homes of more than 40,000 people interested in better live stock. Our up-to-date handling of matters pertaining to the use and breeding of other lines of live stock has won us as much commendation as any work we ever undertook—the best evidence we could have of the breadth of intelligence of the thousands, who, beginning through their interest in the horse business, have helped to spread the influence of the American Breeder over the best all-round live stock states of the Union.

A large number of stallion and jack owners, from time to time, pay for the subscriptions to the American Breeder for many of their patrons. This is done as an appreciation of their patronage. We hope the mare owners who have received the paper in this way will appreciate the kindness by calling on stallion owners during the breeding season and thanking them for the courtesy.

We suggest that all mare owners read the paper carefully and pay particular attention to their mares through the early season, as this is the dangerous time. When mares are not accustomed to work—to change of feeding conditions—changeable weather and the shedding process, it is the easiest time to take cold by being allowed to stand and cool off rapidly after being worked hard.

We also advise all mare owners as a rule not to start to breeding too early. Three-fourths of the colts that die are lost before May 1. Mares settle better after the weather gets warm and they have assumed their natural condition—being more accustomed to work and change of feed and weather.

Many stallion and jack owners will advertise a barren mare day. On this date mares which have not been producing foals should be brought for examination, and treatment if necessary. Mare owners and stallion owners must work together for the best results. The stallion owner who is progressive will use every possible means to get the mares in foal and not to convey diseased conditions from one mare to another. When a stallion or jack owner does not make an examination of all mares bred, but breeds all mares presented, he should be considered with some suspicion. Many valuable mares are made barren by being served by a stallion or jack which has previously served a diseased mare.

The American Breeder will gladly answer any and all questions concerning live stock for you free of charge. The questions and answers alone in each issue are worth many times a year's subscription to any mare owner. In addition we regularly print important articles on breeding subjects—articles that cannot be obtained elsewhere. All subjects will be handled that concern the best interests of the live stock industry. If you wish to continue to enjoy this kind of service we solicit your subscription. The price is 50 cents a year or three years for $1.00. You can send your subscription to the Graham Publishing Company, 225 West 12th Street, Kansas City, Missouri, or you can give it to the stallion or jack owner who has favored you.

We say this because we want no one to let the coming of the busy months cause him to postpone renewing his subscription until fall. There is too much of importance that will be missed during the summer, and even in the busiest season there is no live stock paper which gives its readers so much for the time they put on it, as does the American Breeder.

PARTIALLY PERSONAL

A motto does no harm if it is lived up to. It may fool a few of the more unsophisticated among the trustfuls, if it is not. That is all for the motto.

On a dull day the Associated Press revived the old story to the effect that Frank Rockefeller, the Kansas ranchman and breeder, is not on speaking terms with his brother, John D.

James Houchin, of Astral King fame, and a big man at Jefferson City, Mo., which town he has made famous as the home of Onward Wilkes Stock Farm, is in the race for the Missouri governorship.

When Dean Webster of the Kansas Agricultural College said that an exclusive wheat farmer could not make a living in the western fourth of his state he was not trying to be popular but was merely speaking from a real knowledge of conditions.

Dr. Paul Fischer (state veterinarian of Ohio) and his ten assistants are credited with having given the simultaneous serum treatment for cholera to 100,000 hogs without the loss of a single animal. Dr. Fisher at one time headed the veterinary department of the Kansas Agricultural College.

Prof. Holden of the Iowa Agricultural College is being talked of for his state's next governor. Aside from the fact that he is a good man with a strong backing, the "consummations devoutly to be wished," which are likely to be realized in the event of his success, make his candidacy especially the concern of breeders and farmers, without as well as within the state.

At last the farmer has been saved from threatened peril by timely apprisal of the awful truth—his seed corn needs testing. The Associated Boards of Trade broke the news to him. Prior to that the bankers had told him the same thing, following in the rendering of this invaluable service close upon the daily papers, which had lost no time in repeating the message the railroads had been sending to the farmer, via their "good seed trains." To be sure the farmer had heard the same thing annually from the farmers' institute lectures, the farm papers and the seed houses—and they do say he has had his own suspicions all along.

THE LARGER HORSE MARKETS.

St. Louis is the largest horse market in the country. Its receipts in 1911 were 170,379. The total of receipts at Chicago was 104,545, while Kansas City was third with receipts of 84,651. Other cities high up in the standing: St. Joseph, Mo., 52,023; Ft. Worth, 37,361; Omaha, 31,771. The grand total for the six leading markets was 470,940, as compared with 375,100 at these markets in 1910.

PANAMA, A RACING HAVEN?

It is now reported that "the racing game," discouraged by the laws of many states, is to find a haven of refuge near the city of Panama. It has only lately been announced that Panama is to have an up to date race track. There will be a three months race meet there next winter, with all the trimmings in the way of "sassiety" and a miniature Monte Carlo on the side.

Possibly the most interesting part of the announcement, says a dispatch to the Kansas City Star, pertains to the erection of a casino on an island, ten miles from shore, where baccarat, roulette and "other similar games" will be permitted. The casino is to be very exclusive, according to report, with admission by card only. A motor boat service will be inaugurated to the island, while the race course will be reached by electric railway, now under construction.

STOCK FEEDING AT BEET SUGAR FACTORIES.

The feeding of beet pulp, sugar beet tops, sugar beet syrup and alfalfa has become an important industry in the Yellowstone valley of Montana, and the largest single stock feeding outfit in the state is at the sugar factory at Billings, handled by Charles O'Donnell, David Fratt and Frank O'Donnell. They are fattening 4,000 cattle and 20,000 sheep. The feed lots cover nearly 160 acres.

Immense quantities of alfalfa and straw are used in connection with the beet pulp. Alfalfa is also ground and mixed with the beet syrup to make a balanced ration for both sheep and cattle. All of this stock is being brought to a high finish and finds a ready market, mostly to the west or Pacific coast. The shipment of cattle and sheep from Eastern Montana to Western markets has assumed large proportions.

One of the features of the feed lots this winter is a short horn steer from off the range, which weighs 2,150 pounds, and which they expect to bring up to 2,500 by spring.

In addition to the cattle and sheep at the sugar factory there are about 5,000 cattle and 50,000 sheep on alfalfa in the valley, while many more are expected in before winter comes. Among the larger feeders are Hesper farm, with 8,000 sheep; Rea Bros., with 9,000 sheep; J. B. Long, with 6,000 sheep, and others feeding sheep and cattle.

WHO HAS HAD THIS EXPERIENCE?

To the American Breeder: I have been taking your paper for the past year and think the letters from the breeders are very interesting, and contain many helpful ideas. I have never written anything for publication but would like to know if any other breeder has had anything like the following experience:

Say you have a mare that is in good flesh and apparently healthy that will take the horse regularly every twenty-one days for four or five times or more, then refuses on the 18th, 21st, 27th, and up to anywhere from thirty-five to sixty days, then comes in heat again, then when served gets in foal. I have had several mares that acted in this way and about 90 per cent of them get in foal. Has anyone else paid any attention to cases of this kind, and can they give an explanation for it? Joe S. Collings, Putnam County, Indiana.

SHIPPING HAY TO SAVE CATTLE.

An example of what the winter just ended has meant to live stock owners over a big western area which usually enjoys a long grazing, and short feeding season, is suggested by a recent record purchase of alfalfa hay on the Kansas City market.

Otto Schwaller of Hays, Kas., was the buyer and his purchase amounted to twenty-six cars or nearly 400 tons, for which he paid at the rate of $20 per ton. Freight alone, from Kansas City to Hays, will be close to $1,200 on the shipment and before the hay is finally fed out, handling and other expenses, will run the total cost well up toward $10,000. The hay had been shipped to Kansas City from Idaho, probably over the same road that took it out to Hays, the Union Pacific.

W. B. Carpenter, President.
Trenton, Mo., Kansas City, Okla. City.

SAVE MONEY ON HARNESS

OUR PRICE WHOLESALE $26.65
AS SHOWN, LESS COLLARS.

This New "Favorite" Team Harness is only one of many that we offer at a money-saving price and it is a fair sample of what we can do for you in the harnessline.

THE NEW "FAVORITE" HARNESS

is made of an exceptionally good grade oak-tanned leather, in the style shown. It is very popular, both for farm work and city teaming, made to prevent sore backs, warranted to stand up under general farm work, and to give splendid service. Our guarantee of satisfaction or money back goes with every set. If you wish to do so, we will allow 30 DAYS FREE TRIAL to show our confidence in this harness, which we guarantee for one year from date of purchase.

OUR FREE HARNESS CATALOG describes the New "Favorite" fully, also a complete line of harness, harness parts, robes and buggies, blankets nets, saddles and vehicles of all kinds. Be sure to get this book if you are in the market for anything in the Harness line from a strap to a full set. Write today for this book.

STALLION SERVICE RECORD BOOK

Every Stallion or Jack owner Should have this record book, because it is accurate. It is a handy pocket size, with a Waterproof cover, printed on best of paper.

It has a calendar, also a gestation table. It has an index of ten pages, so that each mare can be found easily It has room to give a complete record of each mare. 100 mares can be recorded, each mare having a whole page. The blank at the bottom of each mare's page, when properly filled out and signed gives you a promissory note that is legal and binding.

If you ever use one of these records you will want more of them, just as thousands of others are doing. It has no worthless advertisements in it. It is the latest Stallion Record Book on the market. If you are not satisfied with it, return it, and get your money, which will be cheerfully and promptly refunded to you.

PRICE: 50c EACH, OR 6 BOOKS FOR $2.00

An Important Poultry Test

Hens Must Deliver the Goods. Fanciers Points of No Avail in National Egg Laying Contest. S. C. Reds Lead. Three Breeds Tied For Second.

THE first four months of the National Egg Laying Contest, the biggest and most important and instructive event of the kind ever conducted in the United States have passed, with what are known as the early laying breeds still in the lead. Gains, however, are being made by the Leghorns and other persistent layers, which did not show up so well at the outset. Thrice the monthly prizes (cups given by the different breed associations) for the biggest pen yield have been won by Orpingtons and once by Rhode Island Reds; and the Orpingtons, which naturally were expected to make their best showing early, have kept well toward the top of the list.

The record for February was a very gratifying one. A total of 6,442 eggs were laid in the 29 days, which was double that of the previous month, and more than one-half of the grand total for the previous three months. The grand total to March 1 was 17,845 eggs.

During February the Single Comb Reds went from second to first place and now head the list, the leading pen having 310 eggs to its credit. The Black Orpingtons, which have been leading for three months, dropped back one notch, and the Buff Orpingtons and Silver Wyandottes tied them for second place, each of these three pens of five hens having 309 eggs to their credit, each pen being only one egg behind the leading pen in the contest. White Wyandottes moved from eight to sixth place. Barred Plymouth Rocks and White Leghorns have moved up until they are among the leading ten varieties of the thirty-nine varieties competing for places in the contest.

The highest individual records made at the close of the fourth month are as follows:

	Eggs.
No. 346—S. C. Reds, Mrs. Emma Powers	96
No. 402—Silver Wyandotte, G. C. Grant	89
No. 79—R. C. W. Leghorn, C. E. Cronhardt	86
No. 541—White Orpington, A. M. Robertson	86
No. 883—White Orpington, Dr. Thomas Dietrich	85
No. 545—White Orpington, A. M. Robertson	83
No. 821—Cornish Indian, Peter Erickson	83
No. 888—Columbian Plymouth Rock, Clyde Patterson	82
No. 315—S. C. Reds, W. J. Ward	80
No. 790—Silver Wyandotte, V. G. Warner	78
No. 401—Silver Wyandotte, G. C. Grant	78
No. 572—R. C. Reds, M. L. Puckett	77
No. 373—Buff Orpington, Miss S. C. Fellows	77
No. 863—Black Orpington, E. A. Berg	75
No. 525—Silver Wyandotte, Jacob Miller	75

This contest is being conducted at the Missouri State Poultry Experiment Station at Mountain Grove, Mo., under the supervision of the Missouri state Poultry Board, through its secretary, T. E. Quisenberry. The entries number 786 hens and pullets, representing 39 breeds. There are 665 hens in the 131 pens entered, and 131 substitutes (one for each pen entered) kept in reserve to supply a possible loss of one hen from a pen. The "super numerary" nature of the "rooster" for egg production alone, is being demonstrated by his entire absence from this contest. Twenty-five states and Canada are represented in the 131 pens in the contest. Missouri breeders have entered 58 pens. Kansas and Illinois come second with nine pens each. Iowa has eight pens entered, Indiana seven and Ohio four. Canada, Pennsylvania, Virginia, Nebraska and Michigan each have three pens; Alabama, Arkansas, Massachusetts, Louisiana, Texas and Wisconsin, two each, and Colorado, Florida, Georgia, Idaho, New York, North Carolina, New Jersey, Washington and West Virginia, one each.

The houses used are of the colony type, shed roof and open front, protected by an old fashioned window shutter. They are original, and of a different construction from the ordinary colony houses used at the present time—differing from them principally as to ventilation, light and arrangement. These houses were built with a view to simplicity, economy, comfort and health of the birds at all seasons of the year.

These birds come from all classes of breeders, some who have bred carefully and scientifically, and others who have bred carelessly and in a haphazard manner. A pen of ordinary barnyard chickens has also been entered, classed as scrubs, and a comparison of the results from pure breds and "scrubs" will be watched with a great deal of interest. So far the "scrubs"—a mixture made up more or less of the same blood represented by the breeds, and presumably selected because they were good layers—have given the pure breds a run for their money, the "scrub" pens total for the four months being 178 eggs, or higher than any of the breed averages excepting Orpingtons (Buffs, Blacks and Whites), Single Comb Rhode Island Reds, Silver Wyandottes, Black Langshans and Buckeyes. In other words, 30 of the 39 breeds represented show pen averages below their mark.

Following is a record of the four months' totals, by pens, of the better known breeds of chickens.

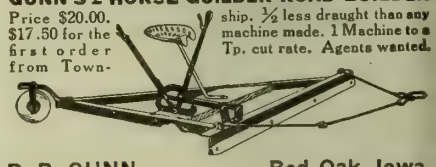
EGGS OF INDIAN RUNNER DUCKS. From imported blood. Noted for shape; wonderful egg production; large white eggs. Grand prize record. **M. H. Schlotzhauer, Indian Runner Duck Specialist, Pilot Grove, Mo.**

Buff Orpingtons

Eggs from Standard bred hens. Cock, golden buff, scoring 95 by Russel; 15 eggs, $3; mature pullet eggs, $1.50. **Carl D. Adams, Olathe, Johnson County, Kansas.**



STAPLES' BLACK LANGSHANS—Great winter layers. Some choice young cockerels, the best I ever raised. Some choice Duroc Jersey swine, young stock; male, females. Write today. Plainview Farm, Mrs. Jas. A. Staples, Mgr., Lamonte, Mo.

520 ACRE FARM FOR SALE. Lies connected—40 acres under cultivation and balance (mostly tiliable), is the best of wild hay and pasture land. Some fine alfalfa land in the creek bottoms. Pastures watered by spring and creek that never fail, and furnish plenty of water at barns also; 4 acres good orchard; improvements fair. Price $30 per acre. Address **Box 42, R. F. D. No. 1, Moline, Elk County, Kansas.**

320 ACRES OF GOOD PRAIRIE LAND. In good farming country, located between Holt and Knox County, Nebraska. Black, sandy loam; 30 feet to water; 8 miles to nearest R. R. town (PAGE) at $25 per acre. Will take in one Percheron stallion coming 3 and a few Percheron fillies. Must be registered in Percheron Society. **I have one Percheron stallion, coming three, sound and hard to beat, for sale at $500; or will exchange him for one of equal value. S. S. Langford, Craig, Burt Co., Neb.**

GUNN'S 2 HORSE GUILDER ROAD BUILDER

Price $20.00. $17.50 for the first order from Town-

ship. ½ less draught than any machine made. 1 Machine to a Tp. cut rate. Agents wanted.

D. B. GUNN, Red Oak, Iowa

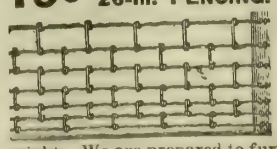
SINGLE COMB BROWN LEGHORNS

Eggs. The great all year laying strain. None better. My method for range insures strong, vigorous chicks, with vitality. Satisfaction guaranteed. $1 per 20; $2.50 per 40; $4 per 100 eggs.

Mrs. H. A. Brookhart, Arabela, Scotland County, Mo.

SAMPLE FREE

BROWN FENCE



You can examine Brown Fence and know just what it is before ordering or paying one cent. We mail you a sample showing size and quality of wire. When you get the sample, test it with a cold chisel and see how hard, tough and springy it is. File off the galvanizing and see how thick THAT is. All wires—both strand and stay wires—are No. 9 gauge, and made of the best grade of steel. Weighs ⅓ to ½ more to the rod than most fences, and will last double the time. A more rigid, firm, stanch, stock-resisting, time defying fence was never stapled to posts. **Price 15c to 35c per rod, and we pay the freight on 40 rods or more.** Write for catalogue showing 133 styles of fences. We also sell direct to farmers at lowest wholesale prices—Coiled Spring, Barb and soft Galvanized Wire, Gates and Poultry Netting. Save money by ordering direct from us. Address

J. G. Truman, manager Truman's Pioneer Stud Farm, writes if there is one thing above another that recommends a horse importing firm to its patrons it should be the fact of its being able to deal with customers continually from the first horse it sells them. That was plainly demonstrated this week when we had the pleasure of a visit from our old and esteemed customer, W. H. Hansen, Abilene, Kas. This gentleman is proprietor of a stud of pure bred Belgian mares and had been on the hunt some time for a strictly high class stallion to place at the head of his stud. He finally selected the chestnut, rising three-year-old colt, Jesus. He is one of those low, wide-as-a-wagon kind, standing on the best of feet and joints; hard, flinty bone and everything that goes to make a strictly high class draft horse. Messrs. Green Mullineux & son, who purchased from us some time back one of the best Percheron stallions in the state of Missouri, selected one of the gray Shire stallions that are so popular in draft horse communities. This colt, March Ringleader, was champion at the Minnesota State Fair last fall and second at several other state fairs and the International, only being beaten by our champion Royal Grey. This colt was very highly praised by the press in their reports of the shows where he was exhibited last fall. Messrs. Rhea Brothers of Arlington, Nebraska, purchased a rising three-year-old Percheron stallion weighing around 2,000 pounds, an extraordinary individual, and one that will do his new owners a great deal of good. Our importation that arrived last week are doing fine and are, taking them all round, a great lot of horses. We shall be pleased to mail our 1912 catalogue to anyone requesting same.

Mr. Crownover of Hudson, Ia., writes: "I want to state to prospective buyers that my Percherons, Belgians and Shires are in fine shape for the trade; they are the best lot of horses I ever owned. The 2-year-olds are weighing 1900 to 2000 pounds; 3-year-olds and over, 2000 to 2200 pounds; they have passed a veterinary examination and received a state license, every horse passing sound, so buyers need have no fear of getting an unsound one handed them. Among the recent sales is a large red-roan Belgian to the Genesee Horse Co. of Buckingham, Ia., a 3-year-old Percheron to Fred Bremer of Ocheyden, Ia., four Percherons to Canadian buyers, a pair of Shire fillies to Broomfield & Story of Belle Fourche, S. D.

Taylor & Jones of Williamsville, Ill., write: "We are pleased to see such an improvement in your paper and it is sure an interesting paper. We are glad to report a good lot of sales. Our new importation has arrived and we can suit anyone wanting a good horse at the right price. We buy our stallions right to start with and buy the right kind. Then we give our customers the right kind of a deal. We can show a line of Percherons, Belgians and Shires which can not be seen at any other place in America for the kind of prices we ask."

Al E. Smith, Lawrence, Kas., has a large selection of large boned, high class Mammoth black jacks, with large, well shaped heads, long tapering ears, great length and depth of body. He can show all the height, finish, weight, bone and breeding required in a good jack. Smith does not have one or two good ones, his herd is made up of large, high class fellows, the kind that get the large mules. He has jacks that sired mules from small mares weighing 600 pounds at weaning and sold for $125 and $130 at weaning. His prices are reasonable and it appears that he pleases his buyers. He says he has sold one man two jacks every year for five years, the man selling them after the season, comes back and buys again. Mr. Smith is always willing to show his stock and his buyers say they feel at home and are well entertained when at his farm. Phone him when you reach Lawrence and he will meet you.

General Jose Miquel Gomez, president of the Republic of Cuba, has just bought a three-year-old stallion, Alican 4286, from the Cook Farms at Lexington, Ky., and six walk-trott mares. The Cuban commission who bought a number of jacks, stallions and Jersey cattle from the Cook Farms last September were so impressed with this great young stallion that negotiations were at once taken up between the president and the Cook Farms and the deal has just been closed.

Five Nebraska and Iowa farmers were in South Omaha last week and bought Percheron stallions from Singmaster & Walker. The quality and prices of their horses so appealed to these men, all of whom had visited other barns that the sales were made about as quickly as the horses could be shown. This company is selling big drafty stallions that weigh from 1,800 to 2,2000 pounds at "cut prices."—Nebraska Exchange.

The Cloverdale Farm writes that they have thirty-five as good Kentucky Mammoth jacks as can be found in any barns. They have five by the great Dr. McChord 1766; four by Paymaster 819; two by Greatland 1470, one of the greatest show jacks ever in Kentucky. Gen. Boyle 3662 is a brother to the great show jack Ben Franklin, who is a winner of many championships. Every jack buyer should write for their circular, or visit Cloverdale Farm.

David Moir, whom many breeders in Kansas City territory will remember in connection with some of the best Hereford herds, sends greeting from Bitter Root Valley in Montana, where he is a regular subscriber to the American Breeder. George Sims, he says, is still with A. B. Cook, and helping make the Cook Herefords better every year.

STALLION and JACK CUTS

We can furnish cuts for bills, letter heads and all kinds of stallion and jack advertising.

A New Line, True to Life, The Best Work, Prices Low.

Send for sample sheet and subscribers' prices.

Royal Belgians

Imported and home-bred stallions and mares; first and second prize winners at Hutchison State Fair; from the best known strains; for sale at "live and let live" prices. Every horse guaranteed as represented. For particulars, write, or better, come and see. **David Cooper & Sons, Freeport, Harper County, Kansas.**

IMPORTED BELGIAN STALLION.
My coming 2-year-old Belgian stallion, **imported in dam,** 2d prize winner in National Belgian Breeders' Futurities. Color chestnut, weight 1,600 lbs. If you want a good one write for price, or better come and see him. **C. W. McDermott, Wiota, Cass Co., Ia.**

IMPORTING PARTNER WANTED

¶ An opportunity to get an even start with old, well established horse importing firms. About $20,000 capital required and some knowledge of Draft horses,as I want a partner who can handle the money and keep in close touch with the business at all times.

¶ The proposition is sound and parties can write me in strictest confidence.

¶ Address **L. K., care American Breeder, 225 W. 12th St., Kansas City, Mo.**

CLYDESDALES

AVONDALE STUD FARM has on hand the greatest collection of CLYDESDALE STALLIONS to be found on the Continent. The best FIVE CLYDESDALE STALLIONS at the 1911 IOWA STATE FAIR were shown by them. Visit their stables where you can see more TON CLYDESDALES than all our competitors combined. If on the market, write them for catalog, prices and terms. Address,

Leitch & Sons
Lafayette, Stark County, Illinois

GALBRAITH'S CLYDESDALES

Famous the world over for three-quarters of a century. Present stock the best we ever had. No tail ends. Every horse we have is a show horse.

More international prize winning stallions over three years old for sale in our stud than all competitors combined.

Remember the Clydesdale is the coming popular breed and has won 80 per cent of all leading prizes in competition with the best of every other draft breed at Chicago.

ALEX GALBRAITH & SON, DeKalb, DeKalb County, Illinois.

CLYDESDALES FOR SALE.
Imported and home bred mares, some of them in foal to the imported stallion, Baron Kent, half brother to the $47,500 stallion, Baron of Buchclytre. Well matched pairs and sired by some famous sires. Also the imported stallion, Baron Kent, guaranteed and sure foal getter. If you want good ones, write for prices. **David Wilson, Breeder of Clydesdales, Hebron, Porter County, Indiana.**

CLYDESDALES.
I have a car load of Clydesdale stallions, selected by Robert Miller, of Stouffville, Ontario, from the best herds in Canada, that I will dispose of at as low prices as possible, considering their quality and breeding, to make room for another load. **R. O. Miller, Lucas, Lucas County, Iowa, R1.**

CLYDESDALES

Registered Clydesdale Horses and mares; some of them closely related to the famous "Baron of Buchlyvie," who sold in Scotland recently for $47,500. For further information apply to **John Sparrowhawk, Wakefield, Clay Co., Kan.**

FOR SALE.

A draft stallion and jack. **Frank Longenecker, Albion, Edwards County, Illinois.**

PERCHERONS

Some extra good young stallions and mares in foal. Plenty of bone and quality. A 2,100-lb. stallion at head of herd. Will offer some bargains in this month.

Also one good registered saddle mare in foal. **A. M. Walker, Fairview Stock Farm, Laclede, Missouri.** All this stock is registered.

PERCHERON STALLIONS FOR SALE or EXCHANGE

One coming 5, and one coming 4, jet black; sound; weight, 1,800 lbs., at maturity. Right wind and gentle. Would exchange for cheap land or registered mares. Sickness; I must change climate, reason for selling. Your price is mine. **A. B. Like, Blue Earth, Faribault County, Minnesota.**

PERCHERON STALLIONS.

Five two year olds, two three year olds, one five year old, one six year old herd stalion, black, weight 2,200 lbs. Brilliant breeding, all out of imported stock, sired by high class sires. Good ones in every way and registered in P. S. A. Stud Book. For sale at reasonable prices. Want to get out of business on account of poor health. **H. A. Rohrs, Napoleon, Henry County, Ohio.**

REGISTERED PERCHERON STALLIONS.

One gray, 3-year-old; weighing 1,760 lbs. One balck, 6-year-old; weighing about 2,000 lbs. Both have been winners at the Butler County Fair. Priced to sell.

J. H. Kidd, Mars, Butler County, Pennsylvania, R. 30.

PERCHERONS FOR SALE

We are offering an extra choice lot of stallions from 2 to 6 years old. They are the large drafty fellows that the farmers like and the kind the market demands. All stallions recorded, and sold under a written guarantee. Will price them where they will sell and on terms to suit. **Singmaster & Walker, Union Stock Yards, South Omaha, Douglas County, Nebraska.**

REGISTERED PERCHERON AND SHIRE STALLIONS.

For sale:—One Shire stallion, 6 years old; 2 Percheron stallions, 5 and 6 years old. Are better than ton horses. Also one Percheron, 2 years old; weight, 1,950 lbs. One Percheron, 1 year old; weight, 1,450 lbs. For further information, address, **Bradley Bros., Davenport, Thayer County, Nebraska.**

BURRESS BROS. Percheron & Belgian HORSE BREEDERS

We have a fine lot of horses for this spring trade; all ages, from suckers up.

We also handle the best grade horses in the Northwest. Wayne county is noted for producing big drafters. Parties wanting good, big-boned draft colts, pasture raised, will find them at our farm. Prices reasonable. **Burress Bros., Carroll, Wayne county, Nebraska.** 60 miles west Sioux City, Iowa; 120 miles northwest of Omaha on the C., St. Paul, M. & O. Ry.

EXCELLENT PERCHERONS

From 1 to 3 years old Stallions sired by G. L. Carlson's Nicholas. I have 2-year-olds that weigh over 2,000 lbs and yearlings over 1700 lbs.; also a number of good registered mares. This stock is choicely bred, well developed and will be priced reasonable.

Write George Hirschman, Pierson, Woodbury County, Iowa.

AMONG THE BREEDERS

One of the most catchy and original live stock catalogs we have received comes from the Onward Wilkes Farm of James Houchin, Jefferson City, Missouri. And it goes without saying that the little book is neat and handsome typographically.

L. R. Wiley, Emporia, Kansas, has 75 head of mares and stallions for his customers to choose from. All stock registered in books approved by the government.

John Leitch, Lafayette, Illinois, advertises Clydesdales, both imported and home bred. Write him for booklet and photographs.

Imported Percheron, ton stallions, are priced at $1,000; also imported mares at $450 to $550, by H. Redenius, Rushmore, Minnesota.

Galbraith's Clydesdales, advertised in this issue are worthy of notice and investigation. Write to Alex Galbraith & Son, of DeKalb, Illinois, for catalogue.

Scott, Abney & Jenkins, Virden, Illinois, have 20 head of black jacks for sale, with lots of size, bone, quality and style. Also 200 mare mule colts, for sale in car load lots.

The Leavenworth County Jack Farm, of Corson Brothers, Potter Kansas, has 42 head of jacks and jennets advertised in this issue.

John Sparrowhawk, Wakefield, Kansas, has lots of good Clydesdale horses and mares, some of them closely related to the famous Baron of Buchlyvie, who sold in Scotland recently for $4,700.

G. H. Minton, Forest City, Missouri, has a few Mammoth jacks and jennets. Also a ton imported black Percheron stallion, 7 years old, advertised in this issue. Write him.

T. E. Collins & Son, Belleville, has six good jacks for sale; two that are extra good. Mr. Collins will pay car fare if jacks are not as represented. Read his advertisement in this issue.

G. M. Scott, Rea, Missouri, will sell one or a car load of black registered jacks at reasonable prices.

Philip Walker, Moline, Kansas, has 25 head of jacks and 40 head of jennets. Read his advertisement and write for prices.

A fine assortment of Mammoth jacks can be found at the Fairview Jack and Jennet Farm. All guaranteed as represented. Write J. C. Huckstep, Eolia, Missouri.

W. S. Jetton & Company, Murfreesboro, Tennesse, have 26 large Tennessee jacks from six to seven years old, also 24 jennets. Read their advertisement in this issue.

Joe E. Wright, Junction City, Kentucky, breeder of Mammoth Kentucky jacks and jennets, would be pleased to have you visit his farm or write for prices.

Notice the advertisement of Walker Bros., Oklahoma City, Oklahoma. It contains important announcements concerning their draft and coach stallions.

Reading the edvertisement of Joseph Rousselle & Son, Seward, Nebraska, will convince you of the excellence of their facilities for bringing the best in Percherons and Belgians to this country, and selling them worth the money, to American buyers.

More evidence that the stallion business is good has just been received from Lew W. Cochran of Crawfordsville, Ind. He reports selling 16 stallions in the last ten days. Some of them going to Manitoba to be exhibited at the winter shows of Manitoba and Sask.

Notice the new advertisement of Henry Lefebure, Fairfax, Iowa. He has one hundred stallions and mares on hand this time.

WANTED

Percheron mares, stallions or jacks, in trade for Industrial Stocks, Land or Automobile. **H. B. Alderson, Devils Lake, Ramsey County, N. Dakota.**

G. W. Goehler, Route 5, Fort Worth, Tex., an experienced stallioner, with six years' experience in artificial impregnation, is open for a position with a good reliable breeding establishment.

G. W. Harris of Lawrence, Kas., has three Standard bred and registered trotting stallions advertised in this issue, and is going to sell some one a bargain.

The finest dates from the Sahara Desert succeed in our Southwest.—From the 1911 report of the United States Secretary of Agriculture.

(Continued on page 12).

FIVE BLACK PERCHERON STALLIONS

Percheron stallions and mares for sale. Five stallions of breeding age, all black. This stuff is all home grown.

L. M. Phelps, W. D. Phelps, Trumbull, Clay County, Neb.

MAPLE POINT PERCHERONS

60 HEAD ON HAND

CRANDALL & DANFORTH

RANDOLPH, MINN.

Extra good imported and home bred **Draft and Coach Stallions** from $800 to $1,400, 2 to 5 years old, including many state fair prize-winners; recorded in U. S. approved books (not recorded grades) and fully warranted. Also **mares and jacks. WALKER BROS., Oklahoma City, Okla.**

RIVERSIDE STOCK FARM.

A fine bunch of large registered Percheron stallion colts, coming 2 and 3 years old. 3-year-olds weigh 1,600 to 1,850 lbs. 2-year-olds, 1,450 to 1,550 lbs. The large boned kind. Three standard bred stallions all registered from 15¾ to 16 hands high. One black Shetland pony stud 6 years old. A fine breeder. All stock guaranteed as breeders.

A few large Mammoth black jacks.

Two carloads of mules from 3 to 4 years old, from 15 to 15 hands high. **O. L. Thisler & Sons, Chapman, Dickinson Co., Kan.** On main line U. P. R. R.

Percherons, Jacks and Jennets

Imported and home-bred black Percheron stallions, 4 and 5 year old ton horses. Seven big, black Mammoth Jacks, from 1 to 7 years old. Ten black jennets, all ages. Come and see us. Farm four miles from Raymond or Chase. **J. P. & M. H. Malone, Chase, Rice County, Kansas.**

REGISTERED PERCHERON MARES.

For Sale—Blacks and grays, sound and the best of quality. From four to seven years old. **H. J. Winget, Trivoli, Peoria, County, Illinois.**

FORD STOCK FARM

Your choice of imported Percheron and Belgian stallions at $100 profit. We will sell you your choice of any stallion at $100 profit and show you their cost in plain figures. INVESTIGATE. **Ford & Harrington, Parker, Turner County, South Dakota.**

PERCHERONS, STANDARD AND JACKS.

Two Percheron stallions, black, 5 and 6 years old; 1,950 and 2,200. Sound and registered. Hobson took first in the open class with 5 importers in the ring, and 1st in the American bred class at the Nebraska State Fair, 1909. He is a heavy boned, square framed horse and weighs 2,200 lbs. Tricon is 6 years old. Was my choice out of a herd of 200 head of the best stallions I ever saw together. Also Bud Mason 42689, standard and registered, by Penrose 4912. Bud scores 98, or 2 points less than perfect. Will sell or trade for saddle stallion. Also 4 jacks from 15 to 15¾ hands, Standard; as good as grow. All registered and fine performers. All of this fine stock is for sale, as I have just turned into my 72d year and can't handle them and will close them out right. **Wm. H. Patterson, Mound City, Holt County, Mo.**

PERCHERONS

Imported Percheron, ton stallion, $1,000; imported mares, $450 to $550 each. Home bred, registered stallions and mares, $200 to $450.

H. Redenius, Rushmore, Nobles, Co., Minnesota.

PERCHERON STALLIONS AND MARES.

Two stallions; one coming 3-year-old in April. One coming 2-year-old in May. These are extra good colts, with lots of bone and quality. Will be priced worth the money, as I want to sell.

Also one pair of mares, 3 and 6 years old. These mares are black and weigh 3,500 lbs. **George Barber, Oak, Nuckolls County, Nebraska.**

PERCHERONS.

Brilliant D. 45336. The great show and breeding stallion, a 2,300-pound black. Heads the herd stallions with size and bone from 1 to 4 years. Also mares bred to Brilliant D., and a few good mares and fillies sired by him. All blacks and grays, and sound. Address **Edgewood Farm, West Branch, Cedar County, Iowa.** Farm and stock, ½ mile east of Downey, on main line C., R. I. & P.

STALLIONS

For Sale—Percheron, English Shire, road stallions; mares and colts of all 3 breeds at farmers' prices. Our motto is, live and let live.—**E. P. Hamilton & Sons, Garden Grove, Decatur county, Iowa, R. 2.** Two miles Northeast Garden Grove.

Imported Horses $1,000 Each

Home-bred registered Draft Stallions, $300 to $600. All horses warranted sound and sure breeders.

Reference—Any bank in Osceola.

HART BROS., Osceola, - Iowa.

YOUNG STALLION
Registered With Percheron Society of America.

Coming 3 years old; dark gray; weight, 1,820 pounds; medium flesh; plenty of vim, with good disposition. Besique and Volatire blood. Sound; a typical drafter. Priced to sell. **Fruin Bros., Gilman, Iroquois County, Illinois.**

EXTRA GOOD PERCHERONS.

If you want an extra good home bred or imported Percheron stallion or mare, selected and imported by myself, running in weight from 1850 to 2400 lbs., and prices as low as the lowest. Come and see me. I defy competition. This stuff must be moved at once to make room for my next importation.

Also two standard bred trotters, 3 and 4 years old. One by old Baron Wilkes, the other by Expedition; both out of Nannie Dillon by Baron Dillon, by old Baron Wilkes.

S. J. Miller, Kirksville, Adair Co., Mo.

You have time
Our barn is the place
We have the Stallion

You need him, why don't you drop in? Not just one **Stallion;** a whole lot of them; **a barn full.**

Percherons, Belgians, Coachers

Don't be misled by wind-jamming ad writers. Don't buy until you have seen our Stallions. Don't buy an inferior horse and then complain. Buy a good one of us and be satisfied.

Talk or write to our old customers; they are buying of us a second and third time. Why? Because we give them a "Square Deal" and always handle the good ones. Call and see us. Write us. We will answer.

GEO. W. SOUERS & SONS
601 to 949 West Matilda Street
HUNTINGTON INDIANA

Imprecation

The sensational prize winning Percheron stallion, IMPRECATION (79214) 79304, imported by us in 1911. Gray horse, foaled April 24, 1908. Weight 2,200 pounds.

First prize winner, three-year-old class, and grand champion stallion at the International Live Stock Show, Chicago, 1911, and the ONLY HORSE IN AMERICA HAVING THE DISTINCTION OF BEING SUBSIDIZED BY THE FRENCH GOVERNMENT for use in France.

As a large number of breeders of pure blood Percheron horses are desirous of breeding to this great horse, we have decided to accept a limited number of approved mares for the season of 1912, at our farm, Lafayette, Ind.

TERMS.

$100, cash at time of service, to insure mare in foal. Should mare fail to prove in foal, she may be returned free, or breeder may substitute another mare free of charge; and if horse should be sold, or not in our possession at the time mare is returned, money will be refunded.

Mares sent here will be carefully cared for on pasture, free of charge, and if fed grain, reasonable charges will be made. We will not be responsible for accidents.

All who want to take advantage of the opportunity to breed to the "GREAT CHAMPION" should write us at once. Picture and breeding of IMPRECATION sent on request.

We have 100 to 200 head Percheron, Belgian, German Coach and Hackney stallions and mares always on hand.

J. Crouch & Son, Lafayette Stock Farm, Lafayette, Indiana.

My November Importation Percherons, Shires, Belgians

Are in fine shape. I have 2-year-olds weighing a ton; 3-year-olds and over, 1900 to 2300 lbs.; sound and right in every way, and suit the most critical buyers. Every horse is guaranteed as represented. A veterinarian's certificate and state license is furnished with every horse. Pedigrees are right. Send 10c for picture of horse parade.

Wm. Crownover, Hudson, Blackhawk County, Iowa.

REGISTERED PERCHERON STALLION.

Having five head of big boned stallions, from yearlings to five years, weighing up to a ton, will sell some of them at prices that will make 'em go. Have used one for two years and have fine colts to show from two seasons. **D. Teinert, York, York County, Nebraska.** R. 4. 2½ miles northeast of McCool Junction.

Look! Look!

We have a number of good big first class young Percherons and big black jacks that we will sell at a very low price, and guarantee same, if taken at once. Fisher & Walker, Evansville, Vanderburg County, Indiana.

RHEA BROS.
PERCHERONS

We exhibited fourteen Percherons at the late Nebraska State Fair and won 17 prizes, as follows: One silver medal, one championship, seven firsts, two seconds, three thirds and three fourths. Now, remember that we showed our home bred horses in the same classes with the imported stallions and won First every time, bar one. So much for the show. The important thing to be considered is "how does the whole lot show up?" and that is exactly where we are strong. Our two-year-olds, some of them still in the pasture, weigh from 1,600 pounds to 1,900 pounds. These weights guaranteed.

We always claimed to have the big boned kind, and this season we are sure we have better bone than ever, cleaner joints and better feet.

Don't lose sight of how we raise these colts, in the pastures winter and summer, until coming three-year-olds. That's why they are hardy and prove breeders from the start.

Our horses are acclimated, its importance cannot be over estimated. We have stallions coming two, three, four and a few older ones for sale at prices that are very reasonable. Every stallion sold under a full guarantee; can furnish life insurance for two-thirds value at cost.

Write for pictures, descriptions, prices and any information you may want.

Arlington is on the main line of the C. & N. W.R. R. 28 miles northwest of Omaha, 8 miles east of Fremont and 55 miles north of Lincoln. Twelve passenger trains daily.

Arlington, Nebr.

PERCHERON AND BELGIAN STALLIONS AND MARES.

Our horses are all good clean sound fellows, with plenty of bone. Our ton horses weigh 2000 pounds.

All Stallions have been passed on by the Stallion Registration board of Nebraska, and all pedigrees have been passed by the Department of Agriculture at Washington D. C.

We have five mares that average 2100 lbs. One team that weighs 4440 and all of them are sound.

Come to our barns and see some of the best horses in the United States.

FRANK S. WEST & SON
THE SQUARE DEAL HORSEMAN
Wood River, Neb., and Hamilton City, Cal.

IMPORTED PERCHERONS AND BELGIANS

Stallions from 2 to 4 years old. All acclimated and sure foal getters. All solid colors, black, gray, sorrel and bay, and broke to work. Good, clean bone; good full eyes; straight movers and first class in conformation; weighing from 1,800 to 2,300 pounds.

We are natives of France and buy only from reliable breeders, saving our customers a lot of money. As a rule our horses are prize winners, wherever they go, and a reliable guarantee goes with each horse sold. Come and see us or write.

JOS. ROUSSELLE & SON, Seward, Seward County, Nebraska.
25 miles west of Lincoln, 65 miles east of Grand Island.

IMPORTED PERCHERONS AND BELGIAN STALLIONS AND MARES
PERSONALLY SELECTED WITH CARE

Good, big, rugged kind. Also home bred stallions. All bought so they can be sold. One importation Oct. 10th. Last importation Jan. 18th. If interested write or see me. Horses are kept at the track.

Bell Phone 237 R or Union Hotel **J. R. JUSTICE** *At Union Hotel GALESBURG, ILL.*

PLEASANT VIEW PERCHERON STOCK FARM

I have for sale a choice lot of imported and home-raised Percheron stallions and mares. A number of them are sired by the famous horse Barnum, that was champion at the International in 1904. Prices reasonable. Come and see them and I will save you money. Marcus is located 44 miles northeast of Sioux City on the I. C. R. R., in Cherokee County.

Chas. P. Quirin, Marcus, Iowa.

IMPORTED AND HOME BRED PERCHERON AND BELGIAN

Stallions; reasonable prices. Nothing but the best. Lew. Jones, R. 1., Alma, Wabaunsee County, Kansas. Barn at Wamego, Kansas. On U. P. R. R.

Percherons, Belgian, German Coach stallions and mares, all ages, imported and home bred and hard to beat. Prices reasonable; terms to suit; 70 head to select from. **A. R. Ives, Delavan, Walworth County, Wisconsin.**

AMONG THE BREEDERS.

(Continued from page 10.)

Wm. H. Patterson, of Mound City, Missouri, offers for sale two prize winning Percheron stallions, five and six years old. Also four jacks, as good ington, Kansas. All registered.

If you would like to be an auctioneer—and there's money in the business—read the advertisement of the Missouri Auction School. The largest in the world. Offices at Trenton, Mo., Kansas City, Mo., and Oklahoma City, Okla.

A fine bunch of large registered Percheron stallion colts are offered by O. L. Thisler & Sons, Champan, Kansas. Also three standard bred stallions, and mammoth mules. Note their advertisement and write for prices.

Oscar Edwards & Son, of Hillsdale Stock Farm, DeSoto, Missouri, have some choice saddle stallions and mares priced to sell, and guaranteed to be as represented. Write them for catalog. They also breed Duroc Jerseys.

Bradley Bros., Warrensburg, Missouri, the home of the giants, have 75 head of fine jacks and jennets on hand, which won nearly half the blue ribbons at Sedalia, in 1911.

Your choice of Imported Percheron and Belgian stallions at the Ford Stock Farm, at $100 profit to them. Note their advertisement, and write to Ford & Harrington, Parker, South Dakota.

Dr. W. H. Richards advertises a fine importation of personally selected Percherons and Belgian stallions. Any one looking for a good stallion at a reasonable price should go and see them.

Crandall and Danforth, Randolph, Minnesota, advertise Maple Point Percherons; sixty head on hand. Write them for catalog.

Read the Visio advertisement in this issue. Price $2 per bottle.

Note the Absorbine advertisement, and write to W. F. Young, 388 Temple Street, Springfield, Massachusetts.

D. B. Gunn, Rek Oak, Iowa, has a two horse road builder advertised in this issue. Write him for catalog and particulars.

The Coleman Stock Farm, Creve Coeur, Mo., offers some fine stallions, some of them over 16 hands high with great style speed and action.

Thirty-four yearling mules, half of them mare mules, are advertised for sale by L. W. Hoyt of Barry, Ill. He also has some jennets, a Morgan stallion and a Percheron.

A. T. Shaw, Eldorado Springs, Mo., having sold his farm, offers for sale his Mammoth jacks and jennets. Must be sold before March 26. Read his advertisement in this issue.

Two Missouri jacks are offered for sale at half price by H. M. Davis, Richmond, Mo. Read his advertisement in this issue.

Steigleder Bros., Bunceton, Mo., have a nice young jack advertised in this issue. Write them for price. He has never been worked or misused in any way.

520 acres of farm land, with 40 acres under cultivation and the balance mostly tillable, with some fine alfalfa land in the creek bottom is advertised in this issue. Address Box 42,, Route 1, Moline, Kas.

50 registered jacks and jennets, and every one a black Mammoth, are for sale by Ed. Boen, Lawson, Mo. Read his advertisement.

Three registered jacks are advertised by W. H. Thomas of Mt. View, Wyoming. From one of these jacks and a 1100-pound mare Mr. Thomas has a nine month old mule 15 hands high.

David Wilson of Hebron, Ind., has some imported and home bred mares advertised in this issue. Some of them in foal to the imported stallion, Baron Kent, half brother to the $47,500 stallion. Write him.

H. B. Alderson, Devil's Lake, N. D., wants Percheron mares, stallions or jacks. Read his ad. in this issue.

An extra good herd jack, 6 years old, is advertised by H. Obermann, Freistatt, Mo. Also a few jennets bred to this jack. Write him for prices.

Read the advertisement of Owl Brand Cotton Seed Meal of F. W. Brode & Company, Memphis, Tenn., and write for their free booklet.

Read the advertisement keyed "O" in care of the American Breeder. This man wants 50 jennets.

Missouri registered Spanish jacks and jennets are offered for sale by Frank Bush, Villa Ridge, Mo.

STRONG MISSOURI LIVE STOCK ASSOCIATION.

At a recent meeting of stockmen held in Mexico, Mo., a consolidation was effected between the Missouri Live Stock Association and the Missouri Cattle Feeders' Association.

One immediate outcome of the consolidation was the organization of the Missouri Live Stock Shippers' Co-Operative Commission Company, to operate at the National Sock Yards in East St. Louis, Ill.

The company will be incorporated for $50,000, $25,000 of which will be preferred stock with a dividend of 10 per cent per annum, the remaining $25,000 being common stock.

The following directors (all of Missouri) were chosen: G. W. McAnich, Hughesville; James H. Starr, Centralia; C. F. Clark, Mexico; A. M. Guthrie, Marshall; D. W. Hensley, Buell; H. D. Wilcox, Renick; Heber Hayes, Salisbury; Thomas F. Murray, McCredie and F. D. McCune, Frankford.

The hog should not be considered a by-product of the farm, although he is the means of marketing the by-products. In cattle feed lots he utilizes the corn that cattle fail to digest, on dairy farms he is the means of obtaining a value for skim milk, butter milk and whey which otherwise would doubtless be wasted.

THICK, SWOLLEN GLANDS

that make a horse Wheeze, Roar, have Thick Wind or Choke-down, can be removed with

ABSORBINE REG. U.S. PAT. OFF

also any Bunch or Swelling. No blister, no hair gone, and horse kept at work. $2 per bottle, delivered. Book 3 E free.

ABSORBINE, JR., liniment for mankind. Reduces Goitre, Tumors, Wens, Painful, Knotted Varicose Veins, Ulcers. $1.00 and $2.00 a bottle at dealers or delivered. Book with testimonials free.

W. F. YOUNG, P.D.F. 388 Temple St., Springfield, Mass.

Don't Have a Blind One

"VISIO"

An Absolute Cure for **Moon Blindness**

(Opthalmia), Cataract and Conjunctivitis

Shying horses all suffer from diseased eyes.

"Visio" will convince any horse owner that it will absolutely cure defects of the eye, irrespective of the length of time the animal has been afflicted. No matter how many doctors have tried and failed, use "VISIO" under our GUARANTEE to refund money if it does not cure.

$2.00 per bottle, postpaid on receipt of price.

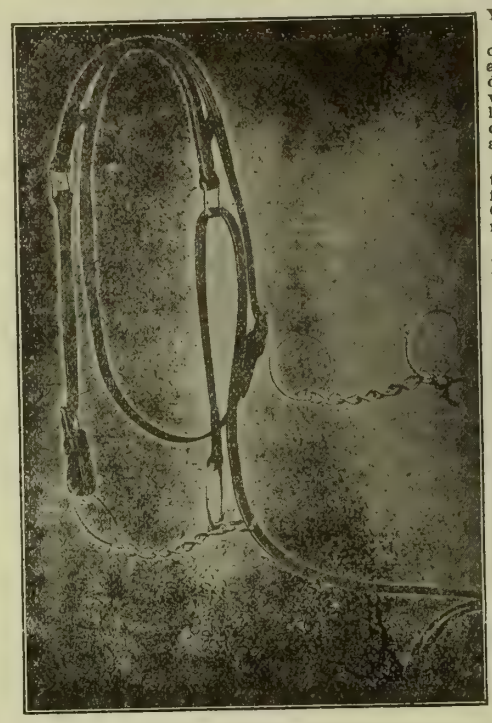
CLIP YOUR HORSES IN THE SPRING

It Pays—Clipped horses look better, feel better and do better work—Clip

With the Stewart Ball Bearing Clipping Machine

The only ball bearing clipping machine made. Do not buy a frail, cheaply constructed clipping machine that will last you only a season or two, and give trouble all the time. Every gear in this machine is cut from solid steel bar and made file hard. They all run in an oil bath, so friction and wear are practically done away with. It turns easier, clips faster, and lasts longer than any other clipping machine made.



We Guarantee it for Twenty-Five Years

Price all complete, only $7.50. Get it from your dealer or send $2.00 and we will ship C.O D. for balance. Write for our big free catalog. Try this machine out side by side with any other machine on the market, at any price, if this is not worth three times as much, send it back at our expense both ways, we will refund every cent you paid. Send today.

Chicago Flexible Shaft Company, Box S. & J., Chicago

Johnson Automatic Stallion Bridle

Patent Applied for Nov. 10th, 1909.

Manufactured exclusively by Peter Young, Assumption, Ill.

Controls the most unruly stallion without injury and will not hurt the kindest and most docile horse. Fits the largest draft stallion or the smallest roadster without adjustment. Made of the best leather. Shipment will be made on receipt of order, as I have them in stock at all times.

Order one, and if not satisfactory, return it and your money will be cheerfully refunded. Price $5, with order. Can be sent by mail. Read these testimonials:

"Enclosed you will find check for $5 for which send one of your stallion bridles to Mr. Jacob Haning, Minier, Ill. Please send at once and oblige.

"P. S.—I have been using one of your stallion bridles for some time. Would not do without it, as you soon have perfect control of your stallion in a short time. Please send bridle to Mr. Jacob Haning at once. Send by mail. Val. Thomas, Jr., Hopedale, Ill."

"I have used the bridle but a few days which I recently purchased from you, but must say no horseman can afford to be without it. It will hold any horse. There is no equal to it. I advise every horseman to have one. E. A. Berlin, Waterloo, Wis."

"Will say the bridle I ordered came all right. The horse that we wanted it for was one that we could not use with a chain under the jaw. Had to use rein over his neck and hard to hold back at that. The bridle surprised him very much. My son says he cannot say too much for it. De Mott & Son, Scottsbluff, Neb."

PETER YOUNG,
Assumption, Christian County, Illinois.

THE RIGHT WAY

IN ALL CASES OF
DISTEMPER, PINKEYE, INFLUENZA, COLDS, Etc
Of all Horses, Jacks, Mules, Brood Mares, Colts, Stallions, is to

"SPOHN THEM"

On their tongues or in the feed put Spohn's Liquid Compound. Give the remedy to all of them. It acts on the blood and glands. It routs the disease by expelling the disease germs. It wards off the trouble no matter how they are "exposed." Absolutely free from anything injurious. A child can safely take it.

50 cents and $1.00; $5.00 and $10.00 the dozen. Sold by druggists, harness dealers, or sent, express paid, by the manufacturers.

Special Agents Wanted.

SPOHN MEDICAL CO., Chemists and Bacteriologists, Box 834, GOSHEN, IND., U.A.S.

"HOW TO RAISE COLTS"

This book has been brought out by a stallioner, primarily for educational purposes for his own patrons.

Their many expressions of appreciation and the obvious advertising value to the stallioner are the reasons for offering it now to all other stallion owners for similar use.

It describes some of the most important processes involved, and difficulties met with in the production of colts and will aid the mare owner to keep his mares in better breeding condition and help to prevent losses from abortion, joint ill and other disorders.

MR. STALLIONER, EDUCATE YOUR CUSTOMERS! It will prove profitable to you as well as to them. Send 50 cents (refunded on quantity order) for sample copy and special low terms on 100 lots. Guaranteed to increase your business.

J. C. WALVOORD, Pub'r, Box 300, Holland, Lancaster County, Nebraska

Our Harness Horse Talk

Example of Pronounced and Persistent Type Furnished by the Dictator Branch of the Hambletonians. Five Generations of the Little, Black Race Horses.

Written for The American Breeder, by Henry Ten Eyck White.

The formation of a type is one of the results for which live stock breeders of all sorts have striven since the beginning of civilization.

In the case of many domestic animals—nearly all, in fact, a type has been secured, as witness dogs, sheep, cattle and chickens. In the horse line there has been marked success, especially with the drafters, and something in the same line is true of the thoroughbreds, although not as yet to a considerable extent. For about thirty years I have been watching the gradual development of the American light harness horse in the expectation that from the intelligent methods of mating followed by the enthusiasts who have fostered the industry there would come a distinct type of animal suited to the purpose named, but on going over the matter rather thoroughly in the last few months am compelled to admit that thus far the progress has been extremely gradual, and in the case of the best instance of type reproduction or formation thus far presented there are some undesirable factors.

The Dictator branch of the Hambletonian family furnishes the most striking instance of typical reproduction in five consecutive generations, and as the physical characteristics have been accompanied by a high rate of speed at the trot or the pace the example not only is a valuable one from the standpoint of those who place structure first in the formation of type, but likewise offers great encouragement to breeders who maintain, and rightly, that speed is the essential element in that particular class of horse. Here are the five generations, starting with Dictator, that have given us practically perfect types, both as to individuality and speed:

1863—Dictator, by Rysdyk's Hambletonian; dam by Seely's American Star.

1872—Director, 2:17, by Dictator; dam by Mambrino Chief.

1894—The Director General, by Director; dam by William L.

1899—Mainseet, 2:05, by The Director General; dam by Axtell, (3) 2:12; son of William L. ¼

1908—Mainleaf, (3), 2:08¼, by ainMsheet; dam by Ashland Wilkes,, 2:17¼.

To anybody who has seen the five horses named there can be no question as to their similarity in looks, size, action and color, every one of which points is important in a question of this sort. All were small horses, all were black, all had a bold, round way of going, and the family likeness is something to startle one. The speed began with Dictator. He was a brother to the champion trotter, Dexter, 2:17¼ (1867), and had a lot of natural lick, being up to a quarter in :35 in the days when the sulkies not only had high wheels but weighed about seventy-five pounds each.

Now Dictator did not sire a foal that could fairly be called a replica of the old horse until, in middle age, he was taken to Kentucky and mated with a big, coarse mare called Dolly, a daughter of Mambrino Chief. That foal was Director. He was a pony in size, but no better race horse ever marked the earth. He was a 2:30, 3-year-old when that sort of performance meant a lot, and a 2:17 trotter at maturity, beating all the best horses of his day in 1883, not losing a race that season. A year later one of the foals of Dictator was a tiny black fellow afterwards known as Jay Eye See, the first 2:10 trotter. His dam was a gray daughter of the gray stallion Pilot Jr., since famous as the best broodmare sire. If there was one thing more than another that marked the good daughters of Pilot Jr., it was the prevalence of the gray color, and they usually produced gray foals, as witness the case of Pilot Medium from the gray Pilot Jr. mare Tackey. The entire male ancestry of Pilot Medium were bays or browns, but his dam gave him the gray color, and most of his good trotters were grays, notably Jack, 2:12. It was not until the Pilot Medium blood met that of an even more poten strain (Young Sentinel), that the top member of the Pilot Medium tribe was a bay—Peter the Great—and the mingling of those two great broodmare strains produced the best Pilot Medium, no matter how looked at, in Peter the Great, 2:07¼, best sire of today.

But in the case of Dictator he controlled the color of his best foals, even when mated with mares that have amply proven their own potency, as from Dolly, the bay daughter of Mambrino Chief, he got the black Director, and from Midnight, the gray daughter of Pilot Jr., he got the black Jay Eye See. His other very fast foal of that period was Phallas, a bay, and although he trotted to a record of 2:13¾, then the best by a stallion, he sired practically nothing, and never could beat Director a race, losing to him four times when their respective records were 2:15½ for Phallas and 2:17 for Director. He is not to be compared with either Director or Jay Eye See, and his blood has not lived like that of Director.

Now Director and Jay Eye See were the best examples of the first generation of the Dictator family to follow the head of the house in all respects. Both were colt trotters of the first class in their day.

Director, placed in the stud, got one that filled the bill to a dot in the matter of physical characteristics. That was Direct, a black pony, trotting record under 2:19 in colthood, but chiefly famed as a pacer, record 2:05½ at that gait. Another colt nearly, but not quite a replica of Director, was his son Directum, 2:05¼, champion trotting stallion, a truly great colt trotter as well. He was a black, and, like Direct, he proved a good sire, now having five representatives in the 2:10 trotting list, the fastest of which is Ethel's Pride, 2:06¾, and 2:13¾ as a 3-year old. But a son of Director (black) that looks more like Director than did Directum, is The Director General. He has no record, but as a 2-year-old was such a wonderful trotter he sold for $2,500 at auction when values were low. An injury prevented his being trained, but it did not stop him from adding another trotter of the typical Dictator sort to the line in Mainsheet, 2:05, and it is safe to say no other member of the 2:05 trotting list ever reached that goal with as little training as did Mainsheet, because in youth he was troubled with severe lameness from a blind splint. The cause of the lameness removed he went to 2:05 in two seasons. In looks, size and action, Mainsheet would have made a first-class polo mate for Jay Eye See or Director, the type being perfectly preserved in him.

In 1910 Mainleaf, son of Mainsheet appeared, and that he was one of the colt cracks he showed by trotting second to Justice Brooke in the 2-year-old division of the Kentucky futurity in 2:11½, 2:09½. As a 3-year-old he took a record of 2:08¼ and won two heats in the Kentucky futurity when so lame it seemed cruel to start him. It has been truly said, that although beaten, none of the futurity colts that day came out of the race with more honor than Mainleaf.

Now there are four generations (consecutive) from Dictator in every one of which a little black stallion has been conspicuous, always a great trotter or a great sire or both. First Director, then The Director General, then Mainsheet, and finally Mainleaf. If Dictator and Director; Director and the Director General; the Director General and Mainsheet; Mainsheet and Mainleaf—if all those horses could be exactly reproduced when each was, say, three years old, there would appear such a perfectly wonderful harmony of color, heigh- conformation and trotting action that amazement would follow the sight. And if Jay Eye See, Directly and Directum could be added to the collection there would be more cries of wonder.

Directly, son of Direct, should not be forgotten. He was there with the color, and the conformation, and his speed was born with him, as he set the record for 2-year-old pacers at 2:07¾ and at maturity, after being turned out as hopelessly unsound, and patched up by the late George West for a race or two, he reduced it to 2:03¼ in a winning race where the class of the field was of the best. Directly, however, was a size larger than Jay Eye See or Direct, and a better example—indeed a perfect one—of the persistency of type is found in the case of the pacer King Direct, 2:05¼ (son of Direct), and King Daphne, 2:07½ at 3 years, son of King Direct. The last named was so small that as a colt he brought less than $100 at auction, but Geers made a high class pacer of him, and in turn he sired King Daphne, one of the best 3-year-old pacers of 1911. I saw King Daphne at the Dean place near Chicago last week, and he is the image of his sire, a little black pony, and has the same bold way of going, even though a pacer, that marked his great grandsire, the trotter Director.

King Direct's dam was Welcome Bunker by Mambrino King; grandam Lady Bunker (dam of Guy Wilkes, 2:15¼, a great sire), by Mambrino Patchen, and as Mambrino King was the best son of Mambrino Patchen there is a doubling up of that blood at close range. But all the potency of the Mambrino King blood, as well as that of American Star which came through Lady Dunn, his daughter, that was the dam of Lady Bunker, went for naught when opposed by that of the line of little black stallions starting with Dictator and then ending with Direct, the mare's foal, King Direct, being a Dictator all over, and a coal black, just as is his son King Daphne. Welcome Bunker is the dam of another good pacer, Cheery Lass, 2:03¾, but she is a bay.

When one looks at Daphne Direct today and recalls what a magnificent race he went last October at Lexington, where his record was made, he sees not only a wonderful little pacing pony, but he sees four generations of just such ponies, all black as night—the others being King Direct (p) 2:05¼; Direct (p) 2:05½ to high wheels, Director, trotter, 2:17 to high wheels, and back of those four generations of little black stallions stands Dictator, a little black trotter of good speed for his day, although it never was put in the form of a record.

No stallion other than Dictator can make any such showing, and yet, save in this one line through Director, his blood, on the male side, has pretty well run out. Those little black stallions, beginning with Director, have held their own against all other bloods in the matter of reproduction of physical characteristics and speed. In other words, though pitted against the most powerful strains of all other families the one from Dictator through Director has completely overwhelmed opposition.

It is not the most prolific or the best, speed alone considered, but when it gets speed the racehorse quality is sure to be there. In any event, the facts herewith submitted are of value and interest to every breeder and horseman. They teach a great lesson.

NOTICE TO BREEDERS.

Experienced Stallioner, with 6 years' experience with artificial impregnation, and three years with capsule system, is now open for a position with a good, reliable breeding establishment. Using capsules I have got seven mares in foal out of eleven, all bred in one day from one service of a sure foal getter.

Can furnish unquestionable reference. Address

G. W. Goehler, Route 5, Ft. Worth, Tex.

Registered Saddle Stallion

Splendid bay, large size. A true five gaited horse, with great style and action. Sound. A sure breeder and a good age for service. Will be sold for less than he will earn in one season. Must be sold; speak quick if you want him. **Kentucky Saddle Horse Company, Sedalia, Pettis County, Missouri.**

THREE STANDARD BRED AND REGISTERED

trotting stallions, and one A1 breeding jack. The stallions are:

Novar 26434, by Norvar, 2:14¾; Skeeter No. 45474, foaled 1904, by Novar; Mooltan Beauty No. 54891, foaled 1907 by Mooltan.

Come and see these. Am going to sell some one a bargain. Am quitting the business on account of wife's health. **W. H. Harris, Route 9, Box 10, Lawrence, Douglas County, Kansas.**

Saddlers For Sale

At private contract, I offer for sale the most fashionable strains and superb individuals in stallions and mares and fillies, by such sires as Rex McDonald 833; Rex Monroe 2063; Star McDonald 2526, and Fos McDonald 3096. All bred and developed by me. H. A. Greenwell, Lakenan, Monroe County, Missouri.

SADDLE HORSES

Of the most fashionable Chief breeding; yearlings and two-year-olds. Two mares in foal at a bargain. J. A. Tuttle, DeSoto, Jefferson Co., Mo.

SADDLERS FOR SALE.

We offer at private sale a fine lot of stallions, mares, geldings, colts and fillies. For catalog address, John T. Woodford, Mt. Sterling, Montgomery County, Kentucky.

Priced to Sell

Oscar Edwards & Son of Hillsdale Stock Farm, have some choice saddle stallions and mares. A couple of Percherons, and some of the best jacks and jennets that grow. Show stuff and prospects. Guaranteed to be as represented. They breed Duroc Jerseys, too. Write them. Box 402, De Soto Jefferson County, Missouri.

REGISTERED MORGAN HORSES

FOR SALE—Coming 2, 3 and 4-year-old stallions of large size, fine breeding and great style and action, high headed, clean boned and heavily muscled—the greatest all-purpose horse the world has ever known; fearless and untiring goers, but so level-headed that any lady can drive them; The Admiral 4871 A. M. R., 15¾ hands, weight 1,250 pounds, at head of stud. He was sired by Jubilee De Jarnet. Prices moderate. Send for catalogue.

A Generally Improved Market

Horse Demand Strong With Moderate Receipts. Meal Fed Quarantine Cattle Highest Since 1910. Stockers Up 25 to 40 Cents. Hogs Half Dollar Higher With Supplies Stationery.

The following table shows receipts of live stock in Kansas City less for this year, compared with the same period in 1911:

	1912.	1911.	Inc.	Dec.
H. & M...	25,046	31,410	.....	6,364
Cattle. . .	319,366	382,824	.....	62,457
Calves. . .	18,260	30,972	.....	12,712
Hogs. . . .	712,014	601,948	110,166	.....
Sheep. . . .	460,463	453,349	17,114	.....
Cars.	25,058	27,549	.....	2,491

Strong Demand for Horses.

In the past few days demand for horses and mules was the most active of the season, and inquiry seemed to come from all directions. A number of orders had been delayed on account of the unfavorable weather, and these were swung into the competition with considerable urgency. Prices for the most part were advanced $5 to $10 a head over two weeks ago. Quality also showed a material improvement, and Eastern buyers were afforded an opportunity to expand on their orders. One of the features of the market was some choice heavy drafters that brought $275 to $300. They had quality, weight, color and action. Most of the horses coming now are short in flesh, and where Eastern buyers can pick up a bunch in good condition price is rather a secondary consideration. The South is filling delayed orders for good workers of the medium weight class, and farm demand is also a feature in the demand. Construction work is looking to heavy mules for motor power, and the trading throughout is active. Dealers are predicting an active trade from now until the hot weather in July slackens demand. All sorts of work is six weeks to two months behind, and in most cases the shortage of feed caused the average holder of horses to reduce his holdings during the winter to a minimum. An Eastern buyer said recently that when work of all kinds was well under way that three Eastern states would be able to care for all the heavy drafters offered. This is probably a little exaggerated but shows that buyers have confidence in an enlarged demand for the next few months.

Prevailing prices for serviceably sound horses and mules, four to seven years old, are as follows:

Drafters, 1,700-pound up....	$165@250
Drafters, fair to good.....	140@165
Chunks, good	125@155
Chunks, fair	95@135
Southerners, good to choice..	125@150
Southerners.	75@125
Driving horses.	65 up

Mules.

13½@14 hands	$ 90@125
14½@15½ hands	120@175
15½@16 hands	165@240
16 @16½ hands	225@285

Weather Still a Big Factor.

The markets are still unable to shake weather conditions. In the past two days returns to higher temperatures have caused a general thaw, and consequently country roads are in the worst condition of the year. Such stock as are coming are those close to shipping points, and stock from six to twelve miles from railroad points cannot be driven through the mud. This applies more directly to Eastern Kansas, Missouri, Illinois and Iowa. In sections where the ground is a sandy loam mud is a less restrictive condition. Under such uncertainties prices for cattle in the two weeks ending Saturday advanced 25 to 40 cents, and at the close last week were the highest this year. In the past two days the market turned easier, largely because prices were too high for a ready disposition of beef. There is nothing in the future that indicates a decided slump in values, at least not until grass fat cattle begin to move, and that will be more than three months yet. In the meantime scarcity which seems probable may cause a further advance. Such cattle as were bringing $6 to $6.50 a year ago are selling now at $7.50 to $8.25 and not many of them are available. With the close of the Lenten season less than three weeks off demand will be stimulated. Illinois and Iowa, and Eastern Nebraska are the only sections in the corn belt that have any amount of cattle on feed, and the bulk of them are moving to Chicago, where weekly receipts are running more than the combined supply at other markets. Texas, with meal fed steers, and Colorado, with hay and sugar beet pulp steers, are the two most promising sections for future supplies. Texas may get in the running later with some steers fed cotton seed cake on the early grass, but as yet the grass is not up enough for such feeding.

The higest price paid for steers at this market in the past two weeks was $8.25. They averaged 1,311 pounds, and while thick fleshed, they could not be termed finished steers. Other good to choice steers sold at $7.75 to $8.15, and for the most part were in the weightier classes. In the past two days, however, buyers have shown a stronger inclination to favor the handy weight cattle, and April will probably uncover a strong lead for the lighter weight classes. Some 1,229 pound steers sold at $7.90, and some 1,100 pound grades at $7.65, both top prices in their respective classes. Colorado steers sold up to $7.50, and most of the offerings thus far have brought $6.75 to $7.25. Only a few bunches of steers have been common enough to sell below $6.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers.....	$8.25@8.50
Good to choice steers.....	7.50@8.20
Fair to good steers.....	6.75@7.40
Common to fair steers.....	5.50@6.70
Meal fed, choice.....	6.65@7.25
Meal fed, common to fair...	5.60@6.60

Quarantine Cattle Good.

The cattle coming from below the quarantine line are relatively better than those coming from the corn belt. The large crop of cotton seed has made meal one of the cheapest feeds available, and the big part of that product is being fed below the quarantine line. So far this year 6,000 more cattle have been received from below the line than in the same period last year, while on the other hand, the supply of native cattle has decreased more than 60,000. The top price on the quarantine side in the past two weeks was $7.35. This is also the highest price paid since 1910. Other steers sold at $5.50 to $7, largely $6.25 to $6.75.

Butcher Cattle in Favor.

Moderate weather is working in favor of the lighter weight cattle, and butcher cattle, especially good heifers, are being sought by killers. According to countrymen the April and May supply of fat yearlings and 2-year-olds will be the smallest for several years past. Cows have sold up to $6; heifers up to $7, and yearling steers and heifers, mixed, up to $7.35. Nothing prime has been offered and to specify a top quotation on the finished kind would be no more than a guess. Bulls were quoted up another quarter and are now the highest this season. Veal calves sold up to $8.50 here, but in Chicago the top price was $8.25. In Chicago large supplies are coming from the dairy districts.

The following quotations are for the various grades of butcher cattle:

Choice.	$5.65@6.00
Fair to good	4.75@5.60
Common to good	3.75@4.75
Canners.	3.00@3.70
Heifers—	
Choice.	6.75@7.50
Good to choice.....	6.00@6.70
Plain to fair.....	5.00@5.90
Common.	4.50@5.00
Veal calves.	5.00@8.50
Bulls.	4.00@600

Spring Boosts Thin Cattle Trade.

The few warm days this week has rejuvinated the demand for stockers

(Continued on page 15).

34 COMING YEARLING MULES.

Half of them mare mules, and 13 two's, all mare mules but one. This is large bred stock in fine shape.

Some big black jennets. Two 15 hand jacks.

Registered Morgan stallion. Registered Standard bred stallion. High grade Percheron, dark gray; extra good; and a French Coach stallion that is made to order. Will price to sell. No real estate deals. Would change some stock. This ad will not appear again. **L. W. Hoyt, Barry, Pike County, Illinois.**

4 Good Jacks 4

Fifteen hands to 15-3, Standard measure, 3 to 5 years old. Also two good Jennets.

O. J. Rhodes, Lees Summit, Mo.
W. C. Martin, Pleasant Hill, Mo.

and feeders, after a long period of dullness. Countrymen will have a much shorter time this year to get their thin cattle, as the season has been so extreme and backward, and when they start orders will be of the rush varieties. Prices are up 25 to 40 cents from two weeks ago, and the supply continues moderate. Considerable trading is going on at the big ranches, on the basis of $40 to $50 a head for the threes and fours, and at $25 to $35 for the younger cattle..

The following quotations are for $25 to $35 for the younger cattle.

Selected feeders	$6.25@6.50
Good to choice feeders	5.75@6.20
Plain to fair feeders	5.25@5.70
Selected stockers	6.00¾6.40
Good to choice stockers	5.50@6.00
Plain to fair stockers	4.75@5.40
Stock calves	4.50@6.50
Stock cows	3.75@4.65
Stock heifers	4.00@5.50
Milch cows	35.00@85.00

Material Advance for Hogs.

With receipts of hogs slowly decreasing prices have been on the upgrades steadily in the past two weeks. The net advance for the past two weeks is 45 to 55 cents and prices now are practically at the highest level since last September. Kansas City and St. Louis are receiving the most meager supplies, and Omaha has been reporting heavy runs. Chicago is receiving about 50 per cent of the hogs moving, indicating that the big supply is centered in Iowa, Illinois and Indiana. However, Chicago prices remain about the same as at our river markets. Heavy hogs are selling at a slight premium over other weights, but the margin is less than two weeks ago, and light weight pigs have advanced the most. The entire run lacks weight and shows how short of feed the average farmer has been this year. Hogs weighing 250 pounds are an exception to the rule, and those at 185 to 210 pounds predominate. The market is well supported by the packers, in fact they are about the only buyers. The extent of the supply in the country will not be tested until country roads improve, and countrymen are given a fair chance to make shipments. Corn, however, is too scarce for holding many hogs back, and, as soon as grass is far enough advanced a good many will be turned out of feed lots. July is now forecasted a month of high prices.

Following are hog quotations:

Choice, 250@300 lbs	$6.95@7.10
Choice, 200@245 lbs	6.85@7.05
Medium weight	6.60@6.90
Light weight	6.00@6.65
Common to fair	5.75@6.60
Stags	5.50@6.75
Boars	4.50@6.25
Bulk of sales	6.80@7.00

Sheep Prices at High Level.

Prices for sheep this week were the highest of the year, an advance of 35 to 40 cents compared with two weeks ago, and fully 50 to 75 cents above the average of the first two months this year. Moderate supplies caused the advance. Lambs sold up to $7.55, yearlings $6.25, mothers $5.75, and ewes $5.50. Clipped sheep are beginning to move. The good to choice shorn lambs are quoted at $5.50 to $6, and sheep $3.75 to $4.75. More of these will come as the season advances.

TWINS 94 YEARS OLD.

An "oldest twin" contest has been going on in the papers recently. In this contest the winning entry came from Missouri—of course. The winners are Mrs. Kindness B. Disney of Osceola and Mrs. Patience R. White of Moody. Their ages on May 7 next will be respectively 94 years and 94 years. The ladies are Tennessee born and Baptist raised.

MULE KILLS WOLF.

To the American Breeder: On going around his ranch near here one morning this week, Mr. Ching W. Arnold found a huge wolf trampled to death. Upon making further investigation he found that there had been a battle royal between the wolf and a mare mule that was mothering a bunch of colts. The mule came out victorious, "reducing" the wolf 'to a pulp." Although the mule's muzzle and legs were covered with blood, she was only scratched in a few places.

The wolf was a fine specimen (male), weighing about 180 pounds.—A. G. James, Hermosa, S. D.

JACK AND JENNETT BREEDING QUESTIONS.

To the American Breeder: As I am just a new beginner in the breeding business I will write you for some advice. I have a jennet 3 years old in August that I wish to breed. When is the best time to breed her? I would like to breed her as early as possible. Have a young jack; made one season with him. He is 4 years old next July. Is it a good idea to let him to the jennet or not? I used the breeder's bag last season—that is the bag for jacks, and I think I will have good return when foaling time comes around. Will those bags injure the jack in any way?

What could I afford to keep the jack for by the year? Four of us bought him, and I do the keeping and standing. I have to use my own horse for teasing for the jack, and will breed about 100 mares with him next season by using the pregnator. We divide the season's money equally, each party standing his part of the license and taxes. Now, how much money should I have for the keeping of him when corn is $3 per barrel, hay $18 per ton, oats 60 cents per bushel, shipped stuff $28 per ton, and other food in proportion? Please answer this through your American Breeder.—N. C. Mitchell, Henry county, Kentucky.

About six weeks or two months after grass comes will be a good time to breed your jennet. The object is to have the foal after the jennet has had a week or two on the pasture. This will assist in delivering the foal, and the pasture is a good place for colts to drop. There is less danger from navel infection. Do not let this young jack serve the jennet, as it might make him a slow jack or a jennet jack. Breed the jennet with a capsule about two days after she goes out of heat.

Occasionally a jack will serve in a breeder's bag for years without much harm, but many of them are spoiled through this method. Some will serve for a year or two, then begin masturbating, which is a very serious proposition. Jacks serve in a breeder's bag better than stallions as a rule.

Your value as a keeper depends on the results you can get for the company. There are many keepers of high priced stallions and jacks worth $500 a month, while there are probably more that are expensive at any price. You are familiar with the cost of feed in your section, and know about what you could earn if you were following some other occupation. Since you have a stallion to attend to anyhow, you could afford to keep the jack for less money than if you did not have any breeding business. The price paid for standing stallions and jacks is from $200 to $500 a year as a rule. One of the reasons that many of the companies fail is because they employ an individual who can not get results.

A JACK CHALLENGE.

To the American Breeder: I have a three-year-old jack, black in color, with light points, height fifteen hands and three inches standard measure. He is 74 inches around the heart, 82 inches around the flank, 22 inches around the arm, 16 inches knee, 10 inches drum stick, 34 inches ear, and weighs 1,100 pounds. If anyone has anything better would like to hear from them.—C. A. Strong, Webster County, Missouri.

MAMMOTH JACKS AND PERCHERONS

STALLIONS FOR SALE—100 head of Jacks, Percherons and Standard Bred Stallions and Mares. Jacks from two to six years old, from 15 to 16 hands high. Percherons weighing from 1,600 to 2,250 pounds. And Standard bred horses of the most fashionable blood.

Breeding Appliances of All Kinds

Bending the Soft Metallic Point of the Carlson Semen Extractor After Being Inserted in the Uterus (Womb). The Neck of the Womb Will Bend to Meet These Conditions Without Injury.

The Carlson Semen Extractor and Capsule Syringe

Which can be used as an impregnator or for getting the fluid out of the vagina or uterus for filling capsules. This is the only way to use capsules successfully as 60 per cent of the services inject the semen into the uterus where it cannot be obtained otherwise. The syringe holds 8 ounces of fluid. This instrument is being used successfully by thousands of breeders. It is made of the best metal and can be taken apart easily and boiled, which is the only way breeding instruments can be properly sterilized. As shown in the illustration above, it has a soft metallic point at the end, which can be bent in any direction after it is inserted into the uterus. This is the only instrument that can be used for getting the semen out of the uterus. All necessary directions telling how other breeders are using the Extractor sent with each order.

Price $5.00 For a Limited Time.

Curved Metal Impregnator

This instrument is sold by other dealers for from $5 to $6. It is nickle plated, about 22 inches long, with a glass tube in it. Price $4.00.

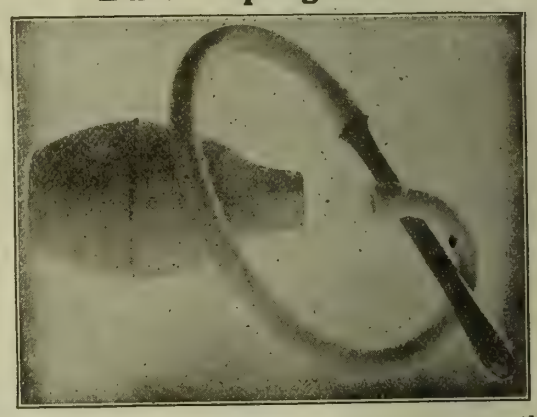
Microscopes

For use in testing the semen of stallions or jacks. Made especially for this purpose. Magnifies 500 times and is used by veterinarians and physicians. Price $35. Boxed in fine case. These instruments are of great value in the breeding business. Through them you can see for yourself and show your mare owner the live spermatozoa of your sire.

Thermometer

Tested and used for keeping water at the right temperature.

Price 75 Cents.



POINTED Breeding Capsules

We have the only capsules made especially for horse breeding. Some capsules do not dissolve, leaving a foreign substance in the uterus which will prevent conception. Other capsules are too flimsy to use for this purpose. You cannot make any mistake by buying capsules from us as we only have one kind. We have them boxed with 100 in each box. The box is tight so they will be clean. These capsules are properly baked and all bacteria killed before they are mailed. Always keep the lid on the box when not in use. Price per box (100) $1.50

Directions for Ordering

Send money orders or draft as exchange is always charged on personal checks. Always name your express office as well as your post office address in order to insure prompt delivery.

Bulb Impregnator

This is the best bulb impregnator on the market. Some dealers sell for $5 and $6. Price $2.

Breeders' Bags

Three sizes, small, medium and large. Stallions weighing 1,200 to 1,600 pounds usually require a medium size. These bags are guaranteed not to tear from any cause before March 1, 1913. If they do tear before that time return the top part with our stamp on it and 35 cents in cash and we will send you a new bag. Price, Each, $1.00.

Speculum

Made of good material, nickle plated, easily inserted, will last a life-time.

Price $3.00.

Emasculator

This emasculator (improved style) is made by the Kny Scheerer Co., and bears their trade mark. It is guaranteed to give satisfaction. If it breaks within one year or gets out of order, return it and get a new one. This instrument is made of the very best steel. It is the latest method, only having three pieces and can be taken apart very easily and thoroughly sterilized. It operates perfectly. Price, $7.00.

Veterinary Thermometers

This thermometer is recognized and used by the leading veterinarians for taking the temperature of animals. It has a metal case which insures it against breaking and will last a life-time. It has a small chain with pin in it that may be fastened to the vest pocket and carried with safety. Price, $1.25.

POSTAGE AND EXPRESS PAID ON ALL ORDERS.

TAYLOR & JONES
STALLIONS

Stallion buyers, why do Taylor & Jones sell more horses than almost any of their competitors? If you will stop to think, you will certainly know their horses must be better, their prices lower and their guarantee as good as can be written, as every man wants the best value for his money. We can please any customer in either Percherons, Shires or Belgians.

Our first importation in 1912 has just arrived at our barns and in the lot are many high class stallions, and as there has been no great expense on them as yet in the way of feed, care, risk, etc., we can sell them worth the money. If you are looking for a good horse, come and see us.

Taylor & Jones,

Williamsville, Sangamon County, Illinois

The World's Greatest Collection of

SHIRE STALLIONS AND MARES

PERCHERONS TO SUIT THE MOST CRITICAL BUYERS.
HACKNEYS OF RICHEST BREEDING AND STRONGEST INDIVIDUALITY.

Champions of Iowa, Minnesota, Wisconsin, New York and Illinois State Fairs this year. Our prices are the lowest. Our Horses are the Best. Send for our handsomely illustrated catalog. Mention The American Breeder when writing. First importation for 1912 arrived January 23. More to follow.

TRUMAN'S PIONEER STUD FARM, BUSHNELL, ILLINOIS

Imported Percheron Stallions
AT REASONABLE PRICES.

We have a large number of imported Percheron stallions and mares brought over last August, and will price them to you on **LOW MARGIN OF PROFIT.** We have cards, post cards, made of our animals and send them out on request. We also have newspaper folders of the entire shipment and would be pleased to have you ask for them if you feel interested. We are **FARMERS, BREEDERS** and **IMPORTERS** and will accord you fair and gentlemanly treatment if you deem it to your interest to give us a call.

J. O. SINGMASTER & SON
Keota, Keokuk County, Iowa.

RHEA BROS.
PERCHERONS

We exhibited fourteen Percherons at the late Nebraska State Fair and won 17 prizes, as follows: One silver medal, one championship, seven firsts, two seconds, three thirds and three fourths. Now, remember that we showed our home bred horses in the same classes with the imported stallions and won First every time, bar one. So much for the show. The important thing to be considered is "how does the whole lot show up?" and that is exactly where we are strong. Our two-year-olds, some of them still in the pasture, weigh from 1,600 pounds to 1,900 pounds. These weights guaranteed.

We always claimed to have the big boned kind, and this season we are sure we have better bone than ever, cleaner joints and better feet.

Don't lose sight of how we raise these colts, in the pastures winter and summer, until coming three-year-olds. That's why they are hardy and prove breeders from the start.

Our horses are acclimated, its importance cannot be over estimated. We have stallions coming two, three, four and a few older ones for sale at prices that are very reasonable. Every stallion sold under a full guarantee; can furnish life insurance for two-thirds value at cost.

Write for pictures, descriptions, prices and any information you may want.

Arlington is on the main line of the C. & N. W.R.R. 28 miles northwest of Omaha, 8 miles east of Fremont and 55 miles north of Lincoln. Twelve passenger trains daily.

Arlington, Nebr.

How Breeders' Associations Help

Their Work in Mitchell County, Kansas. Fair, Begun With Five Percheron Entries, Had One Hundred Last Year. A Campaign to Stamp Out Hog Cholera.

By J. M. Rodgers, Secretary, Mitchell County Breeders' Association.

IN the Industrial School for Girls at Beloit, Kas., and the State Reformatory for Boys at Hutchinson, not a single inmate has grown up surrounded by big, noble draft horses, broad back Shorthorn, Herefords and the Angus cattle, and other farm animals of the best. Knowing this, we conclude, scrub stock might mean, to some extent, scrub boys and girls. Children who grow up surrounded by noble animals can not help being ennobled; they can not do little things or have small thoughts. Believing this, and that the best way to bring about this condition in Mitchell county, would be to hold annually a strictly agricultural fair. The Fair Association was organized and in 1902 the first fair held under the present organization. While the progress to the goal of better live stock could be seen each year, we were not satisfied, so a few years later the Mitchell County Breeders' Association was organized to work in harmony and in connection with the Fair Association. While the two associations had different officers and organizations, they are practically the same, the same men being interested in both.

When we first organized the Breeders' Association, we started with seven members. We now have a hundred active members besides forty to fifty honorary members. When first organized the impression was that it was only for those breeding registered stock of some kind. As soon as this impression was dispelled and people knew that membership was open to all who were interested in the improvement of farm life, we gained in membership rapidly.

Our fee for membership is $1 with annual dues of $1. Any man, a resident of Mitchell county, can become a member of the association, by the payment of the membership fee of $1. All persons who exhibit at our yearly fairs, may become an honorary member without payment of any kind if they so desire. The names of all judges at our fairs and all foreign speakers at our banquets and meetings are placed on our rolls as honorary members. This throwing open the door for all residents of Mitchell county may seem broad to you, but it was made so with malice aforethought. We have bankers, lawyers, doctors and all classes of business men who are members, as well as breeders and farmers, and why not? They are as deeply interested in the improvement of breeds as the farmer or breeder; besides, the professional and business man of today may be the farmer and breeder of tomorrow.

We ask no question of the men who want to become members, but they are given to understand that if they wish to remain members they must deal honestly with all. For example, on March 30, 1911, a member of this association held a public sale of registered Percheron and French draft horses. The association went behind this sale, writing a recommendation, which was printed in the sale catalog, signed by the president and secretary of both the Fair and Breeders' Association. A short time after the sale rumors were circulated that all was not straight; charges were preferred against the holder of the sale, and a meeting was called of the association; the holder of the sale was notified of the charges and requested to be present. A committee was appointed to investigate the charges; they reported some weeks later at a called meeting of the association. Their report was accepted and Mr. Breeder's name was dropped from membership. He was forced to take back a mare he had sold at his sale as a registered Percheron, which, in fact, was a French draft mare he had substituted for a registered Percheron mare that had died. He will also have to return to the Percheron Society of America medals and cups won by false entries at the Topeka State Fair, and Beloit, Kansas State Wide Fair in 1910. He also stands a good chance of being dropped from membership in the Percheron Society of America, so you see when a breeders' association goes back of a public sale, the holder of the sale will have to deal honorably or lose in the end.

ON THE FARM OF ONE OF OUR READERS, IN A COMMUNITY WHERE THE SENTIMENT FAVORS IMPROVED LIVE STOCK.

Now, as to the influence on live stock in Mitchell county, since the two associations were organized. At the first fair, held in 1902, we paid as premiums on horses, $14.90. Nine years later, in 1911, we paid in premiums on horses, $446. Premiums paid in 1902 on cattle, $62.75; in 1911, $210.50. Premiums paid on hogs in 1902, $23.60; in 1911, $127.50. In 1911 there was a decrease of hogs instead of an increase from the year before on account of hog cholera. Poultry, farm products and all other entries, increasing at the same ratio. In 1902 you could count the entries of registered Percheron horses on the fingers of one hand. Nine years later, in 1911, nearly a hundred registered Percherons were on our fair grounds. In 1902 the farmer who used all pure bred sires was the exception; nine years later the farmer who does not use all pure bred sires is the exception. You ask me how this change has taken place. I can not tell you exactly. We, as an association, have simply driven a nail wherever we found a loose board. If you would ask one of these farmers who has improved his herd, why he came to do so, he might and he might not give credit to our association. I believe the germ of live stock improvement, like the germ of cholera, once scattered is bound to spread.

We believe that the "breaking of bread" cements friendship, and promotes good fellowship, so twice a year, in the spring and in the fall during our fair, we hold a banquet. After our banquet is over we talk shop. At our last banquet, in September, over three hundred men and women were seated at our tables. Our banquets are usually served by some society, generally by the ladies of some church. Our last banquet was served by the ladies of the Commercial Club of Beloit. It is wonderful what interest these banquets create. Men in all walks of life with their wives seated at our tables, all interested in the improvement of the farm and farm life. The first day after our last banquet, a lady who had attended the evening before but who had been reared in the city and knew very little of farm life, met me on the streets, said she was very much interested and had never known before how much there was to agriculture. Wanted to know a good farm paper to subscribe for. You see the germ will spread.

You all know how serious the hog cholera has been in the past year. We are taking this up as an association. You also know how hard it has been to secure serum to immunize our hogs. One of our members went to Manhattan to find a reason why we could not get serum to vaccinate. He came back and reported, short of funds, but if we would, as an organization stand good for 75,000 cubic centimeters, the college would send a man to Kansas City to buy a car of hogs and ship to the college and we could get our serum in a little over three weeks. It didn't take ten minutes before ten members stepped forward and made themselves responsible for over $1,000 worth of serum. This serum has been used, or nearly so, and some of our best herds of registered hogs have been saved, one herd consisting of over two hundred head.

I have told you a few things we have done in the past; now I want to tell you a few of the things we expect to accomplish in the future. We are going to stamp out hog cholera in Mitchell county. We are at present raising, among the breeders of hogs, $1,000 which will go to Manhattan for serum to be stored for future use. When we have sufficient stored so all can use it in immunizing their hogs we will see that the law is enforced; that not a sick hog is shipped to scatter the disease along the railroads and not a sick hog is hauled by wagon or driven along our public highways. Some hog raisers will probably not want to immunize, but when they find that they can not either sell or ship their sick hogs, they will be clamoring for serum.

We are going to encourage the teaching of agriculture in our county schools. This will have the effect of more of our boys and girls attending the State Agricultural College. We are going to keep driving nails until we have practically pure bred stock on every farm in Mitchell county.

A successful breeder's association can be described in two words: work and harmony. If you expect to have a successful association, you must work. It has been said, "That some men do large things, but the way in which they are done is small." Whatever a breeders' association does, whether large or small, should be done in a big, straightforward manner. The word harmony, in any association, means nearly all. It means, that kindly feeling we would have one for the other. It means the spirit to excel if you can, but if defeated, take it like a man.

I want to give you an illustration of what I mean. Three years ago at our fair there were three exhibitors of Hereford cattle. One had an exceptionally good cow in the aged class. When one of the other three showed up with his cow, she was also an exceptionally good one, and finally was given the blue ribbon. Did Mr. Man who was defeated sulk and say the

judge was prejudiced and didn't know his business? Not in this case. Along towards night when the championship between the different breeds of cattle was to be judged, I saw Mr. Defeated man, coat off, sleeves rolled up, with soap and water, comb and brush, making the toilet of the cow that had defeated his. And I want to say to you that she looked about right when she entered the show ring. This is the spirit that spells success and makes the breeding of good stock spread and grow.

A breeders' association wants the good will of every man in the county. They want to show people that they are not working altogether for self but for the good of all. If you can do this you will succeed. Last fall during our fair we had a rainy week. It looked like we would be way in the hole financially. Monday, following the close of our fair, our secretary received a check for $50 from R. M. Anderson, a lawyer in Beloit, who, so far as I know, has not a dollar invested in live stock or farms. He saw what the fair was accomplishing for the future of the farmers and being the big liberal hearted man he is, wanted a hand in the game. He was not alone, either, as nearly all our business men were exactly like him. I am glad to say we did not need their assistance. There may come a time when we do and what a satisfaction to know that it will be forthcoming when wanted.

It is wonderful what a little organization of men can accomplish. For the past two years it has been my pleasure to attend a fair held at Sylvan Grove, Kas., a town in Lincoln county, Kas., not a county seat town, either. One year ago they had what I would call a good fair. Several good Percheron stallions and a few aged mares were shown. Their cattle exhibit was good and everything else, just what you would expect to see at a county fair. Last fall, a year later, what improvement! Every class filled, a goodly string of aged Percheron mares with a splendid lot of weanling colts, and when the 2-year-old class was called, eight fillies were led into the ring and every one of the eight purchased and brought to Lincoln within the past year. Winners at the Kansas City Royal and several state fairs were among their cattle. And they had to go some to beat the home grown. This shows you what an organization of hustlers, like they are, can accomplish in a short time. I tell you the germ is deadly.

Now, I am not a prophet, but I believe if every county in Kansas had a good breeders' association, the hog cholera would be stamped out in a short time, the associations working together with the state live stock sanitary commission and the state veterinary department. Our farm animals would be so improved that (other states following our example) the cost of meat to the consumer would be lowered two cents a pound, and the working man's pail would be filled each day with more and better meat, and this without loss to the producer. For it is a well known fact by all feeders, that the better bred an animal is, the cheaper he can produce meat.

Now, a word to the young man who would like to help organize a breeders' association or start in the breeding of pure bred stock, I say, start at once. The future of the breeder and the farmer, to me, never looked so bright. Some of your old fogy neighbors may laugh and call you a fool and prophesy, "Your feet will strike the ceiling." Do not let them deter you. "The same wise man," Mr. Tourgee tells us, "when Noah was building the ark, sat around on dry goods boxes, whistled, laughed and derided Noah as a fool. The flood came and saved Noah's reputation and he has been considered a smart man ever since." I want to add to this, that if any of those wise men should have

(Continued on page 13.)

Why Not Fatten Horses Also?

Business That Affords Better Average Profits than the Fattening Of Cattle, Sheep or Hogs. Where Most Horses are Fattened. Opportunities in Horse Growing Sections

HORSE fattening for market as an industry is as yet undeveloped in the principal horse raising sections of this country. To Eastern states are doing most of the fattening of draft horses for market purposes nowadays. The farmers of the Middle West who raise the grain and have the thin horses are passing by this very profitable business. Several Ohio and Pennsylvania communities are today the greatest horse feeding points in the country. They buy their horses in Kansas City or Chicago or St. Louis, put them on their farms and fatten them for selling to New York city or other large Eastern cities.

These same sections that are noted as horse feeding points raise few horses as compared with places in Kansas or Missouri, which might fatten horses equally as advantageously. Those people in the West who raise the horses which are afterward fattened by Ohioans or Pennsylvanians, are often engaged in fattening other stock, but not in horse feeding, the most profitable of all live stock feeding. This statement as to the relative profitableness of horse feeding—and mule feeding may be included—is made upon the experience of horse feeders in the Middle West who have tried the business.

The buying of feeding horses for fattening has developed a market class termed "feeders." The "feeder" horse, of course, may belong to any class of equines, but are mostly thin drafters or chunks or express horses. The desirable points in a "feeder" are strength, a deep barrel closely coupled, a deep broad chest, well sprung ribs, strong and broad loin, with deep quarters and broad thighs. Long shoulders are preferred. The bone should possess quality so that the animal will look well when fattened. A mild disposition in a "feeder" makes fattening quicker.

Fat on a horse is just as desirable in the commercial markets as fat on a steer. It is this which makes horse feeding profitable, and lack of feeding to the man who sells his horses thin. It is well known that horses are bought in Kansas City and other points in the Middle West for shipment to Massachusetts or New York or Pennsylvania. The shipment of horses such as distance when not fat, brings them to their final market in very poor condition, which is one of the reasons why fat horses are in demand from horse raising sections direct.

The average city horse buyer is wary of a thin horse. His attitude is usually like this: He feels that the thin horse is thin because fat can not be put on it and would rather buy a fat horse and wear some of the extra flesh off in work than risk getting an animal that is not capable of keeping in good flesh. Big firms in many cities figure that their horses are an advertisement for their business, and they want them looking sleek from the start.

As an example of the profitableness of horse feeding in horse raising sections, dealers in Kansas City may be cited. One firm in Kansas City and a large dealer of New York city maintain barns at the stock yards, the rent of which figures up to several hundred dollars a month. In these barns many horses are fattened annually. This was started some years ago, and it has been continued annually since, showing that it is profitable despite the additional expense which must be faced. At first both stall feeding and pen feeding was tried, but the stall feeding is favored, although it requires more labor.

"Years ago," declared the foreman of the Kansas City feeding barn, "stall feeding would not have been as good as now. More care is being taken by horse raisers in the country, and when horses reach market most of them are accustomed to being tied in a stall. Of course a range horse that is not used to this does better in a pen. Other animals feel more at home, I would say, in a stall. They do not move around so much nor kick each other. I have found horses in pens so nervous that they gained but very little in weight. It is different with a mule. They do not become frightened or nervous when in a pen together. Stall feeding seems to put fat on a horse more solidly, which makes them ship better. The feed we use includes alfalfa hay and meal, oats and bran. We feed the horses three times a day with this and give them timothy and clover hay twice a day. I have seen big drafters put on as much as 10 pounds in weight daily with this combination of feed in a stall. Our feeding periods are from 60 to 100 days."

If—say in Kansas City, for example—stall room is rented at high prices and feed is bought at higher figures than in the country, and still horse feeding pays, why should it not pay the horse seller on the farm or in the country? Never have fat horses been as scarce as in the past season. Shippers have simply grabbed up the fat equines in every community where they found them. They wanted more fat horses than they found, and as long as they want horses they will want the fat ones in preference to others.

BRED 680 MARES.

To The American Breeder: Enclosed find letter and "argument against the Molly-coddle." This may give some reader and stallion owner an idea of how to work up trade. We bred 680 mares last spring. About two-thirds of them to the capsule and the result seems very good; used two jacks and one horse. This will show some of the stallion owners that it is the only way to make their stock pay. The American Breeder is a "ding hummer." Oak Ridge Stock Farm Co., Gasconade county, Missouri.

The hot shot for teh "Molly-coddlers," while too long to reprint here, doubtless does good service with some kinds of doubters.

Here is the letter Mr. Meier is sending out to his patrons about this time of the year:

Dear Sir: The season of 1912 is now at hand, when mare owners are again looking forward to their crop of colts, and getting ready for another crop. The main thing for mare owners is to look for the best sires. That is just as essential as any kind of seed. A poor sire means a bad colt, as it is impossible for an inferior sire to produce the best. We are proud to say that we have the stallions and jacks that are classed with the best. We have demonstrated that at the last colt show. This should be convincing proof. Don't take your mares to a sire because it is convenient, but take the time and bring them to us, we will give you the kind of colts you want, and bring you the best price. A cheap sire always means a cheap colt. The horse and mule market has always been good for the good kind; big stuff always is in demand; power is what everybody wants, and you can't get that by breeding to small sires. Breed your mares, if not all, then part of them to "Ikey," as it is only a matter of time when you will have the right kind of brood mares. Good brood mares must have bone, size and weight and that is what Ikey's colts have. Breed up your horse flesh, it will pay you big in time. A good big horse at maturity will bring even more than mules. Big horses are scarce and always bring the price.

We will be ready to take care of your mares in a satisfactory way, and get results. Wishing you success and a prosperous year, we remain,

Yours truly,
OAK RIDGE STOCK FARM CO.,
Per Fred C. Meier.

CARRYING THE SEMEN.

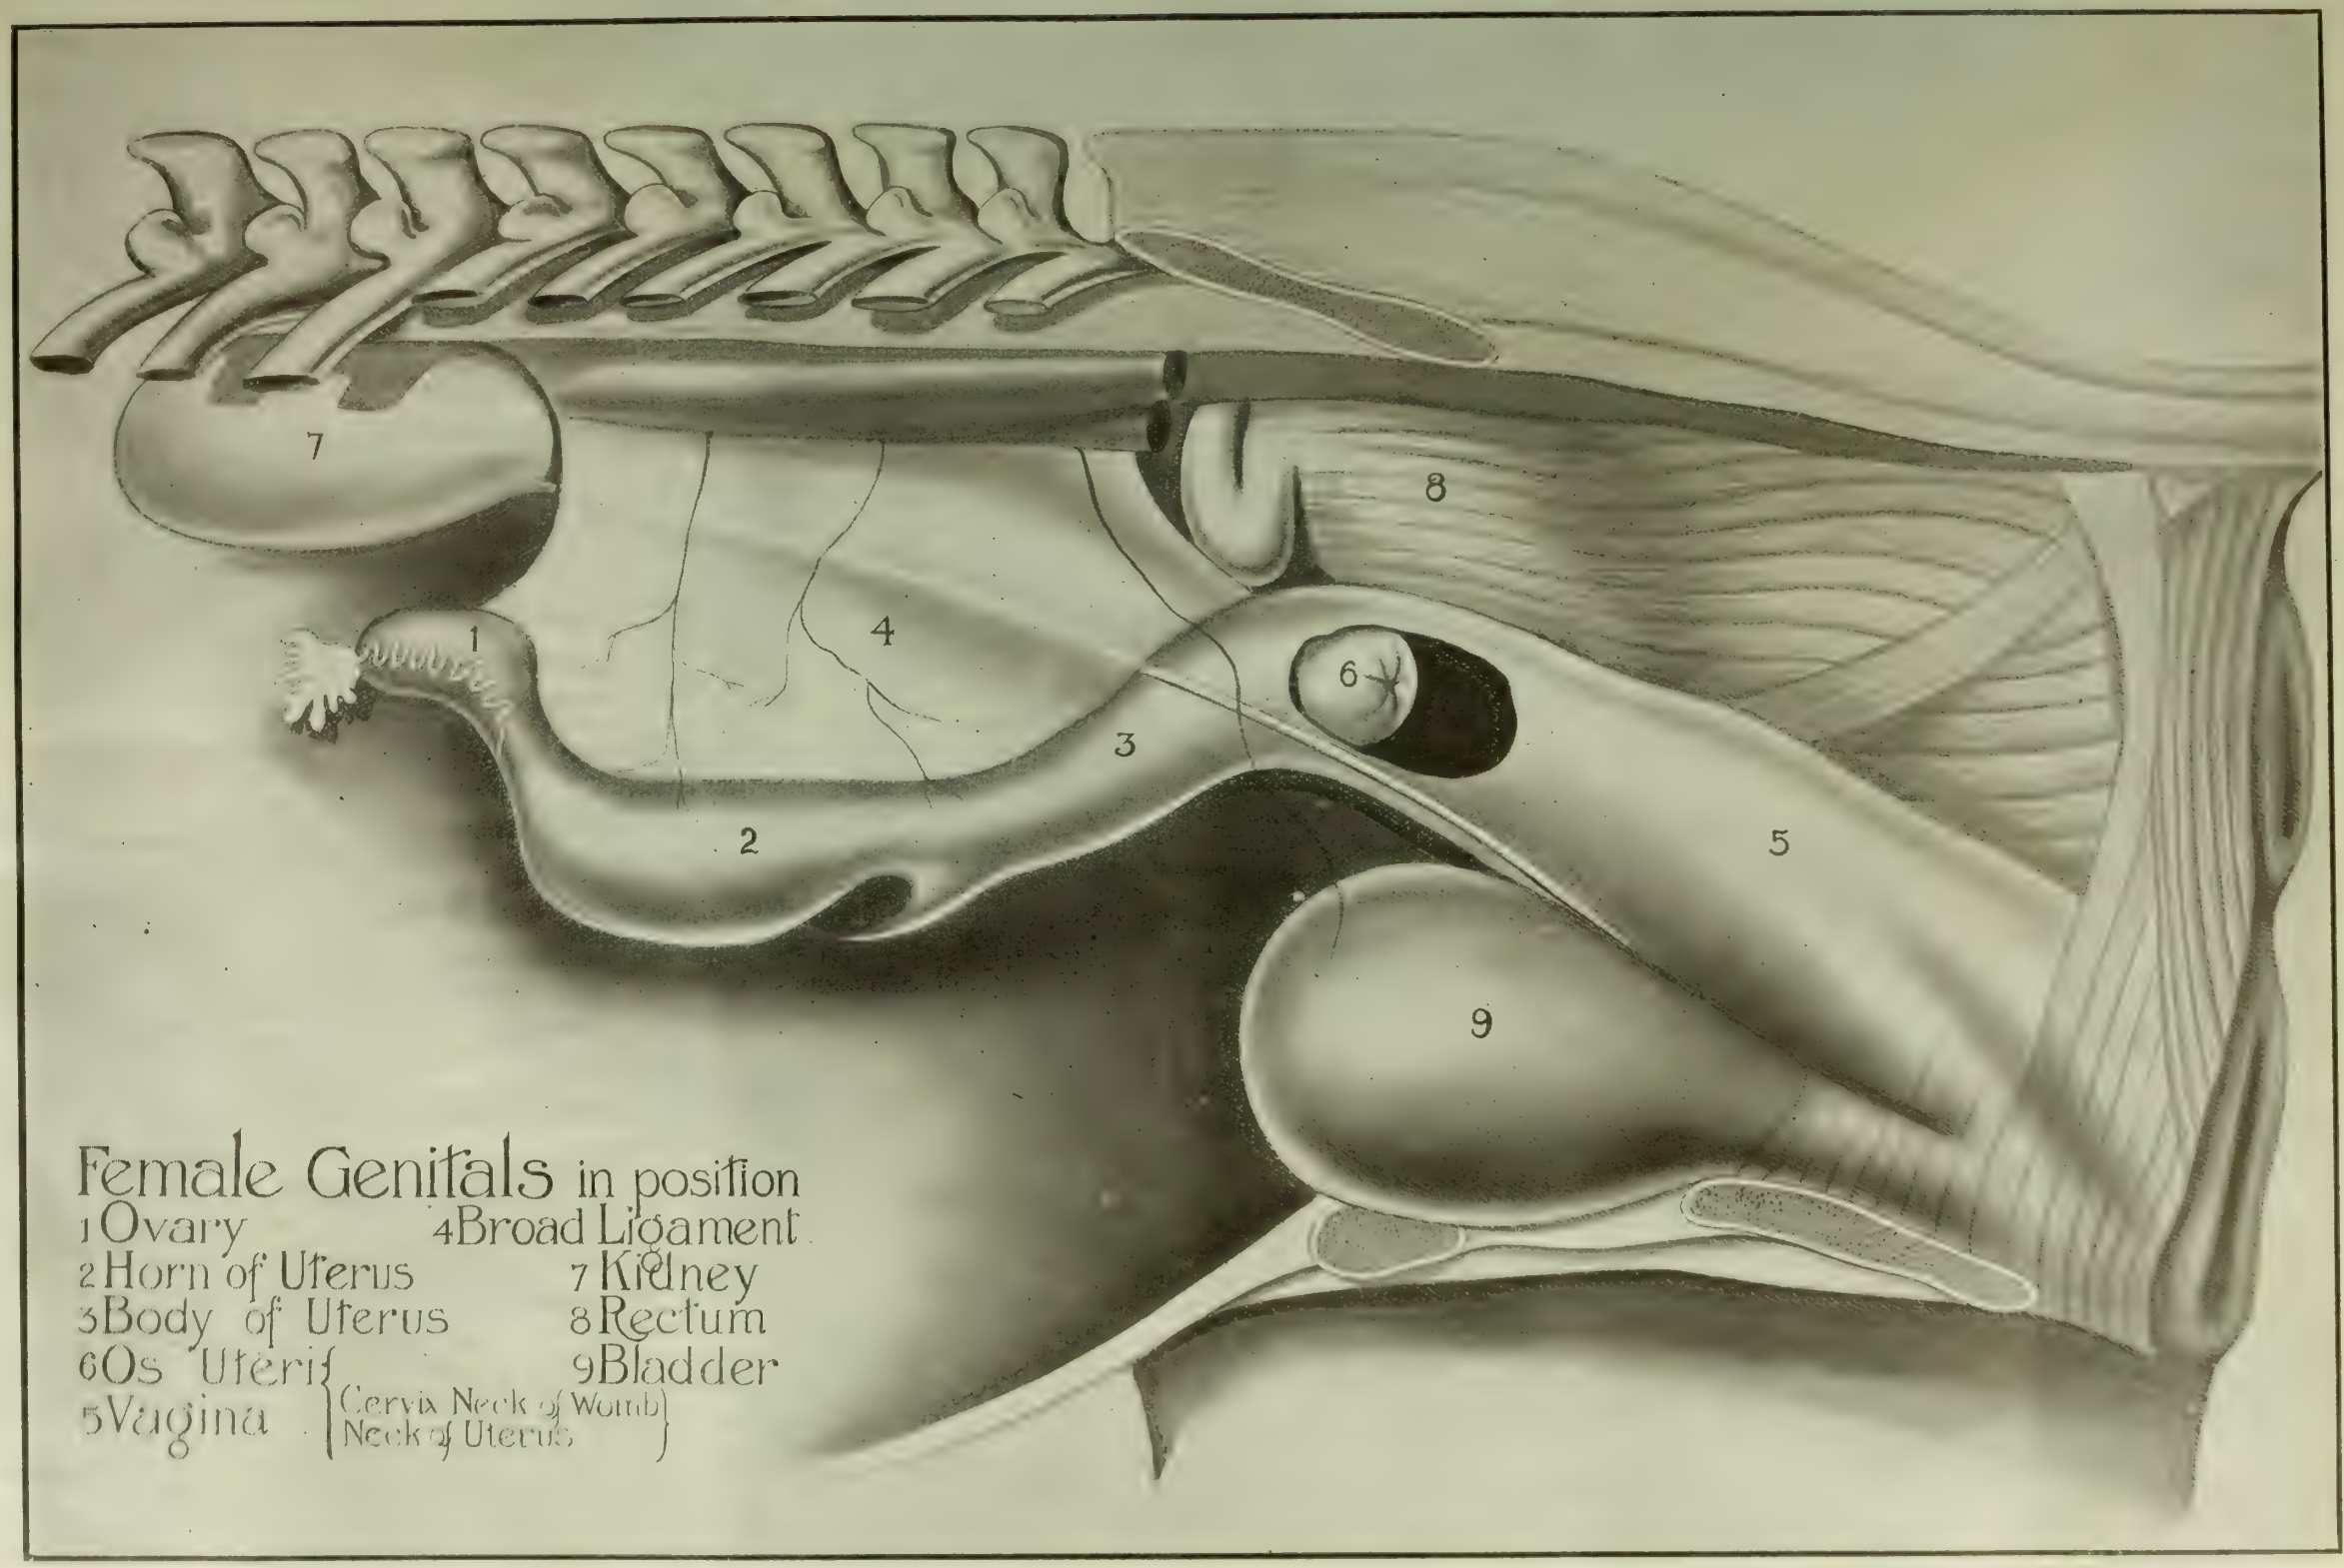
A Texas reader states that he has been successful with the capsule system for two years, but his territory is scattered and he asks whether it would be possible to carry the semen 15 or 20 miles sucessfully.

We would advise all new breeders not to attempt anything of this kind, but to breed only the mares present at the time the service is made, and do it quickly. All new breeders must establish themselves first as capsule breeders. There are a lot of breeders who would like to do something that is nearly impossible for new men. Our advice is to go slow, and learn how to do these things, and do them right, without taking any great chances. When a mare is bred and she fails to settle, the owner of the stallion or jack will be blamed for not being able to produce a living colt, no matter what methods are employed.

If our Texas reader has established himself as a competent capsule breeder he can get a black, thick bottle, sterilize it with a creso dip, and wash it out with water as hot as the bottle will stand, then leave the cork out for several hours to let the antiseptic lose its strength. The bottle should have a glass stopper, as a cork stopper is nearly impossible to sterilize. The semen extractor should be scalded before using, and the bottle should be of the proper temperature when it is filled with semen. It should be carried under the arm of the breeder, so as to maintain the right temperature. After the destination is reached the capsules should be filled and inserted into the breeding mares, and just as much care should be taken in washing the hands when going from one mare to another as would be taken at the beginning or close. We would not advise any breeder to try this extensively the first season. Some men can do it successfully, and others will be failures. It is better to found the business on a conservative substantial basis than to take any chances.

BREEDING TERMS.

I am manager of and stockholder in a company that owns a pure bred Percheron stallion. Our breeding terms seem to be unsatisfactory to some mare owners, and to two members of the company. Here are the terms under which we have been breeding:



"Fifteen dollars to insure colt to stand and suck. If mare is sold, traded or removed from the county fee becomes due and must be paid."

A few days ago, I collected for two colts, the mares being sold at auction, of course, before they dropped colts. The dissatisfied ones say this isn't right. Some say the man who owned the mare at the time she was bred does not get anything for his money, while others say that the man who buys the mare loses too much in case she does not drop a colt. I suggested the following terms. What do you think of them?

"Insure a colt to stand and suck. If a mare is sold, traded or removed from the county, service fee becomes due, and must be paid, but if the mare when sold, etc., does not bring a colt, when her time has expired, the man then owning her may have service of stallion that season without charge."

I want to make terms to satisfy everybody, and at the same time make the company safe. I believe this question will interest a good many men who are standing stallions.—Charlie Jordan, Wabaunsee county, Kansas.

Here is an important question, not only to stallion owners, but to every man who owns a mare, and we should like to print several answers from both classes to Mr. Jordan's question. In answering, the writer should give an idea of the local conditions to which the terms he recommends will be adapted.—Editor.

Female Genitals in position

1 Ovary

8 Rectum
9 Bladder

QUESTIONS
AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, makin git safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

COLLECTING SERVICE FEE—Can I collect the service fee where the mare slipped her colt five months before time? Service fee being $15.00 to insure a standing colt.—Minnesota Subscriber.

REPLY—Under the terms of the contract you cannot collect for the colt, until the contract is compelted—colt to stand.

MARE WAS KILLED—Last year I bred a mare for a man, service fee being $15.00 to insure a standing colt. A short time ago the mare was cut with wire so she had to be killed. She was in foal. Can I collect the $15.00 horse service fee lawfully?—Minnesota Subscriber.

REPLY—You cannot collect for the colt in this case.

SEPARATING YOUNG JACKS—At what age should young jacks be separated from each other?—New Mexico Subscriber.

REPLY—It is usually better to separate young jacks at the age of from 12 to 15 months, as they are liable to get rough with each other, and should there be a weak one in the herd he might be damaged. Usually they are more easily broken when they are separated at this age.

RAISING HINNIES—Is raising hinnies from burros and a stallion a success?—New Mexico Subscriber.

REPLY—If you will select jennets with colts by their sides, or jennets in foal, so you are positive that they are breeders, they can be bred to a stallion with the capsule system successfully, providing they are kept away from jacks, mules and horses. These jennets should not be kept in a large herd together in a small inclosure. If they are allowed plenty of freedom they will do much better. Burros raised on the plains will do fairly well in a large herd if they have been raised that way.

MARE ABORTED—I am very much interested in the barren mare subject. I have a mare coming seven years old that raised two colts and has failed the last two years. She was bred April 30, 1910, and never was caught in heat again until August 22d, then bred, and came around again in the latter part of October and not bred again until March 21, 1911, then again April 24th and tried regularly until July, and she was not noticed in heat until December. Now I should think if she carried her foal that long there would be some sign of it. I measured and weighed her once a month and she never varied in measurements, and very little in weight. I would give $100.00 if she could be gotten to produce a living foal.—Minnesota Subscriber.

REPLY—Your mare has probably been losing her colts. It is not necessary that she show any signs after aborting after such short periods. The fetus does not increase in size sufficiently to be noticeable by weight or measurement, and it is easily expelled. A little blood on the tail might be noticed if the mare was watched daily. We would suggest that you use the barren mare treatment given in this issue, and breed her after she has had a couple of weeks on grass. If you do not need this mare to work, turn her out and give her plenty of freedom during the fall and winter months. Arrange for her to run out of doors all winter if possible, with plenty of feed, and a shed to run under during bad weather.

DIAGNOSING PREGNANCY—I would like to know how to tell when a jennet is in foal. How early can it be told? I have a jennet that is half gone, and she has either lost her foal or failed to get in foal. I thought she was in foal, but could not see any motion. I have fed her black haw for four months.—Nebraska Subscriber.

REPLY—The jennet is probably in foal, or at least she certainly has not come in heat. It is usually very easy to tell when a jennet is in heat, if she can see a jack or a mule, as the ears will be back on her neck, and her mouth wide open. Give your jennet plenty of freedom, and get her on good pasture as soon as possible.

RANK SERVER—I have a three year old Percheron stallion, weighing 2,150. In serving a mare he seems to be anxious and will enter and then just lay on her. I take him off and lead him around a few minutes and bring him back and he will give her a good cover. The horse is fed bran and oats ground, and a little corn and hay. He has a large paddock to run in. I feed him about all he wants.—Indiana Subscriber.

REPLY—After the season starts this stallion will probably get over this trouble. He is very rank. If you could use another stallion for a teaser it would be better for him, or if he had more exercise he would serve better. The next mare you serve to him do not put her head and breast against anything, but let him mount, then let the mare take a few steps, as though she might get away, providing the mare is large enough to hold him. This usually gives good results, with young, rank stallions.

LONG PENIS—My jack has a very long penis. I think he would be more sure to collar his penis. I breed the old way—the natural service.—Missouri Subscriber.

REPLY—After your jack has made the entrance, put your hand on top of the penis between the jack and the mare, and hold the jack's bridle rein in such a way that he cannot go any further forward, but be very gentle with him, as there is danger of spoiling him. After you have made a few services this way, he will get accustomed to this arrangement, and you can hold him back a few inches. Do not have the jack too high. A few inches lower than the mare would not be objectionable.

STALLION AND BREEDERS' BAG—I have an imported Percheron stallion, 12 years old. He is in fine condition and weighs 2,200 pounds. He will get ready quick, get on, enter, back in and out for four or five times, and finally get off without serving. I have been standing stallions for some time, but have never seen a horse act like this one. I have owned him two months and he has served one mare and failed on two. Please print your answer, as it might benefit someone else also.—Indiana Subscriber.

REPLY—Someone has probably tried to force this stallion to serve in a breeder's bag, and you may have considerable difficulty with him, but if he has not been spoiled too completely he may get better after the season progresses. He will probably fool you on many occasions by not discharging any semen. He may wear himself out, and you may think he has discharged. You will need a microscope to make a test occasionally. It would be better to test the semen at each service with this stallion for a while. After you have made a dozen services with this stallion write us again.

ABORTIONS IN MARES—Why are there so many abortions among mares this winter and spring? The most of them around here are between seven and nine months gestation?—Illinois Subscriber.

REPLY—It is difficult to explain why you are having so many abortions in your locality. The extreme weather conditions have been very unfavorable and the feed has been bad in many localities. The serious conditions are usually in small sections, just why this is, we do not know. One section may have a fairly good colt crop, and in another neighborhood practically all the mares will be dry this year.

OPENING MARES—If a mare fails to breed for over two years, is it best to open her up before breeding? If so, how large should the mouth of the womb be to be normal?—Missouri Subscriber.

REPLY—The mouth of the womb should be open just large enough to insert a capsule, and all such mares should be bred with a capsule. This is the only way to get a complete service. The cervix may be opened up before the service is made, and close before the service is completed. The hand should always be washed with soap and water, and rinsed in clean water before being inserted into a mare.

WASH FOR ABORTING MARES—We have lost a good many colts from mares aborting this winter, and would like to have you prescribe a good preparation for flushing out the mares. What are the best articles to use for flushing out the mares. I intend to breed the mares again this season.—North Dakota Subscriber.

REPLY—Use the treatment for barren mares given in this issue. The iodine is a good disinfectant and will serve your purpose. Do not use any other disinfectants in the generative organs.

MARCH 5TH ISSUE—I am a new beginner in the stallion business, and would like to give my patrons a paper as a sample copy. Could you furnish me with 75 or 100 copies of March 5th (No. 4) issue, and if so, what can you furnish them for?—Ohio Subscriber.

REPLY—We cannot supply any of the back numbers in quantities such as you name. The March 5 issue contained 92,000 papers, but we haven't any left. You should arrange to send the mare owner's editions next fall when they are advertised in their regular order.

STALLION SERVICES—I have a Percheron stallion that will be three years old May 30th. He weighs 1,875 pounds. I bred him to 20 mares last year and got 18 foals. How many mares should be bred to him this season? How much time should elapse between services? Would one service a day be too much, or could he stand more than one a day, and if so, how often would be safe?—Iowa Subscriber.

REPLY—You made too many services last year. Three services a week for this stallion, under existing circumstances, no two services closer than 24 hours, will secure the best results. Ten services for a two-year-old stallion is usually sufficient, with no two services closer than from five to eight days.

DISINFECTANTS FOR MARES—What is a good disinfectant to use on mares before breeding, and how do you use it? I hear it is a fine thing.—Oklahoma Subscriber.

REPLY—Follow the directions for treating barren mares given in this issue. Do not use any disinfectants other than we have prescribed in that article.

EVERY OTHER YEAR—I have a brood mare that will not breed only every other year. She will always take the horse on her day. Year before last I bred her three times and she never got in foal. She is going to drop me a colt this spring, and I would like to know a pretty sure way to get her to breeding every year.—Illinois Subscriber.

REPLY—Breed this mare with a capsule on the seventh day after the colt is born. Have your stallion owner examine the semen with a microscope so you may know that the semen contains live spermatozoa. Your mare is probably a heavy milker, and her vitality is expended in the milk flow to the extent that the generative organs do not perform their regular functions. The first ova after parturition is usually matured, but if she is not fertilized at the first opportunity, other heat periods may not develop a live ova.

EXERCISING A JACK—I have just bought a jack and will stand him this season. I feed him two ears of corn each meal, and what hay he will clean up, and for exercise he has a lot to run in. Besides that I ride him every few days. Do you think it would be a good idea to drive him to the wagon for a little more exercise? Some tell me it would be best, as it would give more strength and vitality to his breeding and colts, and would make him more sure.—Illinois Subscriber.

REPLY—If you will fence two acres jack tight for your jack, he will probably get all the exercise he needs. The exercise should be given every day instead of using every few days. Change the feed to oats and give him a little more grain. It is not advisable to work a jack unless you drive him single.

TRAINING YOUNG JACKS—I have a young jack, seven months old, and I want to know how to train him. Want to know how long to pasture him before I take him up, and what to pasture him with.—Alabama Subscriber.

REPLY—The jack should be weaned and taken entirely away from all jennets and mules. He should be placed in a good pasture with a mare colt that he is not afraid of. They should remain together until the jack is 15 or 18 months of age, unless the jack should get too rough, then the jack should be kept separate. Feed him nutritious feed, which should consist of oats and bran in equal parts by measurement, about all he will eat. Arrange to have green stuff for him as much of the time as possible. Keep him growing rapidly. When he is 25 or 30 months old, let him make a service on a small, gentle mare, that is in good heat, and be sure that she will not squeal or kick, as the first service is the one he will remember for a long time. Be careful that he does not learn any bad habits at this particular time. After he is five years old and thoroughly broken to serve mares, a few jennets may be served after the breeding season is over for that year.

SLOW JACK—I have a slow jack. About the only way I can get him to work is to use jennets, and it don't seem like he can get ready right away, still he seems to try to get ready. Is there anything I can do for him, or anything I can give him, so that he will work better? He is a fine jack, and gets good colts.—Texas Subscriber.

REPLY—If you have teased a mare, and know that one is to be bred, go in and put the bridle on the jack, but do not bring him out until you have put the mare in the pit and made such other preliminaries as are necessary before breeding. It might be a good plan to lead the jack out and tie him where he can see all the performance. This gives him time to think the matter over, and you can have other things that you can be attending to, so as to give him plenty of time. If this does not work, have

THE BEST ARGUMENT YET

Since presenting (on the front cover of our issue of March 20) a graphic demonstration of the money making importance of breeding to only good, pure bred sires, we have received a great many letters like the following:

To The American Breeder: The illustration on the first page of The American Breeder, March 20, is the best argument yet. Will you get me a half or fourth size cut of same, so that I can use it in connection with my stallion advertising and give American Breeder credit for it. Please send bill for cut if you allow me to use it. R. R. Pittis, Scio, Harrison County, Ohio.

In order to accommodate this demand we have had a number of cuts made from this cover illustration, all the same size and specially designed for use in local papers. We have made them the width of two ordinary newspaper columns and will furnish them at cost ($2 each), paying the postage ourselves, to any who wish to use them in connection, with the information we printed under the original picture, and who will see that The American Breeder is given credit when the cut and reading matter is printed.

a jennet where he can see her from quite a distance. There are some jacks that require time to get ready, no matter what the conditions are. If he does not get ready quickly with this method, then you may chew a piece of ginger root the size of the end of your little finger. Chew it until it gets hot, then insert it into his rectum. This will wake him up, and has had good results on some jacks, usually the sleepy kind.

TAKING STALLION TO IOWA—I have a stallion which I had examined in Kansas, and have his certificate. I have moved him to Iowa, and now do I have to have him examined again?

REPLY—It will be necessary for you to have your stallion examined again, according to the Iowa law.

PERCHERON AND FRENCH DRAFT—What is the difference in a French draft horse and a Percheron horse?—Iowa Subscriber.

REPLY—The Franch draft association recognizes only the recognized draft horses from France. The Percherons, Boulonnais and Nivernaise are all that are imported to this country to any extent. The two Percheron associations in this country recognize only horses registered in the Percheron stud-book of France.

LICENSE FOR STALLIONS AND JACKS—Does a man have to pay a license to stand a horse or jack?—Iowa Subscriber.

REPLY—The Iowa state law requires you to have a license to stand a stallion or jack, for public service.

STRENGTH OF SPERMATOZOA—Will the spermatozoa (germ) of a horse be weaker late in the season and produce a weaker colt if he is used hard through the season than it is in the spring before he is used much? For instance, strong grain of corn—a strong, healthy ear. A weak grain of corn—a weak, sickly ear. Does a strong spermatozoa (germ) produce a strong colt, and a weak spermatozoa germ produce a weak colt, providing conception takes place in both instances?—Kansas Subscriber.

REPLY—Stallions used excessively make many worthless services because the semen does not contain live spermatozoa at every service. Mares fertilize better, and the colts have more vitality and a smaller per cent of them die during the first few weeks of their life, from stallions which are not used to excess.

MISSOURI STALLION LAW—I found a colt, coming two years old in the spring that I have not got my stallion fees for yet. I did not know that the mare had a colt, as the owner always lied to me, saying the mare did not find a colt. I found out about it two weeks ago. What can I do to get my money?—Missouri Subscriber.

REPLY—Go to the nearest justice of the peace and make a claim covering the colt, in this case for the cost of service fee,' which is similar to the feed bill lien in your state.

RETURNING MARES—In breeding a mare how many days after she finds a colt, do you breed her, and how many days after that till you breed her again?—Alabama Subscriber.

REPLY—Mares may be bred any time after the 6th day after foaling, providing the mare has cleaned properly. The 21st day after the mare has been bred is the proper time to retry her.

CLINICAL THERMOMETER—I have purchased a thermometer for taking the temperature of horses, and I thought it was of no account, but probably I do not know how to use it. Will you tell me how to use it?—North Dakota Subscriber.

REPLY—The clinical thermometer registers up to a certain point and remains there. It does not go up and down according to temperature like a hot water thermometer. In order to get it down it must be shaken down with a swinging movement of the air before it will recede. It will require about one minute for the average clinical thermometer to take the correct temperature.

The phosphates are abundant in our country for all possible uses. Florida, Kentucky, Tennessee and Idaho may be mentioned as depositories.—From the 1911 report of the United States Secretary of Agriculture.

Treatment for Barren Mares

A Safe Course That is Advisable, This Season in Particular, for All Mares That Have Missed Bringing Colts. Some Troubles the Treatment Cannot Remedy.

By Frank B. Graham, Editor.

There are a lot of mares that need, at this season, especial care and treatment; more this year than usual. The extremely hot and dry weather last summer, the severe cold winter, scarcity of feed and the late spring, will result in starting many mares into the breeding season thin in flesh and very soft, which will be a serious hindrance to breeding operations in many localities.

Heretofore we have advocated that if a mare refuses to settle to the service of a fertile stallion or jack, she should be treated, but there have been so many abortions, as a result of the extreme conditions, that we believe it would be a good plan to give every mare some treatment, if she was bred last year and is not now in foal, or if she has not had a colt.

The iodine, saline and soda treatment has given excellent results, but we do not think it will be necessary to give this treatment as often as we directed last year. The iodine treatment should first be given, the saline solution should be given two weeks later, and the soda treatment may be given with, o rsoon after the saline solution has been used. Then the mare is ready to breed. This treatment will not cure all cases, but it will help to put a lot of mares in breeding condition. Some of them, however, may not fertilize for several weeks—or possibly months—after treatment has been given.

The first thing necessary, in equipment for giving this treatment is a container made of galvanized iron holding three or more gallons of water. It should have a spout soldered on at the bottom, and this spout should have a cut-off valve in it. About eight feet of hose three-eighths of an inch in diameter should be slipped on the spout of the container. With this appliance one can get most any pressure wanted by elevating the container.

When the fluid is to be injected into the uterus, one should always be careful not to inject any air into that organ. This caution is especially necessary soon after a mare has foaled or aborted, as neglect of it might result very seriously. After the uterus has been filled with fluid, close the cut-off valve in the container, slip the end off of its spout, and lower it so that the fluid will again siphon out of the uterus. Slip the finger into the uterus and over the end of the hose to prevent the membranes from clogging the suction, the same as is done when the semen is being taken from the uterus with the extractor.

A tinner can make the container, and any druggist can get the rubber hose. An oil stove might be used for heating the water. Every breeder should have some means of heating water for breeding purposes.

The operator should have a good supply of good soap and clean towels, and a means of boiling water. All water used in this connection should be sterilized by boiling. Do not use any strong antiseptic. The hand should always be washed thoroughly with soap and later immersed in sterilized water before it is inserted in the mare. All water used in the flushing process should be sterilized. All instruments of any kind should also be sterilized. No one can expect to have satisfactory results, either in breeding or treating mares, without being absolutely clean.

For the average shy breeding mare, not having a bad smelling discharge, we would begin with a weak solution of the iodine treatment—and a table spoonful of iodine to a gallon of sterilized water is sufficiently strong—or just strong enough to give it a bright red or port wine appearance. Irrigate the uterus and vagina with this solution at a temperature of 105 degrees Fahrenheit. Then in two weeks follow with the salt solution, which is composed of a teaspoonful of clean table salt to each quart of water, boiled together about 10 minutes. This solution should also be introduced at a temperature of 105 degrees. The container should be full for each mare, so that there will be enough left at each irrigation, leaving the hose full, so that it may be siphoned out. The uterine cavity is larger in some mares than in others.

No fluids should ever be injected into the uterus or vagina at a temperature less than 100 degrees. The best temperature is 100 degrees. The liquid should be that hot as it passes out of the hose. To insure having the fluid at this temperature, it must be remembered that it is likely to cool in passing from the container into the hose. To overcome this, let the fluid pass over the hand, determining its heat at the same time. After making sure quickly that the fluid is passing out of the hose at the proper temperature—about 105 degrees—insert it into the mare. In permitting a little of the liquid to pass over the hand to determine its temperature, all the air in the hose will be driven out, eliminating all possibility of forcing any air into the uterus.

It must oe remembered that in the above treatment the heat is an important factor, inasmuch as it invigorates and stimulates the sluggish and inactive tissues, and excites them to repair. The salt has a most salutary effect, promoting the circulation of the fluids through the parts.

The soda treatment consists of a teaspoonful of bi-carbonate of soda, added to the saline (salt) solution, to further neutralize the acidity, or the bi-carbonate of soda may be used separately in sterilized water.

Treating these mares will afford an opportunity for postponing the breeding for several weeks, which in most cases is a good thing to do. Most of the mares that work will be crowded into the season rapidly without much preparation, and their general system will be deranged. They will frequently have colds and a general catarrhal condition, that may be greatly improved after weather conditions become more settled and they are more accustomed to work.

If a capable veterinarian can be employed by the mare owners to treat these mares, it will relieve the breeders of a great deal of work, for which they can never expect to collect any money. But if the mare owners will not pay for this work, someone should do it, as there are too many shy breeding mares that will require some relief before they will ever breed. The average stallion owner, who will pay particular attention to his work, should give this treatment without much difficulty. There is very little danger connected with it.

Last year we published a series of articles on barren mares, which, though reliable and all right, may have been too technical—at least only a small per cent of the breeders tried the treatment.

There are a lot of mares that are in a healthy condition, which do not fertilize, even after the above treatment, but the treatment will not be injurious to them. The mares having a closed cervix, so that the spermatozoa cannot enter, will never fertilize without help. There are a lot of 9-day mares that do not get in foal. There are some mares that have had difficulty at a previous foaling time, which has lacerated the cervix to some extent. All these mares can be greatly helped by using capsules. Mares having 9-day colts should not be teased for the best results. Breed them with a capsule, whether they are in heat or not.

STALLION AND JACK INSURANCE.

To The American Breeder: In the "Breeder" of March 5th, we notice what we would call some very sound logic, under the caption of "Health of Stallions," and on the same lines I want to add a few points, together with some facts that have come under my observation. I heartily endorse the idea of using the insurance premium for improving conditions, for handling and caring for the stallion or jack, and think it will yield much better returns than when turned into the coffers of some "greedy corporation," who pretend to offer protection.

I am not intimate with draft horse conditions, temperaments, characteristics, etc., but in 22 years' actual experience in handling stallions of saddle breeding and a few trotters, along with jacks, and a much longer observation of them, I have never known but one or two stallions and no jacks at all, to die between the ages of 10 and 20 years. In fact, we consider an aged stallion or jack almost immune from the ordinary ailments that affect the average horse, and with the proper precautions, and good care and attention (that they should have anyway), we think the danger from death can be brought to a very insignificant matter, with the younger class. I would rather go out and pay my neighbor breeder for a new stallion occasionally than to pay the price of one every few years to some insurance company.

And now to the most objectionable feature of the insurance company's business. They go ahead and issue you a policy for say $500.00, collect premium on $500.00, or $50.00, for this policy, and at the end of the year will repeat the transaction, if the subject will allow, and will so continue indefinitely if permitted. But suppose the animal dies; such a howl as will penetrate the atmosphere, followed by all kinds of propositions for settlement—we will pay so and so, and so and so, and perhaps $320.00 on a $500.00 policy. I use these figures because they are actual ones now in an attempted settlement of one instance just under my notice.

Now, Mr. Stallion or Jack Owner, this is not right. It is in no wise fair, and this particular case is what prompted these lines in the hope they may be a means of saving some fellow owner a few hard earned dollars. I do not know that all companies do these things, but some of them surely do, and I could give names and dates if necessary. And judging from the attempted settlements of various other insurance companies in my state, I am presuming this to be the customary rule. I would advise no compromise at all in any such settlement. You have paid your money for protection and are entitled to it. The insurance company agrees to protect and should be made to fulfill this agreement or shut up shop. Demand face value for your policy and collect it, or shut the doors of the company who refuse to pay it. A Kentucky Breeder.

When a foreign insect invades, our scientists seek its enemy where it came from. The natural enemy of the boll weevil was an ant that could not endure our winters, but the native ant is getting busy.—From the 1911 report of the United States Secretary of Agriculture.

The consumer pays a dollar for food; the farmer gets less than fifty cents for it. Who gets the rest?—From the 1911 report of the United States Secretary of Agriculture

THE AMERICAN BREEDER

With which is combined
THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE Editors.

Published semi-monthly (on the 5th and 20th of each month) by the
GRAHAM PUBLISHING COMPANY, INCORPORATED.
225 WEST TWELFTH STREET.
Kansas City, Mo.
BELL TELEPHONE, 4297 GRAND.

All communications for this paper should be addressed to the American Breeder, or the Graham Publishing Company, and not to individuals.

Advertising space for a single issue, $2.80 for an inch or less. For larger space or longer time, rates furnished on application.

Subscription Rates.

To all points in the United States and Mexico, per annum, 50c; 3 years, $1, payable in advance.

To all points in Canada, per annum, in advance, 75c.

To all foreign points (in the International Postal Union), per annum, in advance (6 francs, 5 shillings), or $1.15.

When sending subscriptions, please state whether they are renewals or new ones. Always renew under the same name and initials as previously used, and at least two weeks before your present subscription expires, so that you will not miss any number. When changing your postoffice address, state the old address as well as the new one.

Watch the wrappers on your paper. The month before your subscription expires they are stamped "your subscription expires with next issue," and on the following edition is stamped "your subscription expires with this issue." When the time for which the AMERICAN BREEDER is ordered has expired, it is always discontinued.

If you miss your paper please notify us at once and all lost copies will be replaced.

Entered as second class matter, November 23, 1911, at the postoffice at Kansas City, Mo., under the act of March 3, 1879.

Copyright, 1912, by the Graham Publishing Co.

All persons are warned not to reprint any part of this paper during 1912, without giving full credit for the same to the American Breeder, Kansas City, Mo.

CAPSULE BREEDING.

Those who have had years of experience in standing stallions and jacks for public service have met with many disappointments in collecting enough revenue to maintain a high class sire. It was this difficulty that caused the editor to investigate every known method of artificial insemination. He has personally tried every instrument and appliance known to be used in such operations, and many of them have been costly. He has traveled far and wide to see the results of individuals who claimed success with some particular method.

G. L. Carlson has produced the best method of artificial insemination up to date. The writer went to his place and investigated the number of live colts and the per cent of foals. He found that Mr. Carlson had been securing over 200 colts a year with one stallion, and in 1910 his stallion, Nicholas, produced about 250 colts. This is one of the reasons we advocate the capsule system and the Carlson Semen Extractor. Another reason is that a number of breeders this year will have about 200 colts per stallion, and the necessary information concerning the success of this method is so plain that any average man should, with the same experience and care, be able to secure equal results.

It is not our purpose to proclaim the failures of men, but to show where an improvement can be made. Our efforts in boosting the modern methods of horse breeding have made us numerous enemies. Those who do not own a stallion or jack good enough to attract the patronage of more mares than can be served with the natural service do not want the modern methods to be practiced. They well know that it will only be a few years until many inferior sires will be castrated They have no use for the modern methods. There is another class who are afraid that the demand for stallions will be curtailed through this practice, and may interfere with the sale of stallions. If those dealers handle scrubs they have a right to be alarmed, but the modern methods of breeding will create a greater demand for the good ones, and every reputable dealer will find a ready market for good stallions or jacks. As soon as the American breeders find that maintaining a really valuable sire for public service is extremely profitable, more education and money will be used in horse breeding.

GETTING THE SEMEN.

There is only one practical way of getting the semen for artificial breeding; that is with the Carlson Semen Extractor. There are dozens of different plans, and instruments and appliances, for getting the semen, but nothing should be used in the way of a breeder's bag to obtain the semen. Too many valuable stallions are ruined every year through the use of these appliances, which are made for sale, and not to be used successfully. A few men have had difficulty in getting the semen out of the uterus with the Carlson Semen Extractor. They have not been able to keep the membranes from clogging in the suction. Much experimenting has been done to make a protector for the soft, metalic point that enters the uterus, and one has finally been found successful. It is very simple in its arrangement, but it is a success. With this point protector on the Carlson Semen Extractor any school boy that will study the charts of the female organs in this issue, should be able to get the semen out of the uterus with the Carlson Semen Extractor. The membranes cannot clog the point of the extractor with this new arrangement. The point of the extractor is inserted into the uterus with one finger over the point. Only the front finger and the point of the extractor goes through the neck of the uterus, then the point is bent down to the bottom of the uterus, and the point is pushed down so as to make a basin or a depression where the semen can accumulate around the point of the extractor. The point should be held in that position for a little while in order to allow the semen to flow into the basin. Semen will not flow as rapidly as water. After the semen has collected around the point of the extractor, the piston is drawn out with the hand outside of the mare. The thumb is pressed against the barrel and the finger clamps the piston rod in order to pull the suction out. The hand outside of the mare should not pull against the hand inside of the mare, as the hand in the mare should be free to keep the membranes away from the point of the extractor in case the point protector is not used. This new point protector is put on the point with a screw. The cap can be screwed up so as to make a valve, and after the semen has been extracted the valve may be shut up, so it can be placed in water without the semen and the water being mixed. The new point protector can be purchased from the Kansas City Impregnator Company, whose advertisement appears in this issue.

There are still a few men—some of them veterinarians—who have read the old text books that claim stallions and jacks make the discharge in the vagina. With a good serving stallion the principal part of the semen will be found in the uterus on breeding mares in nine times out of ten. The writer made public breeding demonstrations in ten states last year, and in every case the semen was obtained from the uterus. Of course, breeding mares were selected to make the natural service on, and as it happened the stallions which discharge in the vagina are not as sure as those which discharge into the uterus. The semen obtained from the uterus is more fertile than that taken from the vagina, or that withdrawn by the stallion. There is less dirt in the semen which is injected directly into the uterus by the stallion or jack and neither does it come in contact with urine.

THE MEAT PRODUCER'S INNING.

Abundant proof of a character not to be doubted has been offered to show the enormous decrease in the number of beef producing cattle this country contains. Our beef supply, instead of keeping pace with the increase in population, which in the last ten years has amounted to nearly 22 per cent, has fallen off nearly 7 per cent, so that, population and weight of beeves considered, we have now only about three-fourths as much available beef per capita as we had ten years ago. For nine years of the past dozen the receipts at our principal markets did not reflect the real extent of this decline. The successive closing out of big range herds more than made up for the decrease in shipments caused by the cessation of breeding operations on many farms in the corn belt.

Finally, however, a point was reached where the continued depletion of range herds made itself felt in a marked fashion at our central markets. In 1910, for instance, with more than usually favorable conditions for feeding, and with prices of prime beeves and butcher cattle fairly well sustained, receipts at Kansas City decreased over 150,000. The year 1911 opened with cattle feeders in possession of knowledge which made good beef prices more certain than they had been for years, and of course no hint of the drouth, which finally made cattle shipments much heavier than they otherwise would have been. But in spite of both these factors favoring an increased marketing of cattle at these points, another decline was reached almost as large as for the year previous, cattle receipts going down to 2,368,000, or the lowest in seven years.

A business as enormous and widespread as that of cattle breeding and feeding in the United States must necessarily change very slowly. A great many who are interested have overlooked this fact, and have doubted the statements as to shortage which have been published repeatedly and usually upon good authority. Just as many have been slow to realize the approach of this shortage and what it means, there are comparatively few taking the steps to check it and to benefit from the conditions which this shortage most certainly will soon create.

This year offers no promise of relief in the production of beef, or other meats to take its place. Cholera, and the resultant enormous runs and light weights and half-fat hogs, have stripped the country of porkers without giving us any pork reserve. In the sheep business, 1911 was sufficiently unsatisfactory to make certain a general curtailment of operations in 1912. And even in poultry it is apparent that 1912 will not be able to show complete recovery from last year's comparatively light production. Low prices and unfavorable weather in 1911 had the effect of cooling a poultry enthusiasm, which in 1910 amounted to almost a boom, and now, even with prices more encouraging than for a year, it is hardly possible to stimulate production to the level of a year ago.

Following the publication, a few issues since, of an editorial on the much talked of Brazilian cattle raising project, we received a great many inquiries for the address of Murdo McKenzie, who has been employed to manage this gigantic enterprise. Mr. McKenzie is now on the job and his address is Sao Paulo, Brazil, in care of the Brazil Land, Cattle & Packing Company.

PARTIALLY PERSONAL

A letter from A. M. Caldwell, written at his home in Champaign, Ill., tells of his gradual recovery from serious injuries received in a railroad wreck.

W. J. Hackney of Oakland, Ky., is reported as selling the saddle bred stallion, A Kentucky Colonel 4041, for $2,500. The buyer is H. O. Hurley of Louisville, Ky.

Two Missouri breeders, E. M. Hall of Carthage and J. W. McDermott of Kahoka, have been selected to judge Shorthorn cattle at the next Shreveport, La., stock show.

One "farm paper" charges $5 for a life subscription. As it circulates in a healthy section subscribers of naturally great longevity are expected to get their money's worth.

John W. Groves, who has been secretary of the American Shorthorn Breeders' Association for eleven years, making an excellent record for efficiency, died at his home in Chicago, April 2.

As near as the Average Mind can gather, from the course and conclusion of the recent packers' trial, the packers did the things with which they were charged, all right, but were not guilty.

A Duroc Jersey boar called Defender, is reported as sold for $5,000 to E. S. Mayes of Springfield, Ky. East Bros. of Lima, O., are the gentlemen who made the sacrifice of giving up the boar.

The proposed law for government regulation of live stock records was reported at length (about this length —) by the "leading live stock papers," and was commented upon freely, as follows: (0).

A headline in the always interesting and newsy St. Joseph Stock Yards Journal reads: "Beef Shortage Accumulates," which reminds one of the fellow who complained of the "swelling of an aching void."

He wrote the headline, "Control, Don't Strangle Business," but the compositor and proof reader, who evidently had had their telephone troubles, got in the paper this appeal: "Central, Don't Strangle Business."

An editor of the Live Stock World admits that he has paid as high as $3.50 for a meal. But at the same time he claims that he frequently satifies his hunger for 15 cents. Admitting the first proposition, the second one seems highly probable.

Arthur Capper's latest annexation is said to be the Oklahoma Farmer, published by Frank Greer. It looks as though Nebraska, Missouri and Oklahoma, as well as Kansas, would soon be receiving their "leading farm papers" by way of the postoffice at Topeka, Kas.

B. O. Cowan, who for a number of years has been, to the breeders of the Southwest at least, the "official heart" of the American Shorthorn Breeders' Association, is seeking health in a trip to Europe and Africa. Mr. Cowan stuck to his work last fall and winter after a serious illness, until his association's directors ordered him to take a rest and kept his pay going so they could compel him to obey orders. Even at that we expect to hear he has introduced Shorthorn cattle into Egypt.

Don't get the idea that there is anything inconsistent about hauling feed over (or through) the "impassable"

roads we have been having. Remember the rabbit that escaped from a dog by climbing a flag pole: it had to.

When C. W. Post of Post City, Tex., Postum, Post Toasties, Grape-Nuts, etc., won the grand championship on his car load of Poland-China hogs at the Ft. Worth stock show in March, he was heard to exclaim, "There's a Reason."

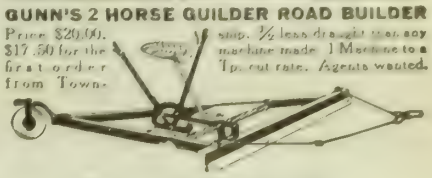
BREEDING ROOM.

Some have the opinion that capsule breeding can be done only in an especially prepared barn, with an office made especially for such work. Last spring the writer bred 17 mares in a pasture, with nothing but wire fences and a buggy for improvements. The semen can be kept in the extractor, so that it will not come in contact with the direct rays of the sun, and can be transferred into capsules in a very small shaded spot, but it must be done quickly, and the cap ought to be placed on the capsule, and the capsule held in the hand, so that the sun cannot strike it.

It is a better, however, to have a room that can be kept clean. If breeding is done in a barn, the walls should be swept and the floors kept clean, so that a current of air cannot carry the dust into the semen, or come in contact with any of the appliances, that are be inserted into the uterus. One of the principal things is to have plenty of soap and water and clean towels. The finger nails must be trimmed so that they can be kept clean, and not irritate the mare. If the weather is cool, and a current of air is blowing, it is difficult to keep the semen the right temperature. This calls for the closed breeding barn, but after the weather gets warm and the breeding hour comes after noon, the best breeding place is a shed, with the east end out, so that the morning sun can come in contact with as much of the surface as possible. The sun is a great germ destroyer.

It is not advisable to do much capsule breeding until the weather gets reasonably warm, unless one is prepared with a closed barn, where all of the mares can be taken in, and a reasonable temperature maintained.

"IMPROVED BARREN MARE IMPREGNATOR."



Many requests have been received asking our opinion of the so-called "improved barren mare impregnator." This is a funnel-shaped arrangement that is inserted into the neck of the womb, with a bag attachment, and the directions say that it will catch the semen every time.

About five years ago the writer tried a similar arrangement which was much better than the one described, and he succeeded in spoiling two good stallions and one good jack, so that they were never dependable servers after that, and he found only one stalion and three jacks that would make over three services with this arrangement in the neck of the womb. If there are any who wish to injure their breeding stock, they can use breeder's bags, cervical plugs and the so-called barren mare impregnator.

The dealer who is selling the improved barren mare impregnator, guarantees everything he sells. Last year he sent out a "barren mare impregnator" which was guaranteed to give satisfaction or the money refunded, but it seems that after he received $5.00 in cash, for an arrangement which could cost perhaps ten cents to manufacture, he failed to return the $5.00 when the impregnator proved unsatisfactory. It is interesting to know how many suckers there are who have grabbed the bait of this individual. His literature is sent out for the purpose of selling breeding appliances, but we do not believe it is intended to be of much service in using them. Last year his literature said not to take the semen out of the uterus, as the mare might be infected, but this year he sends out an "improved barren mare impregnator," which will not stand boiling very long, and his instructions is to insert this into the uterus. Last year he did not have any instruments that would take the semen out of the womb, but this year he is willing to let the breeders infect the womb of their mares, if he can sell some of his goods. He was very cautious last year lest some of the breeders might injure some of their stock, but he has even gone so far this year as to ad-

STALLION SERVICE RECORD BOOK

Every Stallion or Jack owner Should have this record book, because it is accurate. It is a handy pocket size, with a Waterproof cover, printed on best of paper.

It has a calendar, also a gestation table. It has an index of ten pages, so that each mare can be found easily It has room to give a complete record of each mare. 100 mares can be recorded, each mare having a whole page. The blank at the bottom of each mare's page, when properly filled out and signed gives you a promissory note that is legal and binding.

If you ever use one of these records you will want more of them, just as thousands of others are doing. It has no worthless advertisements in it. It is the latest Stallion Record Book on the market. If you are not satisfied with it, return it, and get your money, which will be cheerfully and promptly refunded to you.

PRICE: 50c EACH, OR 6 BOOKS FOR $2.00

vertise an extractor to take the semen out of the womb. This extractor looks like a toy, and possibly its principal mission is to discredit the Carlson Semen Extractor, now used in connection with the only successful method of artificial breeding, because the extractor he advertises is, in our opinion, will not be a success.

BREEDING HOURS.

In the March 5 issue, under the title of "Starting the Capsule System" we stated that the breeder could have every forenoon off, but it should have been every other forenoon to transact such other business as he desires. Two services one day, and one the next, is all the average matured stallion or jack can successfully make. It is not necessary for new beginners to state that they are going to use the capsule system. The day that is advertised to make only one service (Tuesday, Thursday and Saturday of each week, say, at 4 o'clock, or such other hour as is suitable in that locality) they will often get a number of mares together at one time. Then the capsule system can be brought up by degrees. During the busy season most farmers will be willing to accept the capsule system in order to get back to their work.

Every breeder should have some time to look after his business other than being compelled to remain at the barn from early in the morning to late at night every day through the entire breeding season. Quite frequently it is necessary to solicit business or make some collections. On Saturday, especially, they should have the opportunity to meet the farmers as they come to town, talk with them, solicit their business, look at their mares, give them advice, etc. If any object to the capsule system it can be explained to them, that they can bring their mares back the next day and receive the natural service in their proper turn. By having an opportunity be times when it will not be necessary to make the two regular services on the odd days, which will be of much relief to the breeding stock.

A postal card can be sent to all the mare owners stating that one service a day will be made on Tuesday, Thursday and Saturday, at 4 o'clock each day, and two services a day on Monday, Wednesday and Friday, one in the forenoon and the other in the afternoon, stating that colts are stronger and better when a less number of services are made, and that you do not wish to injure your stallion.

The capsule system is getting so well established that there will not be much opposition to it, for as a rule this year in nearly every locality in the principal horse raising districts there will be some capsule colts. The thousands of breeders who are successfully using this system this season are great advocates of modern breeding methods. It is to the advantage of the owner of every good stallion or jack to thoroughly study this situation, as it means money to them.

BEST PULLING HORSES .

We have often thought that some arrangement should be made where draft horses could be thoroughly tested. We believe it would be a great attraction at the state fairs and county fairs to have a plan by which a pulling contest could be had. This might be the means of testing the different breeds. There are many stallions which are worked, that could be educated to pull a heavy load. A strong wagon could be secured, suitable for one horse, where some official could weigh the loads, and record the tests. Some of the large exhibitors might be interested in a test of this kind, as there are many of the heavy stallions which are broken to harness. We will be glad to hear from some of our readers concerning a test of this kind, giving suggestions for the best method of conducting it.

RECOGNIZED RECORD ASSOCIATIONS

SECOND PAPER--SHIRE HORSES.

Everyone interested in improved live stock should be familiar with all reliable record associations. There are some bogus record associations that have no value, but with names similar to those of some recognized associations, an arrangement likely to confuse if not to actually deceive the public. The names and officers of some of the recognized associations have been changed, which adds to the difficulty which the average breeder experiences in distinguishing at all times between the good and inferior associations.

In 1885 the American Shire Horse Association was formed. All Shire certificates in the United States must be signed as secretary by Charles Burgess, Sr., Wenona, Ill., who has always been the secretary of this association since it was formed. Any certificate for Shire horses not signed by him is not genuine, and should not be recognized. John G. Truman is the present president. All certificates issued at the present time by the Shire horse society are signed and inspected by both the secretary and the president before they are issued, to avoid any possible mistakes.

The present secretary and president

JOHN G. TRUMAN.

were re-elected unanimously at the last election in December. The present rules are as follows:

Rule 1—Shire stallion or mare, by sire and out of dam both recorded in the American Shire Horse Stud Book.

Rule 2—Imported Shire stallion or mare recorded in Shire Horse Society Stud Book of Great Britain.

Rule 3—Importer Shire stallion or mare, by sire and out of dam both recorded in the Shire Horse Society Stud Book of Great Britain.

Rule 4—Imported Shire stallion or mare will be admitted only upon the certificate of the secretary of the Shire Horse Society of Great Britain, or other satisfactory evidence that Rules 2 and 3 have been complied with.

Rule 5—In case of any question as to the elegibility of an animal to registry, the question shall be determined by the executive committee, and if the committee shall decide that such animal has been improperly recognized as a Shire or does not comply with the foregoing rules, such animal shall be excluded from the record.

Rule 6—The breeder of an animal is the owner of the dam (or her use) at the time of service and dictating the cross. The first owner of a colt is the owner of the dam at the time the colt was dropped.

Rule 7—An animal accepted for registry is regarded as recorded. Entry fees to members of the association, each entry, $4; to non-members, each entry, $8. Transfer fees to members of the association, $1 each; to non-members, $2 each. Remittances should be made by draft, express or P. O. order, or registered letter. Private check on your local bank will not be accepted.

Conditions.

When Entries or Transfers are made the Certificate given by the Secretary shall constitute a receipt for the fees; but such certificate shall not be binding on the Association in case of error.

In case the animal offered for entry is owned by other than the owner of the dam at time of birth, a transfer is required to the present owner from the previous owner, and if the animal has passed through one or more immediate hands, transfers must be given in their regular order.

In case of a change in ownership of an animal the buyer must obtain from the seller a Certificate of Transfer, for which a blank form will be furnished by the Secretary, which will be recorded when returned. In case of the neglect or refusal of the seller to give a Certificate of Transfer the record of transfer may be made by the Secretary upon a written approval of a majority of the Executive Committee on evidence of sale and delivery.

In all Certificates of Transfer the full name and postoffice address of both buyer and seller of the animal, and the date of the sale, must be given. If the animal is a female it must be stated whether or not she has been served. If served, the date of the service must be given, with the name of the stud book number of the stallion, certified by the then recorded owner of the stallion or his authorized representative.

THE "STAND AND SUCK" PLAN.

Everyone familiar with the "stand and suck" plan knows that it is not right to guarantee colts to stand and suck, and that it should be done away with; but the next thing is to do it. We have seen solid counties organize into associations to kill the stand and suck plan, but there are a mighty few of them that have success. When one breeder gets a little more business than some other fellow, then some one is offended, and he makes a talking point of the great combination that is going to ruin the mare owners. If the association stands pat without any break, a lot of mare owners will interest themselves in buying or bringing in stallions. One county in Iowa, several years ago, bought 13 stallions in a few weeks' time as a result of a combination. We want to see all the good stallions brought into the country where they can do a good service, but we do not want to see them too thick, as this fighting business is not profitable. There are too many other good locations for good stallions for them to fight.

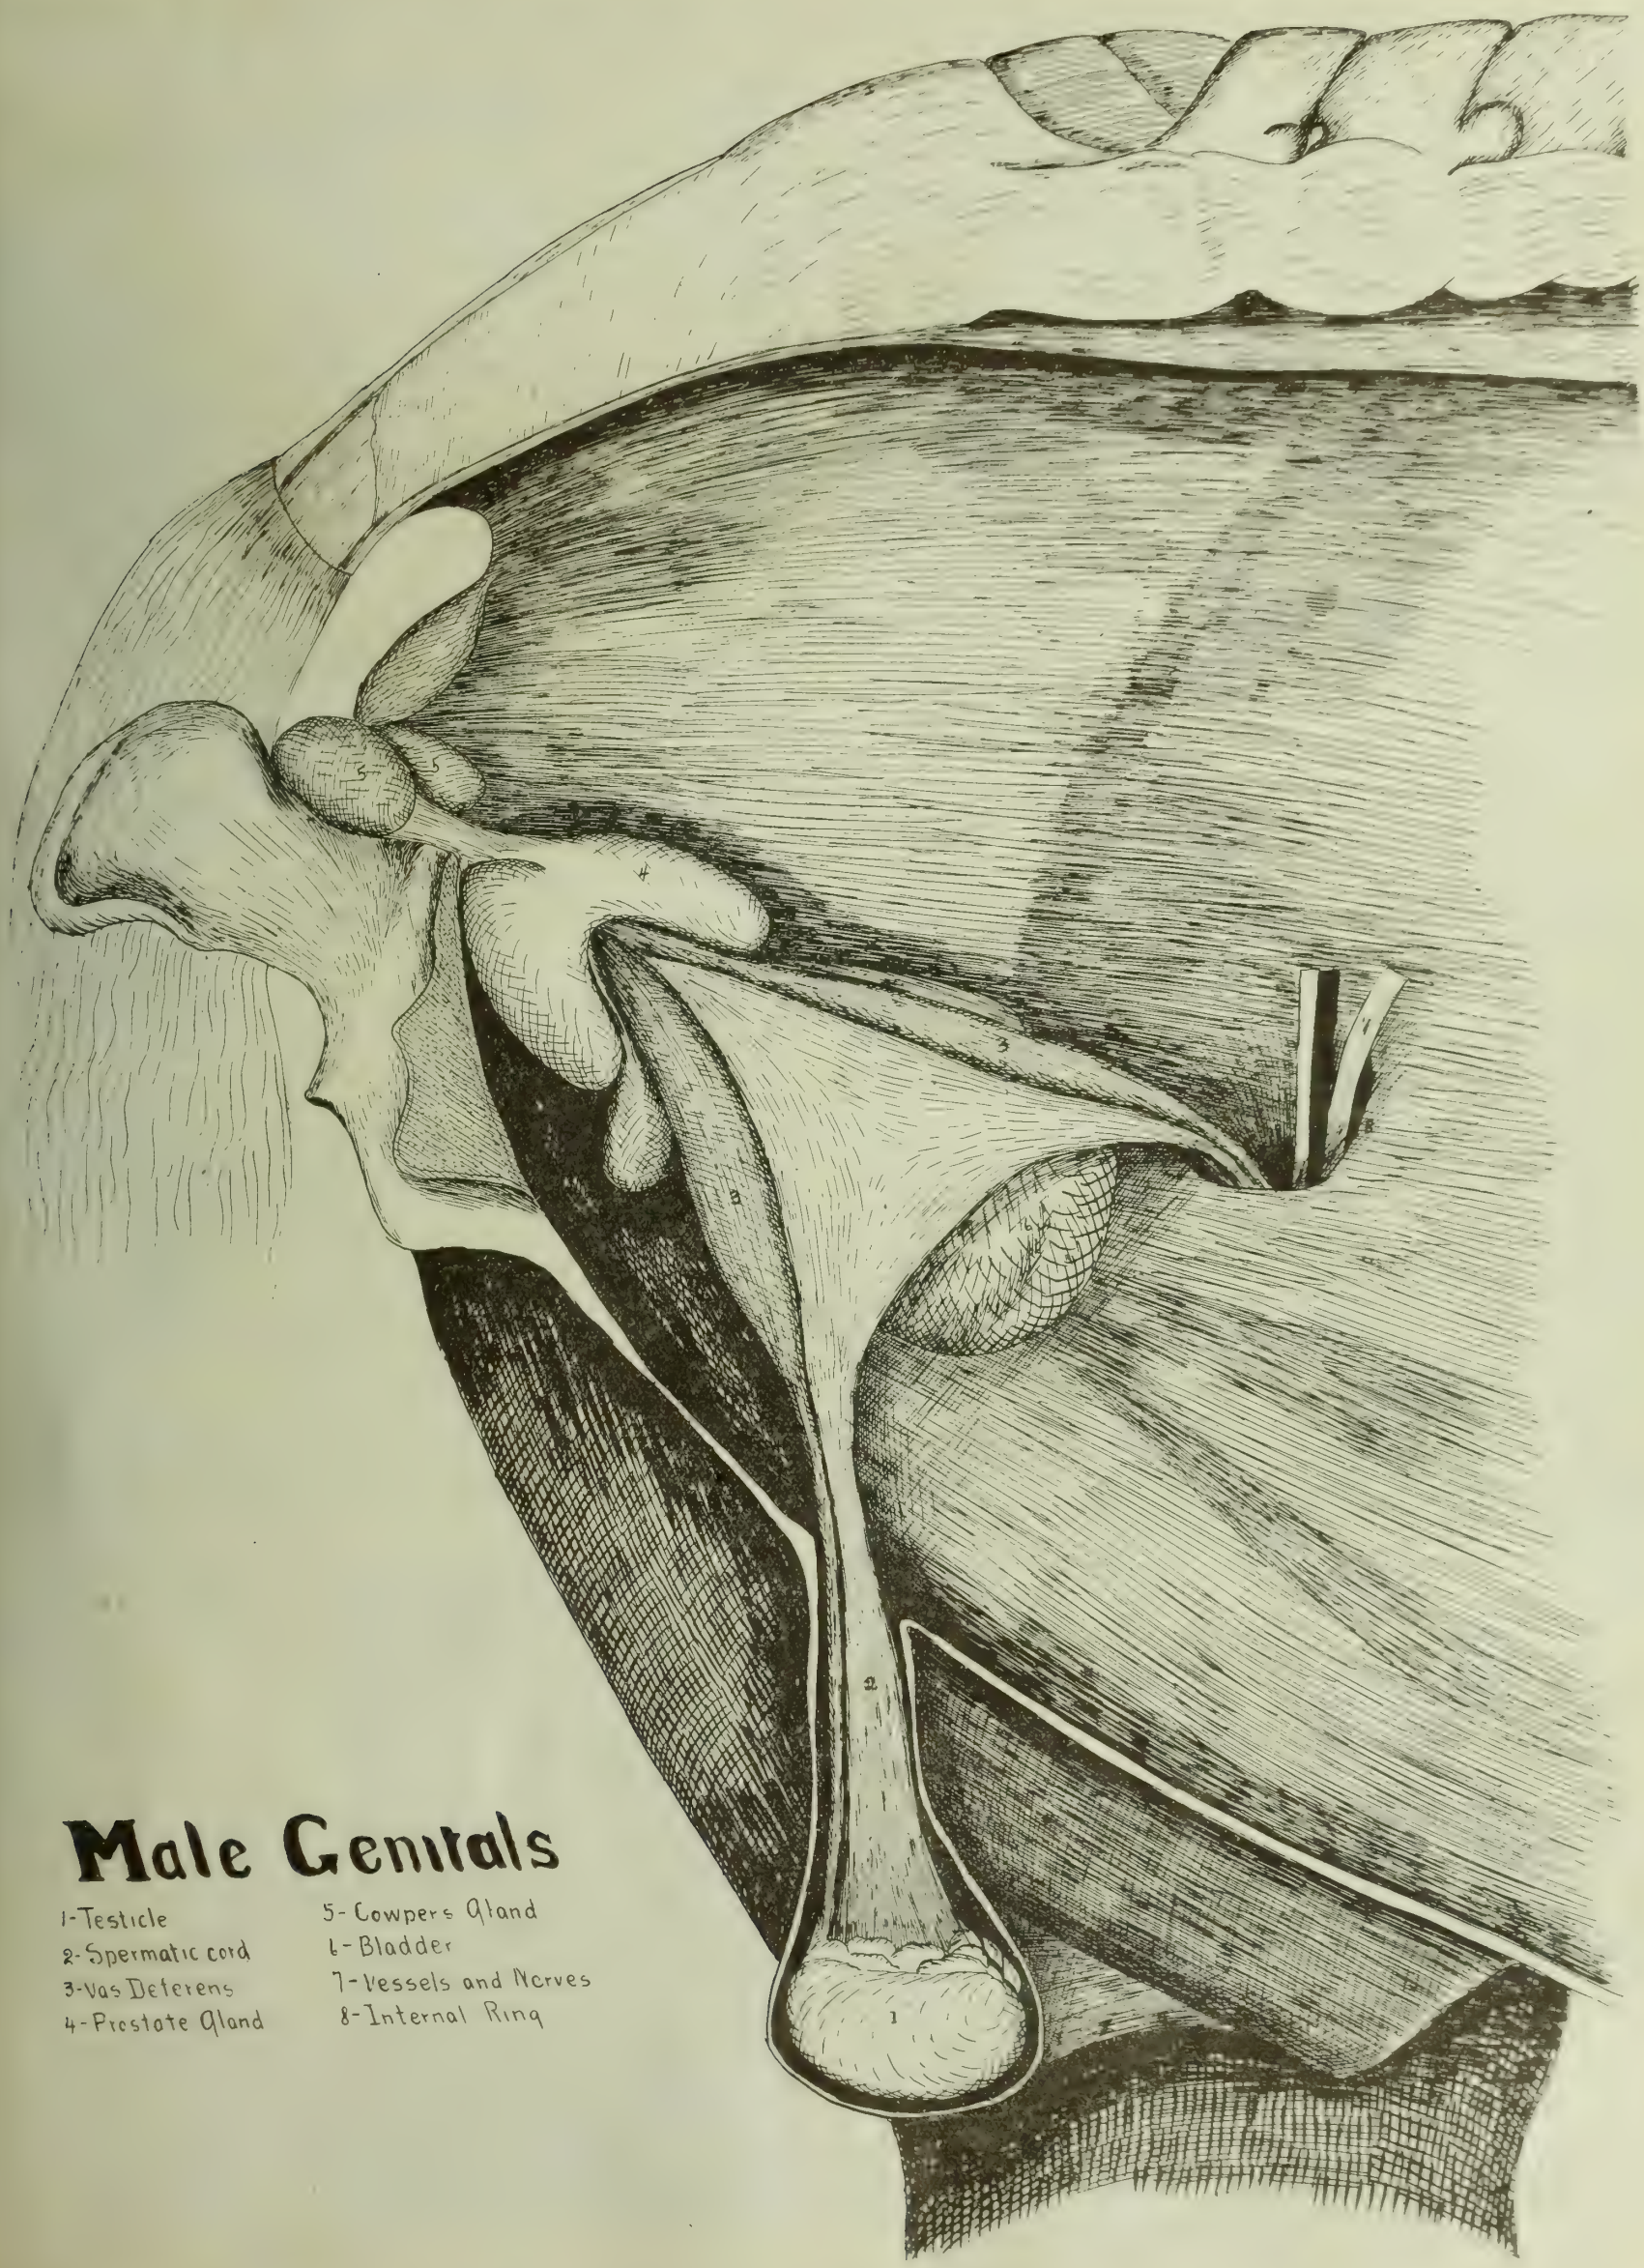
There is one plan by which the owners of good stallions and jacks can succeed, and that is by the capsule system. When 10 mares can be bred at one service such a volume of business can be done that if a few colts are lost there is still plenty of money in the business, and the price can be cut so low, if necessary, that scrub prices will not be any inducement to the mare owners.

The only relief that we know of is more education for the mare owners and the stallion and jack owners as well. There are not many men raising colts that will deliberately do anything to cause the mares to abort. If the writer was in the breeding business he would insure every colt to stand and suck, and adopt the capsule system as rapidly as possible. The individual who adopts this system, and establishes himself as a capsule breeder is going to be the successful breeder in that vicinity, if he is careful with his work. He can meet all competition because he can afford to own a better horse and can breed so many more mares than the other fellow, who uses only the natural service. It will only be a question of time in most lacalities until many of the mare owners will call for the capsule system. They are doing it now. All that is required to satisfy them is a strong, vigorous colt. They are not particular as to how it is gotten.

SUCCESSFUL EXPERIENCE WITH CAPSULE BREEDING.

To The American Breeder: After using scientific methods last year and thinking I might be of some help to some new beginner, I will give you a little of my experience. We started in last season with the capsule system and met with a great deal of opposition as it was something new here. Some would say it was not natural, others would say that the colts would not live to be over three or four years old.

But I did not fall out with them. I old them I never fell out with a man because he wasignorant. I told them there were many things that I was not posted on, and I took great pleasure in explaining everything so they could understand it. We bought us a good microscope, and every day we would let them look at the spermatoza under the glass, and let them see what they were like, and convinced many in this way. We had men to come to our barn that believed that it took the entire discharge from a horse or jack to make a colt.



We made it a rule to breed no mares without an examination, unless they had a foal by their side. And had we not have done this the first five mares that were presented at our barn would have put us out of business, as they were all diseased. But I gave them treatment and succeeded in foaling them all. We treated all diseased mares free, that were to be bred at our barn, because if we had offered to charge them, they would have yelled "graft," as all that has been needed in this country was to have a mare in heat, and she was bred. If she produced no foal the mare owner said it was the horse's fault. The horse owner said it was the mare's fault, and neither of them knew, because they had no way of finding out.

We examined and treated mares in the forenoon, and bred in the afternoon, commencing at two o'clock, which enabled us to get through and give people who came a long distance a chance to get home without rushing their mares. When we were ready to breed, I always selected a healthy mare for service, and after washing her parts clean, I wrapped her tail with a clean bandage so in case I caught some of the semen in the pan it would be free from dirt, and also to protect the stallion from coming in contact with the hair as sometimes the penis chafed if the tail is not wrapped.

After the service if no semen was caught in the pan I took my Carlson's Semen Extractor and extracted it from the womb. I then emptied the contents in a black or blue bottle which has been thoroughly sterilized and then I can cork it up and let it float in my pan of warm water, which contains my thermometer. By using the bottle we can see exactly how to divide the semen to the amount of mares we have on hand. Sometimes we run out of semen when using it out of the extractor, because we can't tell how much we have.

But I find the secret of the whole thing is this, to know how to get the semen from the mare's womb, and to take care of it after you get it, and above all to be clean, keep everything sterilized with boiling water. Keep your hands clean, your breeding room clean, the outside premises clean. In fact keep everything clean. Have an antiseptic wash ready and when your horse dismounts give his penis a good cleaning before he is taken back to his stall. If you will do this you are bound to succeed with the capsule system.

We had the pleasure of having with us the 30th of last May, Mr. G. L. Carlson, and would like very much to have the editor of the American Breeder out to visit us this season. —J. R. Smith, V.S., Mgr. Hawkins' Scientific Breeding Barn, Baylor county, Texas.

Our Harness Horse Talk

Effect of Racing Yearlings On Their Later Development and Usefulness. A Lesson From the Big Yearling Season of 1892.

Written for The American Breeder, by Henry Ten Eyck White.

There is no question in which the breeder of harness horses is more vitally interested than that which concerns the serious training of yearling trotters, done with the idea of discovering if they are capable of a mile in 2:30, thereby becoming "standard by performance" as yearlings.

As long as the National Trotting Association permits yearlings to be given records when raced against the watch the crippling of the babies will proceed, because there always are plenty of men who worship the time fetich long after it has ceased to have any virtue—as is the case with the 2:30 record as applied to a yearling trotter. Since two of that age have beaten 2:20 and another has put 2:21¼ to his credit what's the use of talking about 2:30 yearlings? Still, seven were added to the list last year, and likely as many will get there in 1912.

Among the miscellaneous information concerning yearling trotters recently put in circulation is an item to the effect that in 1892 Harvey Ernest had a yearling that won over $7,000. That is true. The filly's name was Conformation, and the fact that a dozen or more races for yearlings were given that year is precisely what made the turf authorities forbid further contests for money at that age. It was winning a $5,000 stake at Independence that put Conformation at the head—but she never again was heard of.

As I was one of the "seen him when he done it" people in regard to the yearling trotters of 1892 and recalled many of that much abused band, I decided to get together all the information I could regarding them in order to show readers of the present day what a big band of yearlings were out for the money that year. No doubt I have missed some of them, but no important one has been overlooked. My idea was to discover for myself and the rest of the world just how many of the yearlings raced in 1892, the "big year" for that pastime, amounted to anything in after life, knowing that no matter what the returns showed they would make interesting reading and incidentally teach a lesson pro or con as to the training of the twelve-monthers. I first made a list of the performers and arranged them according to sex, giving their yearling records when they had any, and I may say that although there were plenty of them unable to beat 2:30, some of that variety flew at easier game and did the best they could, as will be seen by their records in the subjoined tables:

Stallions.

Anthracite by Nutcoal	2:49¼
Astrion by Prairie Star	2:55½
Allan King by Allandorf	2:56½
Altoneer by Sphinx	
Billy Parks by Dauntless	
Billy McKinley by Little Mike	2:52
C. W. Williams by Reville	2:53
Charlie Smith by Altar	
Denver Medium by Superior	
Egremont by Egbert	
Ferron by Allerton	
Freeland by Alfonso	
Harry Davis by Luminator	3:13
Heather Bell by Electricity	
Judge Wilson by Tom Rogers	
Kiersted by Referee	
Normandy by Egotist	2:38½
Peter Edison by Aubrey Nellis	
Robert Ivanhoe by Robert L	
Rowena Wilkes by Wilkes Bird	
Red Heat by Red Hot	

Fillies.

Celaya by Allandorf	
Conformation by Cuyler	2:37
Delabel by St. Bel	3:07¼
Ella Woodline by Woodline	2:29¼
Leone by Lancelot	2.28½
La Comptesso by Luminator	
Marjo by Sherman	2:53
Mamie Duncan by Nuthunter	
Nelly A. by Wilkes Boy	2:29¾
Noraline by Coralloid	
Periwinkle by Ponce de Leon	
Roselight by Light Hal	3:08¾
Zulu by Zorokh	

Now, all those youngsters were well bred for their day, and that they could trot way above the average as yearlings is shown by their being trained and campaigned at that age. There of the fillies were good enough to take records below 2:30, while another was marked in 2:37. That would be pretty good today. It goes without saying that practically all these stallions and mares that took honors as yearlings in 1892 were used in the stud. Two decades have passed since then and their history as porducers or progenitors of speed now may be written with truth and accuracy.

And here it is: Two of the 21 stallions listed above have sired speed, Altoneer being credited with two pacers, and Ferron with four trotters. Two of the 13 fillies have produced speed, Leone being the dam of two trotters, one pacer and one sire that has gotten four trotters and two pacers, and one of her sons has sired a solitary trotter.

A pretty impressive showing, no matter how you look at it. If those 34 yearlings ahd been just ordinary yearlings their present history would not mean anything in particular. But they were the cracks of their day as to yearling speed, and they were, as a lot, well bred. As a whole they have failed good and hard in the breeding ranks, and even the friends of their youth cannot justly find fault with this characterization, because twenty years is plenty in which to judge a stallion or mare as to speed production in the first generation. And as 1892 was the banner year in the training of yearlings the crop that was out that season probably was the best in quality, and that 13 obtained records showing them to have 20-miles-an-hour speed or better is the best evidence it was a band of fast, natural trotters.

Now, if being trained as yearlings doesn't injure colts, as some people have rather hotly contended in the turf papers this winter, it naturally follows that a lot of the 1892 yearlings capable of taking decent records at that age must have gone on and very much reduced those marks, for everybody with experience in such matters knows that the greatest speed improvement is between the yearling and the 3-year-old form. Well, here is a list of the 1892 record yearlings with the records they made that season and the reductions in the same, where 2:30 or better subsequently was reached:

Name.	1892.	Final.
Leone	2:28½	2:28½
Ella Woodline	2:29¼	2:23½
Nelly A.	2:29¾	2:13
Conformation	2:37	
Normandy	2:38½	
Anthracite	2:49½	
Billy McKinley	2:42	
C. W. Williams	2:53	2:14½
Marjo	2:53	
Astrion	2:55½	2:30
Allan King	2:56½	
Robt. Ivanhoe	2:58¾	
Delabel	3:07¼	
Roselight	3:08¼	
Harry Davis	3:13	2:23¾

There are some facts worth more than all the arguments that have been or can be made by all the orators in horsedom on the subject of training yearlings. They concern the yearlings of the best season the training of yearling trotters ever knew. There are 15 horses in the above list out of about 30 that were prominent in the 1892 purses for yearlings. In other words, it was the biggest crop ever known and the quality was way above the average. It all happened 20 years ago, so the present inquest must bring out the whole truth.

What do we find? First, that of the three 1892 yearlings that beat 2:30 only one materially reduced its record in after life. That the two having records between 2:35 and 2:40 made no reduction in those marks. That only two of the 15 yearlings of 1892 that took records ever beat 2:20, they being Nelly A, 2:14, and C. W. Williams, 2:14½. Now, it hardly will be argued that this is a particularly good showing in the line of speed devel-

NOTICE TO BREEDERS.

Experienced Stallioner, with 6 years' experience with artificial impregnation, and three years with capsule system, is now open for a position with a good, reliable breeding establishment. Using capsules I have got seven mares in foal out of eleven, all bred in one day from one service of a sure foal getter.

Can furnish unquestionable reference. Address

Johnson Automatic Stallion Bridle

Patent Applied for Nov. 10th, 1909.

Manufactured exclusively by Peter Young, Assumption, Ill.

Controls the most unruly stallion without injury and will not hurt the kindest and most docile horse. Fits the largest draft stallion or the smallest roadster without adjustment. Made of the best leather. Shipment will be made on receipt of order, as I have them in stock at all times.

Order one, and if not satisfactory, return it and your money will be cheerfully refunded. Price $5, with order. Can be sent by mail. Read these testimonials:

"Enclosed you will find check for $5 for which send one of your stallion bridles to Mr. Jacob Haning, Minier, Ill. Please send at once and oblige.

"P. S.—I have been using one of your stallion bridles for some time. Would not do without it, as you soon have perfect control of your stallion in a short time. Please send bridle to Mr. Jacob Haning at once. Send by mail. Val. Thomas, Jr., Hopedale, Ill."

"I have used the bridle but a few days which I recently purchased from you, but must say no horseman can afford to be without it. It will hold any horse. There is no equal to it. I advise every horseman to have one. E. A. Berlin, Waterloo, Wis."

"Will say the bridle I ordered came all right. The horse that we wanted it for was one that we could not use with a chain under the jaw. Had to use rein over his neck and hard to hold back at that. The bridle surprised him very much. My son says he cannot say too much for it. De Mott & Son, Scottsbluff, Neb."

PETER YOUNG,

Assumption, Christian County, Illinois.

"Ripping Good 58826"

Standard bred **BAY STALLION,** foaled 1906. Sired by Larabie the Great 2:12½ (by Jay Bird, by George Wilkes), dam Kittie Director, by Director Chief 10440 (by Director 2:17); grandam Kitty Phallamont, by Phallamont 3175 (by Phallas 2:13¼); third dam Edmonia, by Dictator 113; fourth dam Leah, by Woodford Mambrino 2:21½; fifth dam Maud, by Abdallah 15. Just study this pedigree for a moment. It will bear the closest examination. All of it producing blood, valuable blood, and the kind that sells well. Three crosses to Dictator, three to Abdallah 15, three to Henry Clay, and all good ones. Larabie the Great was a good race horse and a sire of race horse trotters. This is great breeding and the horse is just as good as his pedigree. He has size, substance, style, quality, good looks and is A1 in every respect. This young stallion is for sale, and I mean business.

Before the death of Mr. Miller, whose business I managed, we refused a long price for this horse. Now the administrator orders the stock sold and one-third the money will buy this horse. He has been exercised daily and is ready for service.

We also have for sale the Percheron stallion, Imp. Eaderon, black, heavy boned, licensed under Kansas state law, good condition, ready for service.

Also Welsh ponies from imported stock.

NAVAJO PONIES.

For Sale—One or two car loads of Navajo Ponies; $12 to $20, on cars, Albuquerque or Chama.

Haynes Bros., Haynes, Rio Arriba County, New Mexico.

opment, because, naturally and of necessity, the yearlings above were picked to be trained because they showed the most speed as soon as broken to harness (or, more likely, in the pasture when weaned). They were the cream of the crop, and they were trained, taken by and large, with about as much skill as they would be today. J. B. Chandler had Ella Woodline, and "Young George" Fuller had Leone, both of which beat 2:30. The driver of Nelly A, I do not recall. Conformation was under the management of Harvey Ernest, a grand circuit trainer of that time, still alive and in the game.

The beauty of these statistics pulled from the past at the end of 20 years and compared with the facts of the present is that they cannot tell any lies or raise any false hopes. All the 1892 stallions that could sire trotters necessarily have done so, and all the fillies that were capable of producing speed at the trot have had their chance until death or old age overtook them. That those stallions and mares were selected to race, and did race, as yearlings, showed they were the best we had as to early speed. And as a whole what have they accomplished in the breeding ranks?

Absolutely nothing worth talking about. Two of the stallions have sired a little—very little—speed, and two of the mares have produced a sniff of the same thing. And the "never had a chance" excuse will not do, taking the collection of horses as a whole. On the contrary, they had better opportunities than the average trotting bred foal, and for more than one reason. In the early nineties speed was not nearly so common as it is now nor stallions with reputations so easy of access in all parts of the land, while the breeding fever burned a shade more intensely, if possible, than it now does. So we must admit that the figures are entitled to respect as they stand.

Do they prove that the training of yearlings is a good thing for the harness horse? Hardly. Do they prove that development of speed in babyhood makes for faster records in later life? Not conclusively enough to convince the average man. Do they prove that stallions and mares whose speed is fully developed as yearlings succeed better in the stud than they would have done if allowed to mature normally? It does not look that way to me.

There is no question about the present fad for training yearlings. Fortunately they cannot be raced, but the man with a baby trotter that is bred to trot early, and that looks as if he could do it can learn a lot by this history of the yearlings of the "big season" and what happened to them then and in after life.

SEASON OF 1912. $25.00

The above cut is of Rex Donnell 2042. The greatest in natural style at both ends, and with more gaits and as perfect as they are naturally performed by any living stallion in Missouri today. Two of his colts (7 and 8 months old), selling in February, 1912, at auction for $1,100. Mares from a distance kept at actual grain cost. Pasture likewise.

For Sale—Registered Saddle Mares and Geldings. Write for descriptive catalogue.

Dr. W. E. Cheatham, Proprietor Breezy Point Stock Farm,
Excelsior Springs, Clay County, Mo.

Address JAMES MUIRHEAD, Crete, Will County, Illinois.

AND KEEP ON WRITING.

March 18 was "set aside" as the day for everybody and his brother-in-law to write congressmen and senators what to do in the parcels post matter. It was a good day, and a good deed—wherever it was "did." Wherever it was overlooked March 19 was the next best day, the 20th the next, and so on, as long as there is any chance to make a letter count. A good parcels post law will be one of the best aids we can have in promoting contentment on farms, and thereby holding a good rural population where it will do the most good. The storekeeper in the small town will find that part of the business of a prosperous, contented farm population (and he can get just as much of it as he deserves, or just as much as the farmer would get of his business were the conditions reversed) is better than all he could get in case the government should continue to deny the rural population the service it is demanding.

HOW BREEDERS' ASSOCIATIONS HELP.

(Continued from page 4.)

happened to have survived the flood they would have been the first to pat Noah on the back and say they knew all the time that he was going to make a success with his big boat.

In closing, I want to say that we try to impress upon the minds of our members that the word success can not always be written after their lives in dollars and cents. This beautiful land with all it contains was given to man for his use, and from its soil he must both feed and clothe himself. Man made laws have given us a deed to hold our property during life and dispose of at death: God's laws intended to place this land in our hands to use and hold in trust for those who follow. Their food and raiment will also come from the soil. How are we caring for this land that we are holding in trust? Can we, when we are called on to give an account of our stewardship, say, here is the 160 acres I have lived on all my life; its soil is as rich as when I first plowed. Here is my live stock, better horses, better cattle and better hogs. To all who can answer thus I would write their lives successful.

CLYDESDALES.

I have a car load of Clydesdale stallions, selected by Robert Miller, of Stouffville, Ontario, from the best herds in Canada, that I will dispose of at as low prices as possible, considering their quality and breeding, to make room for another load. **R. O. Miller, Lucas, Lucas County, Iowa, R1.**

CLYDESDALES FOR SALE.

Imported and home bred mares, some of them in foal to the imported stallion, Baron Kent, half brother to the $47,500 stallion, Baron of Buchclytre. Well matched pairs and sired by some famous sires. Also the imported stallion, Baron Kent, guaranteed and sure foal getter. If you want good ones, write for prices. **David Wilson, Breeder of Clydesdales, Hebron, Porter County, Indiana.**

IMPORTED SHIRE.

For Sale or Trade—"Fordy Spark" imported number (23320), American number 8446, foaled 1904; bay, white face and white hind feet. Sound. Price $650, or will trade for large, sure jack or registered Percheron. **W. E. Carter, Batavia, Jefferson County, Iowa.**

Extra good imported and home bred **Draft and Coach Stallions** from $800 to $1,400, 2 to 5 years old, including many state fair prize-winners; recorded in U. S. approved books (not recorded grades) and fully warranted. Also **mares and jacks. WALKER BROS., Oklahoma City, Okla.**

IRVINEDALE FARM BELGIANS

¶ We have some very high-class stallions and mares that we will price very reasonable to buyers who will visit us within the next month, (as we wish to reduce our number). Among these are a number that were winners at the various shows last year. Come to the farm and we will fill your wants. **21 Ribbons Won at Iowa State Fair, 1911.**

CHAS. IRVINE. - - - - Ankeny, Polk county, Iowa.

And Still the Market Gains

Steady Stiffening in the Horse Trade in Spite of Some Adverse Commercial Conditions. Meat Producing Animals All Higher. Cattle Top, $8.50; Hogs and Sheep Reach $8.00.

Demand for horses and mules in the past two weeks has been the best this year. In the past ten days farm demand swung into the competition and a full line of buyers from other localities were present Trading has been active. Farmers this year are showing more of a tendency to buy mares than ever before, whether this is an indication that breeding is going to increase or whether it happens that the early buyers have shown a particular fancy in their trades. Prices for mares show a higher range than for geldings. City trade is largely in the last named class, though sex is of no consideration with the Eastern buyers if quality and weight is present. With the return of spring-like temperatures demand for the commoner classes has been revived and some are going to the farms as well as to the large cities. Threatened coal strike in the eastern section of the coal belt is keeping demand for mine mules small but the other classes are finding a ready outlet. The Southern trade is good. Kansas, Oklahoma and Texas are buying both horses and mules. At the beginning of the year country buyers began to complain that production had exceeded demand, and now, though only four weeks of active trading has intervened, they say it is hard to pick up a car load of good horses. One of the big dealers in Kansas City said recently that in his opinion choice heavy draft horses would never be produced in large enough numbers in this country to cause any material decline from present quotations, but there will be periods when prices will rule higher.

Prevailing prices for serviceably sound horses and mules, 4 to 7 years old, are as follows:

Drafters, 1,700-pound up	$175@300
Drafters, fair to good	150@170
Chunks, good.	135@165
Chunks, fair.	100@135
Southerners, good to choice.	135@150
Southerners.	75@125
Driving horses.	65 up
Mules—	
13½ to 14½ hands	$ 95@125
14½ to 15½ hands	120@165
15½ to 16 hands	160@210
16½ or better	190@275

Cattle, Hogs and Sheep Higher.

All classes of meat producing animals were advanced in price in the past two weeks and Wednesday hung at the highest level of the year. The advance in hogs was more pronounced than on the other two classes and since the middle of March has amounted to more than $1.50 a hundred pounds. The advance for fat cattle has been less spectacular, owing to the high prices that have prevailed in preceding weeks this year, but at the same time the rise was sufficient to offset a slight decline that had prevailed in the third week in March, and brought prices to new high levels, quality considered, for the past two years. Prices for sheep shared in the general upward movement, and the plain quality of the offerings on Wednesday was the only factor that prevented lambs from reaching the 8-cent level, along with 8-cent hogs, and eight cents and better for cattle. Supplies of all classes of stock seem to be on the decrease, and there is no abundance of any class so that demand can be shifted.

New High Record for Beef Steers.

Tuesday some Kansas steers weighing 1,454 pounds sold at $8.35, a new high price for this year. While they were thick fleshed and of good quality they were not classed as strictly prime.

Other choice steers sold at $7.90 to $8.25, and the bulk of the steers brought $6.75 to $7.50. Demand came largely from the big killers, but shipping demand for the lighter weight classes is expanding. The season of the year has arrived when feeding operations are about over and the next supply of beef from the Central West will have to be produced with grass. A few fleshy feeders are going to country points, but the movement is far short of former years, and indicates that no one is willing to incur an increased feed bill. The winter feeding season has been very unsatisfactory and if feeders could have produced good gains in weight they would have made money. But the rule was that full feeding returned slight gains in weight, and consequently feeders are rushing their stock to market short of finish and in a condition that assures the killer small returns in beef. A bunch of steers now that dresses 60 per cent or better is an exception, while a year ago, those killing out less than 60 per cent were exceptions.

According to traders the next six weeks is going to uncover a big shortage in the supply. Kansas City receipts of cattle thus far this year are more than 65,000 short of the same period last year, and will probably come to the mid-summer season with a shortage of 150,000. Up to April 1, Chicago had received about as many cattle as in the same period last year. This week the shortage began to show there.

The West a Supply Source.

Colorado steers, fattened on sugar beet pulp and hay, a little grain thrown in, and cotton seed product cattle from below the quarantine line appear the two most important sources of supplies for the next six weeks. There are several bunches of steers on feed in Colorado from 1,000 up to 5,000 bunches, all told about 30,000. The supply below the quarantine line is decreasing. Most of the Colorado steers are selling at $6.75 to $7.90, and steers from below the quarantine line at $5.50 to $7.25.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$8.00@8.50
Good to choice steers	7.50@8.00
Fair to good steers	6.75@7.45
Common to fair steers	5.35@6.70
Meal fed, choice	6.75@7.35
Meal fed, common to fair	5.40@6.70

All Cow Stuff High.

All she stuff coming to market now is selling at strong prices. Like steers the quality is very plain, and killers say they have never known a year at this season when choice heifers were scarcer than at the present. High prices for feed, and the necessity for breeding more cattle are the factors that have depleted the supply of butcher cattle. Cows are selling up to $6.25, and heifers, $7.19, and steers and heifers mixed, $7.40. Strictly prime kinds would bring a big premium over these quotations. Veal calves continue scarce and in urgent request, tops ranging up to $8.50. Bulls and stags are scarce. Choice bulls are bringing up to $5.75.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice.	$5.75@6.25
Fair to good	5.00@5.70
Common to good	4.00@5.00
Canners.	3.00@4.00
Heifers—	
Choice.	6.85@7.50
Good to choice	6.25@6.80
Plain to fair	5.25@6.20
Common.	4.50@5.20
Veal calves	4.50@8.50
Bulls.	4.00@8.50

Spring Demand for Stockers.

Owing to the small supplies offered the trading in stockers and feeders in the past two weeks has kept within narrow bounds. Prices are higher. A few half fat steers are going back to feed lots, but the bulk of the supply is stockers that are going out for the oncoming grass. Owing to scarcity traders say they expect to see no low priced stockers this year. Some 1,000-pound feeders sold up to $6.95, and stockers up to $6.40. Stock cows are in urgent request. Stock heifers are less favored than two weeks ago. Practically no stock calves are available.

The following quotations are for stock and feeding cattle:

Selected feeders	$6.50@7.00
Good to choice feeders	6.00@6.45
Plain to fair feeders	5.50@5.95
Selected stockers	6.00@6.50
Good to choice stockers	5.75@6.00
Plain to fair stockers	5.00@5.70
Stock calves.	4.75@6.50
Stock cows.	3.75@4.75
Stock heifers.	4.00@5.50
Milch cows.	40.00@90.00

Record Prices for Hogs.

Fearing that the big movement of hogs that prevailed in the first two months this year has about depleted the surplus supplies on farms, packers in the past three weeks have been engaged in such strong competition for supplies that prices were advanced $1.50 a hundred pounds to a new high level for the year, and it is quite probable that further advances will follow. On Monday this week, all the markets except St. Joseph and Omaha reported $8 hogs, and in the past two days 8 cents or better has been the ruling top. The bulk of the hogs are selliing at $7.60 to $7.95, and the spread in prices has narrowed materially. The average weight is still light, running about thirty-two pounds

H. Redenius, Rushmore, Nobles, Co., Minnesota.

Imprecation

The sensational prize winning Percheron stallion, IMPRECATION (79214) 79304, imported by us in 1911. Gray horse, foaled April 24, 1908. Weight 2,200 pounds.

First prize winner, three-year-old class, and grand champion stallion at the International Live Stock Show, Chicago, 1911, and the ONLY HORSE IN AMERICA HAVING THE DISTINCTION OF BEING SUBSIDIZED BY THE FRENCH GOVERNMENT for use in France.

As a large number of breeders of pure blood Percheron horses are desirous of breeding to this great horse, we have decided to accept a limited number of approved mares for the season of 1912, at our farm, Lafayette, Ind.

TERMS.

$100, cash at time of service, to insure mare in foal. Should mare fail to prove in foal, she may be returned free, or breeder may substitute another mare free of charge; and if horse should be sold, or not in our possession at the time mare is returned, money will be refunded.

Mares sent here will be carefully cared for on pasture, free of charge, and if fed grain, reasonable charges will be made. We will not be responsible for accidents.

All who want to take advantage of the opportunity to breed to the "GREAT CHAMPION" should write us at once. Picture and breeding of IMPRECATION sent on request.

We have 100 to 200 head Percheron, Belgian, German Coach and Hackney stallions and mares always on hand.

J. Crouch & Son, Lafayette Stock Farm, Lafayette, Indiana.

Dr. W. H. Richards

IMPORTER OF

Belgians and Percherons

PLEASANT VIEW PERCHERON STOCK FARM

I have for sale a choice lot of imported and home-raised Percheron stallions and mares. A number of them are sired by the famous horse Barnum, that was champion at the International in 1904. Prices reasonable. Come and see them and I will save you money. Marcus is located 44 miles northeast of Sioux City on the I. C. R. R., in Cherokee County.

Chas. P. Quirin, Marcus, Iowa.

AND STILL THE MARKET GAINS.

(Continued from page 14.)

less than a year ago. Reports from the country indicate that in March less than 30 per cent of the pigs farrowed were saved. This is an unusually small per cent and means a pronounced shortage in supplies of hogs later. Packers have forecasted the shortage in the way they have been after supplies, and unless improving roads uncover some increase there will be a further advance.

The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week
Mon., Mch. 25..	$7.00@7.70	$6.25@6.97½
Tuesday.	7.15@7.85	6.35@7.10
Wednesday. . ..	7.25@7.85	6.50@7.25

Another Advance for Sheep.

Demand for sheep was stimulated by the warmer weather and at the same time supplies have not been up to expectations. Prices for mutton have been the lowest of any dressed meat and consequently consumptive demand is broad. Choice lambs are quoted at $7.50 to $8, yearlings, $6 to $7.10, wethers, $5.25 to $6.40, and ewes, $5 to $5.90. Clipped lambs are selling up to $7, and a few early spring lambs for the Easter trade brought $12 to $15 a hundred pounds.

LIKE MADERO'S RECEIPTS BEST.

The views on the Mexican revolution voiced by the many stockmen who have been, and still are, seriously interested in this trouble are well illustrated by a recent interview with the manager of a cattle company in Southern Arizona. It seems that for two or three years now it has been the common experience with ranch men to wake up in the morning—or at almost any other hour of the day or night—and find a band of Mexican beliggerents driving away their live stock. If it happened that the animals were taken by followers of Madero, a complaint to headquarters would secure a receipt for the animals taken and these receipts since have been cashed regularly upon presentation to Madero's government. "But," says the manager, "it is a different crowd that is carrying on the war now. They take whatever they want and give us nothing." The hope prevails among many range men interviewed that something will happen to cause the United States to intervene.

Every country in the world that has diseased plants that cannot be sold at home can ship them to us. This results in great loss. The chestnut disease here is an illustration.—From the 1911 report of the United States Secretary of Agriculture.

FOR EXCHANGE—80 acres, 1 mile from Drury, in Douglas County, Missouri. Log house 18 by 36. Three rooms, shingle roof. Frame smoke and hen house with shingle roofs. Log barn and granary 36 by 36, shingle roof. Well at house. Spring in pasture. 20 acres under cultivation, rest timber. On public road, school house at corner of farm. Price $2,500. Mortgage $500 at 8 per cent. Want jacks, stallions or western land. Address, **The Allen County Investment Company, Iola, Allen County, Kansas.**

STOCK AND ALFALFA RANCH FOR SALE—7 quarters deeded and 9 quarters leased land, all in one body. Good improvements; plenty of spring water. Land one mile to county seat. 350 acres of this land will grow alfalfa by subirrigation. Cut 5 crops last season. Only alfalfa proposition in this section. Can sell all the baled alfalfa you can raise at your door for from $16 to $25 a ton. Price $10 an acre for the deeded land. Address owner, **W. P. Bailey, Springfield, Baca County, Colorado.**

MORE ABOUT BLUE GRAY CATTLE.

To the American Breeder:—I want to thank you for the way you handled my article. I was glad to have it appear in such a splendid number. I was pleased to note that the number also contains an interesting article on the "Blue Gray" by Prof. Wentworth. In connection with the article on the "Blue Grays" I hand you a recently received letter from Mr. Walter Biggar, the Range Farm, Dalbeattie, Scotland, in which he tells of the demand for pure bred Galloway cows in Great Britain for crossing purposes.—R. W. Brown, secretary Galloway Record Association. Chicago, Illinois.

(Extract From Mr. Bagar's Letter.)

"I am wondering whether the white Shorthorn bull has been tried with the Galloway cows to any extent with you? This is a cross that is practiced almost universally in a great part of North England and all through Scotland with great success. Galloway heifers for such purposes are in strong demand, and I have orders for more than I can find.

"Autumn sales were all very dear (high) and an advance over last year. Our great fat stock shows found the breed out as strong as ever and some very fine steers were on the show circuit. Galloways were also winning supreme honors at some of our local fat fairs against other breeds, notably at Ayr, where the breed carried all before them, both in awards and sale. A Galloway heifer shown by Colonel Kenedy won championship there against all other breeds and made the record price for all breeds in the sale, selling at 80 shillings per 112 lbs. live weight."

BETTER WESTERN BULLS.

Over most of the western states organizations are frequently found where a number of cattle men co-operate in the round-ups and in looking after their interests in that particular section. Practically all the cattle on that particular range are turned loose together. If one breder should buy a number of good bulls they are just as liable to serve cows belonging to the other breders on the same range as they are to mate with cows belonging to their owner. It requires a great many bulls to do the service for each range, owing to the plan of using them.

One other difficulty often arises because of the small farmer, who has a dozen or more cows and is liable to drive a good bull to his horse pasture where the bull is salted and made content with the surroundings to the extent that it will remain with the cows during that season.

If all the ranchers belonging to such an association would agree to buy good bulls, this would certainly be a great advantage. A good bull will enhance the value of each calf several dollars, over the inferior kind. This should be talked over at the association meetings and these bulls could be changed to other localities after they have heifers old enough to be mated with.

It would be an easy matter for all interested in an association of this kind to go in a body to a section of the country where bulls are procured and buy a train load at a time. This is worth considerable thought. The time is coming when there will be no free ranges, and the cow stuff must be of value for it will not pay to spend money for pasturing inferior females. There is only one sure way to help increase the quality of this particular stock, and that is through using better sires.

FT. WORTH CHAMPION DRESSED HIGH.

One of the high dressing percentages reached by the fat stock show champions of this country was achieved by the champion grade and cross bred steer at the recent Fort Worth, Tex., show. This steer, shown by Lee Bros., and sold to Swift & Company, weighed 1,460 pounds, and dressed 70.07 per cent. The champion steer of the last International Live Stock show dressed 69.87 per cent, and last year's Fort Worth champion dressed 67.2 per cent. Other prize winning steers in the Fort Worth show dressed from 68.2 per cent down to 56.09 per cent, the higher percentage being made by a first prize pure bred Shorthorn weighing 1,700 pounds.

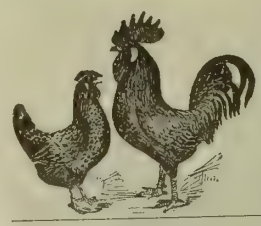
GOOD STOCK PAYS.

A few years ago the poultry editor was practically the only breeder of high grade thoroughbred chickens in this town. When zero weather set in it appeared that I was the only one in town getting eggs. The baker did not wait for me to bring him fresh eggs—he was afraid some one would get ahead of him—so he came to get them almost every evening.

I became quite an important man in my way—people stopped me on the street to "talk chicken" and they came to see how I did it. A chicken boom was started. The next winter I had some competition. Last winter was mild and there were plenty of eggs.

This winter is the severest in years—the thermometer has stayed around zero two weeks now and my pullets have not slackened one bit in their egg production, but I have nothing to blow about—there are dozens of people here getting eggs and the hotelkeepers and bakers are quite independent. In every case that I have heard of it is the keeper of pure bred poultry that is delivering the goods. They are not all the breeders of the so-called popular breeds, either. One of my friends keeps two breeds—one to supply the popular demand and one for his own pleasure and profit as well. His best pen is of a variety that is seldom heard of, though another color of the same breed is very popular. These birds are turning out better than a 50 per cent egg yield every day. I do not wish to convey the idea that the breed is all that is necessary—I know some who have good pure bred hens that are getting very few eggs—the housing question is very important. The fresh air houses are proving very satisfactory. I have not found one yet that will keep the cocks combs from freezing. I read many reports from the northern states and Canada of men keeping cockerels in open front houses with no fear of freezing. There must be a difference in zero weather conditions—my house is built exactly like the inventor's specifications and no single comb cock is safe in it when it gets to zero. But the hens and pullets are as happy as larks.

A few good hens in a good house and a variety of good feed will fill the egg basket in the winter.—C. D. A.



POULTRY POPULATION AND VALUE.

The census bureau's report on the poultry of the United States shows 80 per cent increase in value, and 18 per cent increase in the number of domestic fowls on the farms between 1900 and 1910.

The total value of all poultry on the farms in 1910 exceeded $154,000,000. Of chickens the number reported is 296,000,000, an increase of 20 per cent the ratio of increase in population.

in ten years, just about the same as

Iowa is the leading poultry state, with a total value of $12,250,000 worth. Those ranking next in order were: Missouri, $11,871,000; Illinois, $11,697,000; Ohio, $9,533,000; New York, $7,879,000; Indiana, $7,762,000; Pennsylvania, $7,674,000; Kansas, $7,377,000; Michigan, $5,611,000; Texas, $4,807,000.

SINGLE COMB BROWN LEGHORNS

Eggs. The great all year laying strain. None better. My method for range insures strong, vigorous chicks, with vitality. Satisfaction guaranteed. Eggs for sale, $1 per 20; $2.50 per 50; $4 per 100 eggs.

Mrs. H. A. Brookhart, Arabela, Scotland County, Mo.

STAPLES' BLACK LANGSHANS—Great winter layers. Some choice young cockerels, the best I ever raised. Some choice Duroc Jersey swine, young stock; male, females. Write today. Plainview Farm, Mrs. Jas. A. Staples, Mgr., Lamonte, Mo.

Buff Orpingtons

Eggs from Standard bred hens. Cock, golden buff, scoring 95 by Russel; 15 eggs, $3; mature pullet eggs, $1.50. **Carl D. Adams, Olathe, Johnson County, Kansas.**

EGGS OF INDIAN RUNNER DUCKS. From imported blood. Noted for shape; wonderful egg production; large white eggs. Grand prize record. **M. H. Schlotzhauer, Indian Runner Duck Specialist, Pilot Grove, Mo.**

ABERDEEN ANGUS BULLS

and a few choice females from 15 to 30 months old. No better individuals. No better bred. Close to city. Can be easily inspected. Address **George Stevenson, Jr., Leslie-Orear Bldg., Kansas City, Mo.**

FOR GALLOWAY CATTLE and OXFORDDOWN SHEEP, see Maple Grove Herd

where the prize winners are bred. Undefeated "get of sire" for 3 years in succession. **C. S. Hechtner, Route 3, Chariton, Iowa.**

Capital View Herd of Registered Galloways

Good young bulls, reds and roans by our herd bulls, also few good boars ready for service. Write or come and see them. Mention this paper.

C. S. NEVIUS, CHILES, KANSAS

BIG THING FOR MISSOURI FAIR.

State fairs are always looking for something big in the way of attractions, and the Missouri state fair seems now to have found the biggest one ever. Missouri's territorial government was established in 1812, and now it is proposed to hold a centennial celebration of this event at the Missouri state fair in Sedalia next October.

If a neighbor has a better beast than yours, give him the credit due—but to buy or breed a better one in turn, is up to you.

SOME RESULTS OF CATTLE-TICK ERADICATION.

An effort has been made to secure direct evidence from cattle men and farmers regarding the benefits to the cattle industry of the South which are being derived from the tick eradication work carried on in co-operation between the Bureau of Animal Industry and the United States Department of Agriculture and the various states within the quarantined area. Accordingly a circular was sent out from the local headquarters of the Bureau of Animal Industry at Nashville, Tenn., to a large number of representative stockmen and farmers in that section asking for replies to eight specific questions concerning the results of the work up to date.

One hundred replies have been received, and the information contained therein has been condensed and averaged as below. Of these replies 13 came from Alabama, 45 from Mississippi, 24 from Tennessee and 18 were not located.

It is hoped that the striking results indicated by these reports will act as an incentive to all concerned to push the work of eradication more vigorously than ever.

The questions and a summary of the replies to each follow:

Question. What were the approximate losses from tick fever in your county for the ten-year period from 1900 to 1909, inclusive?

Reply. Fifteen and three tenths per cent or 895 head.

Question. What was the approximate annual value of all the cattle that died in 1900 to 1909?

Reply. All the way from $150 to $50,000 with an average of $5,880 per annum per county.

Question. What has been the annual loss of cattle from tick fever since inauguration of tick work?

Reply. One and three tenths percent or 20.3 head.

When the averages are compared with those of the first question it will be seen that the losses have been reduced almost to the vanishing point since tick eradication has been in progress.

Question. What was the average value of three-year-old steers in your county from 1900 to 1909, inclusive?

Reply. Price per steer (average), $16.15, or price per pound, 2¾ cents.

Question. What is the average present (1911) value of three-year-old steers?

Reply. $25.28 per steer or (per pound), 3½ cents.

On comparing these values with the results of question 4, it will be seen there is an advance of $9.13, or 57 per cent, in the price per steer, and of 1¼ cents, or 56 per cent, in the price per pound. However, not all of this increase can be attributed to the tick eradicator work, because of the general advance in the price of cattle which has taken place in recent years.

Question. Is there any difference in the average weight of cattle now and before tick eradication was started? If so, how much?

Reply. Twenty-two per cent, or 115 pounds.

Question. Is there any improvement in grade of cattle in your county since the work of tick eradication started?

Reply. Over 90 per cent of the replies, report improvement in the quality of the cattle resulting from the work of clearing ticks, and a large number say the improvement is very marked and that it is increasing. A few reports from territory recently cleared, state there has already been time for the conditions to change. Four of the replies deny that any improvement has taken place.

Question. Do you use cow manure as a fertilizer? If so, state the relative productiveness of land with similar land on which it is not used.

Reply. Nearly all the reports were enthusiastic about the value of cow manure as a fertilizer. One said it increased the crop from one to five times, depending upon the amount used; another went still further, saying the crop was increased from two to six times. Six only of the 100 correspondents reported that they did not use it on their land. Upward of 50 per cent of the writers stated that the productiveness of the land was increased 100 per cent or more. The remainder claimed benefits of a lesser degree.

The following is a copy of the remarks appended to a report received from Hinds county, Mississippi:

With the prospects of tick eradication the raising of cattle is springing into life. In years gone, with the tick depopulating bunches of cattle, there was no money to be made in raising cattle. With the present outlook men are fencing their lands and there is sharp competition for every heifer, or cow that can be bought. Improved breeds are being sought and registered bulls brought in. If our authorities will pass a tick law and see that it is rigidly enforced, we can clean out the ticks in twelve months. In five years from now our pastures will be full of high grade feeders, and the sale of car loads of such animals will be an ordinary occurrence. Even now I hear farmers talking of raising corn by the 1,000 bushels and having cattle of such breeds that it will pay to feed the corn to them. All this is mute testimony to the great good that is resulting to our people, springing mainly from the efforts of the National Government.

ONE ANSWER—KEEP A COW.

A lot of fair minded people would take more stock in the agitation of the dairy interests against the oleomargine business, if the creamery men did not proceed to hold up the people every time they think they have oleo temporarily out of the running. Following modern prices in the fall, the consumption of butter was growing famously until the coming of severe weather gave abundant excuses for jumping prices time and again. Just how much butter had been stored for this harvest we do not know, but in a little while 50-cent butter was staring Mr. Ultimate Consumer in the face. Just at this juncture the pages of the press blossomed with advertisements telling how "lickin' good" some "margarine" would taste with butter tasting so much like money. It is said the packers sold out their surplus, in addition to a very heavy month's production, while retail butter figures slid off about 40 per cent.

Then we reflected how fine it was that the people should be protected by this competition between big interests—until some one suggested that the "food trust" controlled both, and that the butter was all sold out at the top before the oleo came into the spot light!

There is no help for it when a victim can operate single handed but keep a cow.

Though we live in hopes that the remedy may be found through the ballot.

EXHIBIT NOT EASILY MATCHED.

One of the exhibitors at the Feeders' and Breeders' Show is R. D. Williams of Callahan county, who has 32 pure bred Red Polls and Polled Durhams. Mr. Williams might make another exhibit that would be more interesting. He is the father of eight boys, the oldest just 21. He has a large photograph of seven of them, each astride of a horse. The youngest is not in the picture because he is too young to sit a horse.

"I have never taken a drink of intoxicating liquor in my life, and I am raising these boys the same way," says Mr. Williams. "Not a one of them has ever tasted such liquor, or smoked or chewed, and I have a standing promise of a gold watch for each of them upon his reaching 21 years without breaking our family rule, and from present indications I am going to have to buy eight watches."—Fort Worth Live Stock Reporter.

Great Shorthorn Offering

40 head of high classed Scotch and Scotch topped cattle

HASTINGS, NEBRASKA, MAY 1, 1912

This offering will consist of 18 bulls and 22 females. The bulls are a strong, serviceable lot sired by such bulls as Champion Goods, Improved Goods, Roan Goods, Parkdale Champion, Victor Archer and others. A number of these are of show-yard character and good enough to head any herd. The females are a splendid lot, carry plenty of scale and quality, and represent some of the best Scotch and Scotch-topped families of the bseed. They are either well along in calf or will have calves at foot by Improved Goods, Roan Goods or Champion Goods. Every animal going in this sale has a life of usefulness before it. For catalog address,

R. C. FIRME, Hastings, Nebr., or A. A. STONE, Hansen, Nebr.

Auctioneer—Col. George Bellows.

S. C. HANNA H. M. HILL FRED COWLEY

10TH ANNUAL PUBLIC SALE
SHORTHORN CATTLE
50 HEAD INCLUDING 14 BULLS

This sale of prime breeding cattle is made up almost altogether of descendants of that great bull, Imp. Collynie, and includes about the last of his bulls.

The old bull was sent to market last December after fourteen years of unusually useful life, with his constitutional vigor unimpaired, but while still active he had failed to settle his cows for several months. This great breeding sire has passed but Shorthorn history will be richer because of his descendants which number into the thousands for these descendants has inherited the ability to go on—and are demonstrating their usefulness under conditions and with feed and care that are possible on every stock farm in the West.

The writer, who has been making numerous visits to Mr. Hanna's farm for nearly twenty years past, was recently there and does not hesitate to say that the young things now coming to maturity there are the most sappy, growthy and altogether uniform lot from the standpoint of individual existence ever offered from Palo Duro.

When old breeders, young breeders, or new beginners can have the opportunity of selecting from such a lot of cattle of one type—faultlessly bred, with the prestige of the best breeders of America and the British Isles attached, and at the present low prices, it would seem that they were surely getting in on a safe basis.

The breeder-farmer or stockman should employ pure blood in his livestock in order to make more profitable use of the ordinary farm crops, and he must have livestock that has been bred and developed in a practical manner.

This selection of choice cattle from these established herds will convince anyone that these breeders are not following fads, but are paying strict attention to utility and the results shown in the uniform excellence of this consignment will please practical men.

A neat catalog, giving full tabulated pedigrees for five generations, is ready to mail and may be had by application to

H. M. HILL, Lafontaine, Kan.

Sale to be held at Fredonia, Kan., April 10th

SECOND ANNUAL SALE

LAWNDALE SHORTHORNS

IN THE FINE STOCK PAVILION

KANSAS CITY, MO.
THURSDAY, APRIL 11

48 HEAD--47 FEMALES--ONE BULL

Twelve calves at foot sired by Silk Goods and Scotch Goods, 18 yearling heifers, 29 females from 2 to 4 years old. Scotch Goods, a 3-year-old son of Silk Goods, by Choice Goods, is included in the offering. Let us show you the wonderful cattle in this offering. Practically all young cows and heifers, that are great milkers, and true to the modern type of beef cattle. The sale catalogue gives full information regarding each animal in the sale. Ask for it. Address,

MRS. A. FRASER, F. H. GLICK, Mgr. ARGYLE BLDG. **KANSAS CITY, MO.**

One of the points made by Prof. Hopkins in an argument to show that stock farming is not "all that it is cracked up to be" is that even with the help of many papers boosting for animal husbandry, it is not gaining on grain farming, which has little boosting of this sort. Without allowing one way or the other for the fact that some stock paper "boosting" is ill considered and of doubtful effect, the answer to Prof. Hopkins' contention is found in the universal tendency toward adoption of methods which bring quick apparent benefits, even though the ultimate result is bad. It always has been the work of the far seeing, and of the newspapers or other agencies which give circulation to their utterances, to combat this downward tendency, and their presence in the struggle proves the righteousness of the cause, and not a weakness.

THE ASSOCIATION OF COUNTY FAIRS.

At the second annual meeting of the Missouri Association of County and District Fair Managers constitution and by-laws were adopted and an annual membership fee of $5 to each association was assessed.

The officers elected were as follows: President, J. Allen Prewitt, Independence, Mo.; vice-president, Mr. Jack Harrison, Auxvasse, Mo.; treasurer, B. E. Hatton, Columbia, Mo.; secretary, E. A. Trowbridge, Columbia, Mo.

In a much appreciated address, President Prewitt spoke in part as follows: "County fairs have been organized on the entertainment basis to a great extent. This soon becomes tiresome to directors and others responsible because the people do not appreciate it. The county fair must be made a vital permanent and serving institution if it is to command respect and patronage from the public. To do this, means must be provided for their support. County fairs should have permanent paid officials. Probably the secretary, who will devote all of his time to the fair and its working and other matters in connection therewith. It is the place of the county fair to teach road building, elementary agriculture and elements of conservation. Such a school might operate during the winter to close March 1, the boys and girls to go home, practice what they have learned in growing crops and live stock and caring for homes, come back to the county fair in the fall with an exhibit of their own work which will be the result of their education at such a school. They will compete for prizes offered by the association at a county fair. This brings up competition, creates interest and will ultimately, if properly managed, grow into a monstrous school."

ANOTHER BIG JACK.

To The American Breeder: Here is the description of a three-year-old jack I have: Black in color, with white points, 16¼ hands, Standard measure, 74 inches around the heart, 77 inches around the flank, 24 inches around the arm, 16 inches around the knee, 10 inches below the knee, ears 35 inches. It is too muddy to go and weigh him, so I guess he is big enough. S. M. Myers, Knox county, Missouri.

LIVE STOCK SHOW AT FT. WORTH

Texas has led every other Southern state in its recognition of the value of draft horse blood to the farmer. This is well illustrated by the interest in the annual March exhibition of draft horses at the live stock show in Ft. Worth. The show this year was no exception. Percherons were best represented of the drafters. Among the well known importers who helped make this part of the show were J. Crouch & Sons of LaFayette, Ind., and Oltmann Bros., of Watseka, Ill.

The champion car load of fat cattle at the Ft. Worth Stock Show sold for $10.75 a hundred, or $2.50 higher than the champion load sold a year ago. The champion steers were Herefords, shown by J. W. Cook & Son, Beeville, Tex. The single grand champion steer was also a Hereford, by the name of Bill, and was shown by C. M. Largent, Merkel, Tex.

In the breeding cattle classes a few herds from the North were represented, but for the most part Texas exhibitors made the show. The Shorthorns and Herefords made the largest showing, as usual.

The hog and poultry exhibits were distinctly of the home state and proved that both in the interest felt and the standard maintained, conditions in these branches of animal husbandry are good.

The "Cattlemen's Convention," which was an important feature of the week's doings will be held at El Paso next year. The following officers were elected by the Texas Cattle Raisers' Association:

President, Al McFaddin of Victoria; first vice-president, Joe D. Jackson of Alpine; second vice-president, John Landergin of Vega; secretary, E. B. Spiller; treasurer, S. B. Burnett; honorary vice-presidents, Ike T. Pryor of San Antonio, W. W. Turney of El Paso, A. B. Robertson of Colorado City, James Callan of Ft. Worth and Ed. C. Lasater of Falfurrias.

The association went on record against free trade in live stock and meat products.

The students' judging team from the A. & M. College of Oklahoma won first honors in the students' judging contest. Arkansas and Texas were the other states represented and finished in the order named.

A JACK QUESTION.

To the American Breeder:—I would like to ask the readers of the American Breeder if there is more danger of a jack straining himself serving a mare out of the pit than there is by using the pit, and if the jack is tall enough, why use the pit at all. Wouldn't a mare be apter to get in foal by not using the pit, if the jack is tall enough?—C. F. Jessup, Green county, Indiana.

A GOOD 8 MONTHS COLT.

To the American Breeder:—My neighbor has a mare that he carried 15 miles and bred her to a jack on July and she foaled a live mule colt on March 22, and from the way the colt looks it was at its full time.—J. C. Henderson, Grant county, N. M.

SIXTEEN COLTS FOR THIS MARE.

To the American Breeder: Noticing William Rawlings' record for produce of mare, will give you record of a mare I own which I think has him beat. My mare is 19 years old, being foaled the last of June, 1892. She has always been worked and is still working, and seems to be as good as ever. She has just foaled her 16th colt, and has raised all of them. Never has had twins; has had four horse colts and 12 mares. If anyone can beat this. let's hear from them.—Ed. H. Magowan, Buffalo county, Neb.

GOOD FROM ALL ANGLES.

To The American Breeder: Will say that I like your paper the best of any horse journal I ever took, and I have taken five different horse papers. My ad. in the paper this winter sold my horse profitably. He went to Grafton, West Virginia. Since then I have lost my jack. The veterinary said he was too fat; too much so around the heart. He died the 14th of this present month. He was a large Mammoth jack, would have weightd 1,200 pounds when first taken ill. He was raised somewhere in Illinois. L. A. Flint, Route 2, Wabash County, Indiana.

Irrigation will bring maximum crops while the land is new and full of plant food; but where the crops are sold year by year, irrigation will not of itself assure good results.—From the 1911 report of the United States Secretary of Agriculture.

Lafayette County Jack Farm

I have twelve big young black jacks that I am going to sell at some price before May 1. Five of these jacks are 15½ or over. These jacks were too thin to put in my last public sale. Come at once.

Also 14 imported and home bred registered Percherons that must sell soon. These are good big sound young horses.

I want to clean up and will make prices to move this stock.

W. J. FINLEY, Proprietor, Higginsville, Lafayette County, Missouri.

Missouri Registered Mammoth Jacks AND JENNETS

FOR SALE AT ALL TIMES.

As fine a bunch as can be found on one farm. Guaranteed as represented. Prices right. Come and see them.

J. T. Watson, New London, Ralls County, Mo.

PREMIUM JACK, KENTUCKY JUMBO.
Black, white points; won second as yearling, second at two years, all ages competing; first at three years; first at four years, all ages competing; 5 years old; 15¾ hands, jack measure; big head and body; heavy bone; 70-inch heart and flank, when fat. Good performer on mares and jenets, all O. K. Price $1,500. No horse trade on this jack. Have smaller jack; black, that will trade for draft stallion, black or bay, or good draft mare. Also one saddle bred stallion, 16 hands; 7 years old; brown; three white feet. Price $400, for immediate acceptance. **P. H. Vories, Sparta, Gallatin County, Ky.**

LIMESTONE RIDGE FARM.
Have on hand an outstanding good lot of stock. One saddler and two registered Percherons; a number of good Mammoth jacks, Kentucky and Missouri blood; good color; 14½ and 15½.
The right kind and the right price so they will look good in any breeding barn. Proved breeders and prompt to serve.
If interested in good stock and low prices write **Isaac C. Lohman, Turney, Clinton County, Missouri. R. 3.**

KINGFISHER VALLEY STOCK FARM

A fine assortment of Registered Black Mammoth Jacks, up to 16 hands high, good bone and body. Terms and prices reasonable. Address, **J. H. Smith, Route 3, Box 17, Kingfisher, Kingfisher County, Oklahoma.**

Carl Lindstrom, Vinland, Douglas County, Kansas.

TWO BLACK TENNESSEE JACKS.
15 hands; 5 years old. Work well; colts to show. Price $500 and $900. Would trade for draft stallion or jennets. **John Oesch, Sr., Garden City, Cass County, Missouri.**

AMONG THE BREEDERS

POINTED BREEDING CAPSULES.

Every spring we receive hundreds of inquiries as to the kind of capsules used in capsule breeding. There is only one kind that should be used; they are the pointed breeding capsules. The Kansas City Impregnator Company has expended a lot of money experimenting on capsules for breeding, and they have developed a special capsule made of the best quality, with one end pointed so that they are easily inserted. They manufactured a lot of these for the last spring trade, and they were very satisfactory. We announced last spring that these capsules were on the market, and within a very short time the entire supply was exhausted. This year they have made up a lot of these capsules, but as the demand for capsules is growing so rapidly we would advise all breeders who expect to use these capsules to send their order in for them soon, to be sure to get the right kind. The demand will be very extensive, as hundreds of new breeders write us that they will use the capsule system this year.

In the saddle horse and jack sale of Dr. W. E. Cheatham, report of which was crowded at the time, three colts by Rex Donnell, from 7 to 8 months old, sold for $500, $600 and $500. A 3-year-old jack, Mammouth of Oakes, was knocked down to Griffith Bros., of Orrick, Mo., on a bid of $2,925, the top for the year. Excelsior Giant, a three-year-old, went to Ed Boen, Lawson, Mo., at $1,075. Mr. Boen also bought Hannibal King for $700. A gray jennet, Silver Leaf, sold for $800 and all others while selling lower, seemed to sell well.

Truman's Pioneer Stud Farm of Bushnell, Ill., writes: We had the pleasure of a visit this week from two of the leading draft horse breeders of Edgar County, Illinois, L. M. Tate and Charles T. Payne. Both of these gentlemen are old customers of ours and own choice imported Shire mares. Mr. Tate selected Toft Dandelion, a beautiful dapple gray Shire, rising four years old weighing 2,200 pounds, and will be a great addition to the draft horse interest of Edgar County. Mr. Payne selected an imported dark bay Shire stallion, rising six years old, weighing around 2,100 pounds, full of quality and a strictly high class horse in every particular. Another old customer of ours, Mr. M. J. Nelson, of Story County, Iowa, selected an imported gray Percheron stallion, rising three years old, weighing over 2,000 pounds. To Tom Egenes, of Polk County, we sold an imported Shire stallion, rising three years old, weighing over 2,000 pounds. The Money Creek Horse Company, of Houston County, Minnesota, selected an imported rising four year old gray Percheron stallion, weighing 2,175 pounds, winner of second prize at the Iowa State Fair last fall. Our old friend and customer, W. T. Fancher, of Keokuk County, Iowa, selected the noted prize winning imported Shire stallion, Roscote Premier, one of the best Shire colts shown at Iowa State Fair last fall. This is the fourth stallion that we have sold Mr. Fancher. Messrs. Cox and Thompson, of Brown County, Illinois, selected a black imported Percheron stallion, weighing over 2,000 pounds. Swan Nelson, of McDonough County, Illinois, purchased a high class imported Shire mare as foundation for a pure bred stud of Shire horses. To J. C. McNare, of Cherry County, Nebraska, we sold the imported black Shire three year old stallion, Brinsworth Drayman. He will be remembered as winning first prize in the two year old class at Iowa State Fair last fall, his dam being the International champion, Shelford Pride. This same gentleman purchased an imported Shire mare. This purchase will greatly improve the draft stock of his county. Charles Echternacht, of Guthrie County, Iowa, purchased a rising three year old imported Percheron stallion. A. Ray Spangler of Marshall county, Illiois, bought of us an American bred Shire stallion. We still have an extraordinary large selection of high class Shire, Percheron, Belgian and Hackney stallions to show our customers. It is a well known fact that we are never sold out.

Taylor Jones, Williamsville, Ill., writes: We are indeed glad to see so many of our old customers coming in to buy more horses. Among our recent sales are: C. E. Walker, Shelbyville, Illinois, third horse bought of us; B. F. Fletcher, Dalton City, Illinois, second horse bought of us. You will remember Mr. Fletcher is the man to whom we sold the champion Percheron stallion, Ibsen. Mr. Fletcher is probably the only man in the United States having three champion stallions standing for public service. S. C. Longwalter, Lebanon, Illinois, second horse bought of us; Henry Williams, Buffalo, Illinois, sixth horse bought of us, and A. S. Hartmann, Tuscola, Illinois, second horse bought of us. Our horses are all doing well and we have a nice lot from which buyers may select.

W. W. Shott, Lathrop, Mo., offers to save anyone looking for a first class jack or stallion $100 on each animal if they will purchase right with anything mentioned in his ad. He is selling very high class stuff and our readers will no doubt be able to purchase some great bargains from him if they are interested in anything in his line. Mr. Shott is only twenty-nine miles out of Kansas City and we would advise those who are interested to correspond with him and get prices.

"All Percheron stallions recorded and sold under a written guarantee, with terms to suit," is the advertisement of Singmaster and Walker, Union Stock Yards, South Omaha, Nebraska.

Priced to Sell

Oscar Edwards & Son of Hillsdale Stock Farm, have some choice saddle stallions and mares. A couple of Percherons, and some of the best jacks and jennets that grow. Shew stuff and prospects. Guaranteed to be as represented. They breed Duroc Jerseys, too. Write them. **Box 402. De Soto Jefferson County, Missouri.**

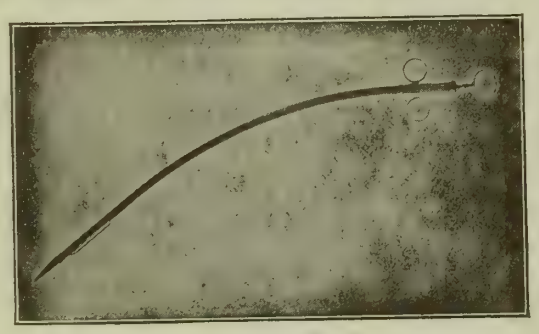
W. H. Wheeler, Garden City, Kas.

Breeding Appliances of All Kinds



Bending the Soft Metallic Point of the Carlson Semen Extractor After B eing Inserted in the Uterus (Womb). The Neck of the Womb Will Bend to Meet These Conditions Without Injury.

The Carlson Semen Extractor and Capsule Syringe

Which can be used as an impregnator or for getting the fluid out of the vagina or uterus for filling capsules. This is the only way to use capsules successfully as 60 per cent of the services inject the semen into the uterus where it cannot be obtained otherwise. The syringe holds 8 ounces of fluid. This instrument is being used successfully by thousands of breeders. It is made of the best metal and can be taken apart easily and boiled, which is the only way breeding instruments can be properly sterilized. As shown in the illustration above, it has a soft metallic point at the end, which can be bent in any direction after it is inserted into the uterus. This is the only instrument that can be used for getting the semen out of the uterus. All necessary directions telling how other breeders are using the Extractor sent with each order.

Price $5.00 For a Limited Time.

Curved Metal Impregnator

This instrument is sold by other dealers for from $5 to $6. It is nickle plated, about 22 inches long, with a glass tube in it. Price $4.00.

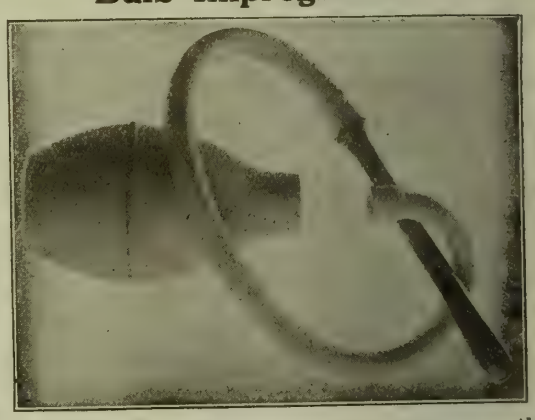
Microscopes

For use in testing the semen of stallions or jacks. Made especially for this purpose. Magnifies 500 times and is used by veterinarians and physicians. Price $35. Boxed in fine case. These instruments are of great value in the breeding business. Through them you can see for yourself and show your mare owner the live spermatozoa of your sire.

Thermometer

Tested and used for keeping water at the right temperature.

Price 75 Cents.



POINTED Breeding Capsules

We have the only capsules made especially for horse breeding. Some capsules do not dissolve, leaving a foreign substance in the uterus which will prevent conception. Other capsules are too flimsy to use for this purpose. You cannot make any mistake by buying capsules from us as we only have one kind. We have them boxed with 100 in each box. The box is tight so they will be clean. These capsules are properly baked and all bacteria killed before they are mailed. Always keep the lid on the box when not in use. Price per box (100) $1.50

Directions for Ordering

Send money orders or draft as exchange is always charged on personal checks. Always name your express office as well as your post office address in order to insure prompt delivery.

Bulb Impregnator

This is the best bulb impregnator on the market. Some dealers sell for $5 and $6. Price $2.

Breeders' Bags

Three sizes, small, medium and large. Stallions weighing 1,200 to 1,600 pounds usually require a medium size. These bags are guaranteed not to tear from any cause before March 1, 1913. If they do tear before that time return the top part with our stamp on it and 35 cents in cash and we will send you a new bag. Price, Each, $1.00.

Speculum

Made of good material, nickle plated, easily inserted, will last a life-time.

Price $3.00.

Emasculator

This emasculator (improved style) is made by the Kny Scheerer Co., and bears their trade mark. It is guaranteed to give satisfaction. If it breaks within one year or gets out of order, return it and get a new one. This instrument is made of the very best steel. It is the latest method, only having three pieces and can be taken apart very easily and thoroughly sterilized. It operates perfectly. Price, $7.00.

Veterinary Thermometers

This thermometer is recognized and used by the leading veterinarians for taking the temperature of animals. It has a metal case which insures it against breaking and will last a life-time. It has a small chain with pin in it that may be fastened to the vest pocket and carried with safety. Price, $1.25.

POSTAGE AND EXPRESS PAID ON ALL ORDERS.

Seven Thousand Dollars Worth of High Class Stallions Provided for One Nebraska Community, as a Result of Capsule System Profits. :-: :-: :-: :-:

Graham Publishing Company, Inc., 225 West Twelfth St., Kansas City, Missouri

Imprecation

The sensational prize winning Percheron stallion, IMPRECATION (79214) 79304, imported by us in 1911. Gray horse, foaled April 24, 1908. Weight 2,200 pounds.

First prize winner, three-year-old class, and grand champion stallion at the International Live Stock Show, Chicago, 1911, and the ONLY HORSE IN AMERICA HAVING THE DISTINCTION OF BEING SUBSIDIZED BY THE FRENCH GOVERNMENT for use in France.

As a large number of breeders of pure blood Percheron horses are desirous of breeding to this great horse, we have decided to accept a limited number of approved mares for the season of 1912, at our farm, Lafayette, Ind.

TERMS.

$100, cash at time of service, to insure mare in foal. Should mare fail to prove in foal, she may be returned free, or breeder may substitute another mare free of charge; and if horse should be sold, or not in our possession at the time mare is returned, money will be refunded.

Mares sent here will be carefully cared for on pasture, free of charge, and if fed grain, reasonable charges will be made. We will not be responsible for accidents.

All who want to take advantage of the opportunity to breed to the "GREAT CHAMPION" should write us at once. Picture and breeding of IMPRECATION sent on request.

We have 100 to 200 head Percheron, Belgian, German Coach and Hackney stallions and mares always on hand.

J. Crouch & Son, Lafayette Stock Farm, Lafayette, Indiana.

Imported Percheron Stallions

AT REASONABLE PRICES.

We have a large number of imported Percheron stallions and mares brought over last August, and will price them to you on **LOW MARGIN OF PROFIT.** We have cards, post cards, made of our animals and send them out on request. We also have newspaper folders of the entire shipment and would be pleased to have you ask for them if you feel interested. We are **FARMERS, BREEDERS** and **IMPORTERS** and will accord you fair and gentlemanly treatment if you deem it to your interest to give us a call.

HUNTINGTON INDIANA

TAYLOR & JONES

STALLIONS

Stallion buyers, why do Taylor & Jones sell more horses than almost any of their competitors? If you will stop to think, you will certainly know their horses must be better, their prices lower and their guarantee as good as can be written, as every man wants the best value for his money. We can please any customer in either Percherons, Shires or Belgians.

Our first importation in 1912 has just arrived at our barns and in the lot are many high class stallions, and as there has been no great expense on them as yet in the way of feed, care, risk, etc., we can sell them worth the money. If you are looking for a good horse, come and see us.

How Grade Jacks are Recorded

The Biggest Jack Registry in the World Grew in Four Years on the Right Foundation, While One With Wrong Standards Serves Comparatively Few After 24 Years.

WE wish to state in the beginning that the information on this subject has not received extensive publicity. There are many who have been laboring under wrong impressions. Some of the statements contained in this article may not please everyone, but it is prepared for the information and benefit of the jack breeders. There are no jack registry associations in the world which are recognized by the United States government, and every jack registry in the United States registers grade jacks. Every jack registry in the United States has registered the off-colored jacks.

On September 17, 1888, a few jack breeders assembled in Springfield, Ill., and started what is known as the Ameircan Jack Stock Stud Book. A set of rules were adopted, which admitted all jacks 14½ hands high and all jennets 14 hands high, standard measure. Nothing was said about color in these rules until several importers, woh were dealing in black Spanish jacks, wished to place a premium on that color of jacks. There were not many black jacks in the country at that time, and it was easy for these men to select black jacks and sell them here at a good profit. This was the start of the great education of the American farmer to black jacks Up to this time there were many valuable gray, Maltese and brown jacks in this country. In fact the first Spanish jacks imported were Maltese.

After the importers were able to change the rules of the stud book to admit only black jacks with light points, 14½ hands high, and black jennets with light points 14 hands high, that association seems to have benefited only a very small number of men. It has stood wide open, with these measurements and color as the only necessary qualifications, for nearly twenty-four years, so that any one could register a jack or a jennet filling these simple requirements—provided they happened to know about the rules. But when the Stallion and Jack News printed these rules, with a view to letting more people know, thus increasing the partonage of that association, protests were soon coming in, from those who did not want the public to know that these simple requirements existed. This association, during its career of nearly twenty-four years, with these simple requirements, so that blood lines were not essential, and without requiring even an affidavit, has made comparatively little growth. There are about 2,000 live animals registered in the association at this date, with probably 700 of that number females. A very small number of them show any blood lines.

The question is, can any live stock association prosper unless it makes united effort on behalf of the breeders of its particular class of live stock? If an association, standing wide open, with only the few restrictions we have named, could not accumulate more than a corporal's guard of live stock, during almost a quarter of a century, what inducement is there for anyone to patronize such an association? It is true that a number of men have made money out of this registry, by buying unregistered jack stock and having it registered. The public knew little about the requirements of this association. If an animal was registered and showed the name of several ancestors, it was accepted as having something superior in the way of breeding. But of what value is a registry conducted a sthis has been?

We have no fault to find with a good, black jack. We only wish there were enough really good ones to supply the demand, but there are not, and there never will be as long as the premium is placed on the black color. We believe that every good, big jennet should be raising jacks for the market, for if the demand continues to grow as it has for the past few years, the big jacks will be too scarce to supply the demand, and little ones have no value whatever, regardless of color.

There are more good jacks in the United States than can be found in the rest of the world. We have little use for the so-called imported jacks. The only ones that would add any value to the live stock in this country are too high to bring here from France and Spain, except in a few cases where they might be purchased for heading herds. The writer has visited nearly every jack breeding district in the world, so that he might familiarize himself with the jack situation in all countries. Many of the best jacks in France and Spain are not even of a dark color. The jacks that produce the largest mules as a class are the Poitou jacks found in the southern part of France. These jacks are bay, brown and black, and measure about 14½ hands in height. They have heavy bodies and good, big, strong limbs. A jack should have a reasonable height, but the system under which jacks have been registered—requiring only a certain height—has, in our opinion, caused many of our jack breeders to forget everything else except height and color.

Constitution should be one of the principal requirements in all beasts of burden. The demand for tall jacks has had much to do with injuring the constitutions of our jack stock, to the extent that many of the colts are very difficult to raise. This has greatly retarded jack production, as it has injured the jennets to the extent that they are not as good producers as they should be. A campaign should be started for the well proportioned type of jack, with plenty of body and bone. The only thing for which jacks are raised is the production of mules, and the leading mule men inform us that it is not the number of hands in height that brings the most money but the well proportioned mules, and the larger the better. The men most capable of knowing what kind of jacks should be used for mule production are the men who buy the product. Some time ago several of the leading mule men of America were interviewed on this point, and the following signed statement made by them shows clearly that you will have to have something more than height and color if you want to realize good prices when you get to market:

WHEN THE EDITOR WAS IN THE JACK BUSINESS.

TO ALL MULE RAISERS.

We, the undersigned, want to encourage mule raisers to raise good mules, with quality, plenty of body and bone, regardless of color; instead of the tall, rough mules. Too much value has been placed on the number of hands high; you should raise better proportioned mules without so much daylight under them.

What the jack breeders of this country need is an association that requires well proportioned animals as foundation stock, regardless of color. There are thousands of excellent jacks and jennets that could be used to good advantage as foundation stock. A reliable jack record is just as essential as are reliable registers for any other stock, but the association, to be a success, cannot be run for the advantage of a few men. All jack breeders must have the same opportunity.

In 1908 a number of leading jack men got together and asked Frank B. Graham to start a record association. After considerable investigation a set of rules were formulated, application blanks were sent out, and the association, named the Standard Jack and Jennet Registry of America, was put under way. This association has today more registered live jacks and jennets than all the other jack registers in the United States combined, and their average standard of excellence is higher. Every jack breeder has had the same opportunity to use this registry. Many applications have been rejected, and we believe the records in this registry are as correct as can be found in any registry.

It was not the intention of Frank B. Graham, when he started this association, to continue it, as his own property, but that it should be turned over to the jack breeders with all the profits accrued, and this will be done in the near future. He has worked nearly four years without receiving a dollar for his work and efforts, neither does he ever expect to receive any profit from it, except to help the jack breeders to establish an authentic and practical registry of jacks and jennets. This association belongs to the jack breeders of America, and each of them has a voice in its management. It is soon to be incorporated and Frank B. Graham will not have any office in it under any consideration. Every officer, excepting possibly the secretary, should be a jack breeder, and own a good bunch of jennets. The plan is to have at least a dozen directors scattered over the United States, where jacks are bred extensively. We want each jack breeder to write to Frank B. Graham, and name men whom he wants for directors of this association. Those elected by this vote will be the directors.

The Standard Jack and Jennet Registry of America will not injure those who have registered in the other associations, as it is quite probable that the officers who will be elected will accept, without any fee, all animals from other records, that will meet the requirements of the Standard Jack and Jennet Registry of America. This is now the largest jack registry in the world, and there is no reason why it should not continue to grow at an increasing rate.

Dr. L. W. Knight, who prepared a history of the foundation jack stock in America, states that color should have no place in a live stock registry association, and we believe he is right in this statement. Two of the largest registry associations in the world have had their color troubles—Percheron and Shorthorn. Every color craze that has been started in these associations has been injurious to the breeders.

What the Ameircan people want is an animal that will meet the requirements of the use for which they are intended.

It would require many generations to perfect a breed of jacks that would all be black with white points, in this country, as three-fourths of the foundation stock were of other colors 25 years ago, and these colors will continue to crop out for many generations. The Jack Stock Stud Book requires all animals to be black with white points, and even though the sire and dam were both registered the offspring could not be registered unless it was black with white points. It would be a great sacrifice to any jack breeder to raise a good big jack that happened to be an off color, and not be allowed to register him.

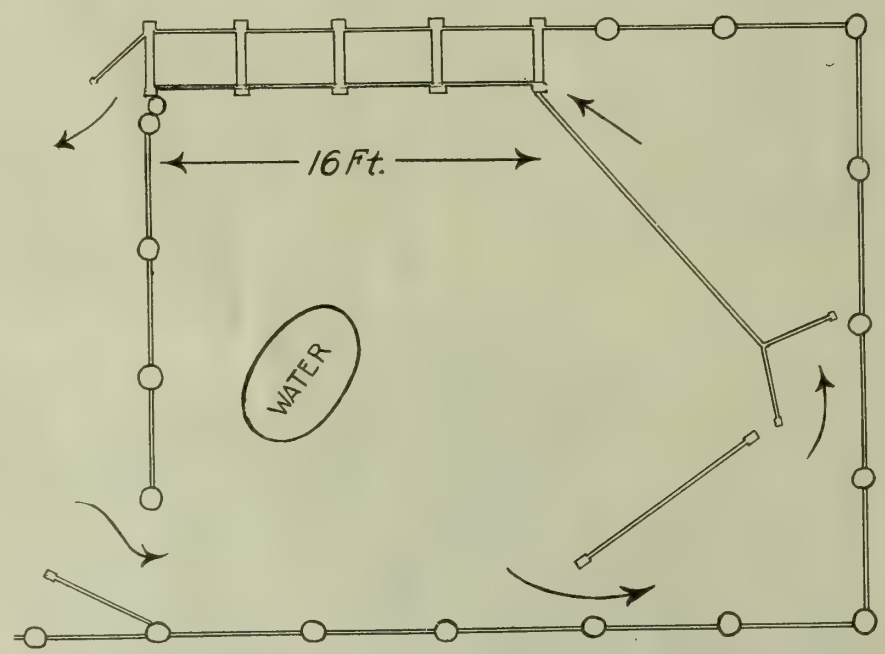
The Standard Jack and Jennet Registry of America will not interfere with the black color in the least, as it is quite probable that every jennet will be bred to a black with white points, because the demand is for that particular color. Anyone that wants a black jack can have the same opportunity that they now have, but we contend that if only black jennets are used in a registry, and the public is educated to use only that kind of stock, the supply cannot meet the great, growing demand, and inferior animals of the accepted color will be too much used. We believe it is better to use a good big jack of any color that will produce big mules, than to encourage the farmers to use little, scrawny jacks in preference, because they are black with white points.

Some of the best mule producers in the country are not black with white points. It is impossible to control the color of mules, even if all the jacks were black for many generations, as the mares on which they are used have as much influence on the color as the sire. Furthermore, there is little difference in the mule market so far as color is concerned. In some cases the steel gray mule is preferred. Two or three Southern states require mules to be black with white points, but these are the little cotton mules. For commercial mules for the trade all other states demand mules of quality regardless of color. What jack breeders want is size, with plenty of body, bone and constitution, and a lot of the spindling stuff without sufficient bone, body and constitution, should not be recognized or encouraged, for they are detrimental to the live stock industry.

There is too much stress paid to the breeding of black jacks. There is not one jack in a thousand that produces all black mules, and not half of the black jacks produce one-half black mules. Many of our best black jacks are not being patronized by some breeders because there are occasional off color mules. The extreme education for black jacks is injurious to the jack breeders. As a rule, if a black jack does not produce all black mules some of the breeders, knowing very little about the rules for registering jacks, say that the animal is not pure bred.

Even though the mules of an off color may be better and sell for more money, yet they will contend that a jack is not pure bred and that there is something wrong with his breeding. These complaints will continue to come for many generations, if the American farmers are educated that all jacks must be black and their produce black to be pure bred.

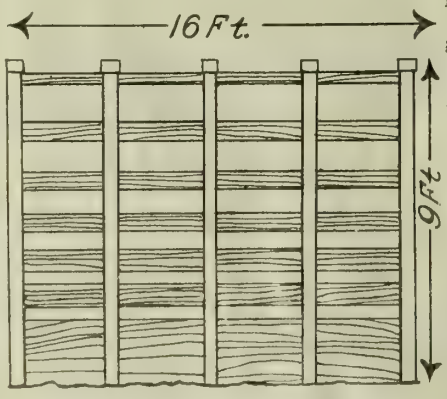
We want the jack breeders to study this proposition. It means money to them, and it means millions of dollars to the mule industry. Good, big, young jacks never sold higher than they have during the last few months, and they are bound to increase in value. The writer has purchased 14 two and three-year-old jacks during the past few months for his friends, and they averaged over $1,200 each.



Let us all work together for the best interests of the jack breeders, and produce bigger and better jacks that will sell for more money and make a better profit. Let us try to encourage the constitution of our jack stock stuff, so that the jennets will produce with more regularity and that the colts may live to maturity, and that the breeder may not be compelled to sacrifice a good individual because he bred back several generations, and showed the original color of some good ancestor.

Mr. Jack Breeder, will you lend your influence to help yourself and all the jack breeders, or will you assist to perpetuate a proposition that will benefit only a few? "United we stand, and divided we fall."

A CHUTE FOR BREEDING RANGE MARES.



To The American Breeder: I am enclosing a design of a chute which was asked for by an Oklahoma reader, in the last publication. If this is not too rude a structure it may be of some help to him in making one. In this cut the chute is based on using 16 foot stuff and the uprights are to be four feet apart. Put all lumber on inside of posts except the 2 by 4's on top. Put them on outside.

Under the gas pipe bar which goes through the holes shown in the 2 by 8's of the chute you can hang a small door, which will protect the operator from being kicked. When you breed a mare in this chute and open the door she is gone to the outside and not mixing up with your other stock. Having the watering place in the corral is quite an advantage in your favor. Mares will come in to drink and you can shut them in without running down a saddle horse. By hanging the gate in the crowding pen as shown you have when it is open two angle fences to help you pen them. I have put in a part of most of the seasons for the last eight years. In most all places to get the mares in the crowding pen has been the big trouble. Will A. Parker, Sherman County, Texas.

The upper figure shows plan of corral (containing watering place) and breeding chute. The chute is made 28 inches wide for small range mares, but wider for large ones.

The lower figure shows the side elevation of the chute, which is 16 feet long and 9 feet high, boarded solid for two feet at the bottom and above that are two 2 by 6's, three 2 by 6's and one 2 by 4. Through the round holes in the 2 by 8's a 2½ inch gas pipe bar is slid to hold the mare in position. The posts are set three feet in the ground.

"SCRATCHES."

To the American Breeder:—In the spring of the year when the roads become muddy, and the barn floors, corrals, and stalls get wet and dirty, the skin of the extremities of horses is exposed to the irritation of dirt, filth and cold, a condition which is apt to result in an inflammation commonly known as "scratches."

The most important fact to call attention to is that filth is the most active of these agents and can be controlled by the person in charge of the live stock.

The coarse breeds of horses, especially those with white feet, are most subject to the disease.

The prevention of disease is not always spectacular but it is of far more importance than the cure.

In regard to the stall, keep it free from holes which collect urine and filth. Needless to say, the manure should not be allowed to accumulate, and plenty of dry bedding should be provided.

If the horse has been driven over muddy roads it is advisable to allow the limbs to dry before cleaning. If it is convenient to wash the legs with tepid water, while the mud is still fresh, and then dry them with a towel or rub-cloth, fairly good results may be obtained. But a better method consists in scraping the most of the mud off while fresh and allowing the rest to dry, then with a brush it may be removed thoroughly and without irritation.

Clipping a horse's legs is not a good practice. The long hair of the fetlock may advantageously be removed since it adds no warmth or protection to pastern or heels.

H. E. KINGMAN,
Colorado Agricultural College.

A $1,000 SADDLER STAKE AT MEXICO, MO.

To the American Breeder:—A new plan of offering stakes for competition among saddle horses has been inaugurated at Mexico, Mo., this year. The Commercial Club of that city believes that one of the best things it can do to help the city is to do all in its power to develop better farming and better live stock. Mexico is one of the greatest centers for the production of five-gaited saddle horses in the world, hence the Commercial Club has decided to offer what is known as "The Mexico Commercial Club Guaranteed $1,000 Saddle Stake."

The stake is to be shown for at the Mexico fair this fall. It is guaranteed by fifty of the leading live stock and business men who live in and about the city. The conditions of the stake are: One per cent, or $10, to nominate a horse to be shown; 2 per cent additional, or $20, to be paid before the contest, and 5 per cent, or $50, to be deducted from the money winners. The money to be divided as follows:

First prize	$500
Second prize	250
Third prize	150
Fourth prize	100

This is the first stake of its kind to be offered in Missouri for saddle horses or any other class of live stock. Its success can be watched with interest since the same general plan may well be put into operation by county fairs in this or any other state. It seems highly probable that effort and money of a commercial club directed in this way will have a prominent and noticeable effect upon the adjacent country and thereby help the city. It also seems that work in this direction is of more lasting good than many other efforts undertaken by such organizations. This new line of work for commercial clubs seems very commendable.

E. A. TROWBRIDGE,
Missouri Agricultural College.

MORE ABOUT BREEDING TERMS.

To the American Breeder:—Down in this part of the country it is the custom to insure a colt to stand and suck, which in our opinion is mighty nice for the mare owner, and is just about as liberal as the average stallioner can make terms and live.

Our patrons never object to the clause "All mares parted with before foaling time will be considered with foal in every case," for the simple reason that any mare bred and safe in foal to a good horse will sell for much more money than one which isn't, other things being equal, for aside from the fact that the colt will in a majority of cases live and be worth something, it proves that the mare is a breeder and clearly demonstrates that she will be a more profitable investment than a gelding or a mule.

When a man pays $1,500 to $3,000 for a high class stallion, few fair minded men will expect him to lose the 10 or 20 per cent of mares that usually change hands in the course of a year. However, this is a subject which can be argued from several different angles, and we will read with interest the letters out.—William Beck, Montgomery county, Kansas.

THE PROBLEM IN IDAHO.

To the American Breeder:—Find inclosed report of a meeting of stallion and jack owners. We are going to try and get every stallion and jack owner in Ada and Canyon and Washington counties to join us. We are trying to cut out the "stand and suck" proposition. I think this is a step in the right direction. I was talking to T. F. Bowler over the phone, and he said that he had read the sample copy of the American Breeder from cover to cover three times, and was going to send his subscription tomorrow.—Frank F. Taylor, Ada county, Idaho.

Here's the agreement, drawn up and signed by the stallion owners in the meeting referred to above:

"We, the undersigned stallion and jack owners of Boise Valley, agree to charge one-fourth more of the regular service fee at time of service, and the balance to be covered by a note payable in nine months from date, without interest. In case mare proves not to be in foal note to be void. In case mare proves not to get in foal note to be void. In case mare proves not to get in foal maintaining fee will apply on next season."

The man who makes money out of hogs is the man who has them to sell when the market is up.

QUESTIONS
AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, makin git safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter: write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

OPENING MARE—A mare was brought to my barn a few days ago to be bred. She showed some signs of heat, so I started to open her up. I put my hand inside, and when I found the cervix there was a covering over it, so I could not get my fingers in. I tried the second time, but failed to get it open. The cervix was loose enough, but the cover was in the way. This mare is 14 years old, and has not produced a colt in three years, but has been bred every spring. Please explain what is the cause of this and what to do for it.—Arkansas Subscriber.

REPLY—If the cervix seems loose, and is not sealed over with a mucous plug, this mare can be opened easily. This covering you speak of, probably seems to be a partition and the cervix can be entered a short distance. If that is the condition you refer to, this can usually be opened by a little pressure, but if on entering the cervix the opening seems to end abruptly against something solid, this is probably a bend in the cervix. Turn the hand upside down, so that the finger can be turned up, and you will probably find an opening. It may be on one side or the other. If the mare is not in foal (which you can tell by the mucous plug in front of the cervix), you should be able to find the opening through the cervix. You will probably find the uterus full of pus after you have opened it, especially if the partition is present.

MASTURBATING JACK—I own a fine jack, 6 years old, that has the habit of self abuse or masturbation. Is there any cure for him? Have tried alarm shield without any success. He is quick to get ready, but will not mount a mare.—Washington Subscriber.

REPLY—Put a whang leather ring on your jack's penis. Arrange a yard in the sun where he cannot see any mares, jennets or mules. Do not take any stock into that inclosure where he could smell any urine or the scent of other horses. When you breed him, take him to another pen. When you get ready to make the service take the bridle off and only use a halter. Be very kind to him. If he has an erection there should be no difficulty about making the service, but he will often fool you and not discharge any live spermatozoa.

MASTURBATING—I have a registered Percheron stallion, coming 6 years old, bought him at coming three. He is a heavy boned, rugged horse, a good feeder and drinks well. He has plenty of energy and his colts are large and well built. He has been a fairly good server and a sure breeder, has at no time been over used. He has a large yard, five or six rods, with shed and box stall in barn in bad weather. About the middle of last season he had trouble with his penis getting large at end, and being unable to enter, and when he did serve he came off too soon. Have imported and high grade mares. Other horses run around his yard, which is boarded up and down eight feet high, except about 20 feet on the west, which is fenced with high woven wire, to let in sun and air. Can it be excitement caused by the other horses, or have I been a little careless about washing his sheath, allowing him to get "foul," or can it be masturbation?—Kansas Subscriber.

REPLY—It is not common for a stallion to form the habit of masturbation in the middle of the breeding season, but the symptoms you describe indicate that your stallion is masturbating. We would suggest that you give him plenty of exercise, increasing it gradually every day. Take a piece of whang leather and measure around the penis so as to make a ring the right size for the penis when it is not expanded. Have the harness-maker sew the ends together and trim the edges so that it will be perfectly smooth. Move the ring forward and backward so as not to leave it in one place long enough to cause irritation. Do not use him as a teaser, as this only aggravates the condition. Test the semen every day so you will know what results you are getting. You can't afford to breed those high class mares to a stallion that is not discharging live spermatozoa. Keep all mares away from him, so that he cannot see or smell one. After you exercise him sufficiently, keep him in a dark stall. If his penis should become irritated bathe it in hot water as soon as you notice it. Keep the sheath clean by using bran and warm water.

A RANK SERVER—I have a stallion, that sometimes in teasing mares his penis expands so large on the end that it is hard for him to enter the mare. What is the cause of this? Lots of times he stands and plays with it in the barn, and it enlarges.—North Dakota Subscriber.

REPLY—Give you stallion a little more exercise, beginning with one mile a day, and increasing it a little each day until this condition is relieved. Do not use him for a teaser unless compelled to do so. When mares come to your barn to be teased, tie them to the hitch rack and let the stallion pass by them several times without getting close to them. By doing this, you can avoid considerable teasing. Keep everybody away from the mare, and let her stand quietly where she can see the stallion. In only a few cases you will have to take the mare to the teasing pole. After you have teased the mare, and a service is to be made, take the stallion to the barn, take off the bridle, and leave him there for a few minutes. Then have the mare in a good, accessible place, then put on the bridle, and bring the stallion out, and let him make the service before the erection is too severe. The penis fills with blood when the erection is made, to the extent that the nerve centers are temporarily paralyzed and do not perform their natural functions.

STALLION REFUSES TO SERVE—I have a thoroughbred Percheron mare, coming four this spring, that I bought from a man who claimed that she was in foal, but she is not. She comes in heat, but the horse won't serve her. He is quick to serve, and never refused anything else. Will you kindly tell me what the trouble is?—Montana Subscriber.

REPLY—See if this mare has not some peculiar odor on her, such as is found on harness occasionally. If you cannot detect any, it would be better to wait until this mare would have time to have a colt. Just because she comes in heat is no evidence that she is not with foal. If she does not deliver a foal, have a veterinarian make an examination for a mumified fetus or a diseased condition of the uterus. Stallions frequently know more than their keepers. If your stallion is a prompt server for other mares of the same color, there is a cause for him not serving this mare. Look for it.

TRAVELING A JACK—I have a 7-year-old jack, in good shape and a quick server. I want to make two stands with him. They are about eight miles apart. Would it hurt him to be traveled that far? He would go eight miles and stand four days, then go back eight miles and stand three days.—Illinois Subscriber.

REPLY—Move your jack once and see if he will make a service in a strange place. This is the only difficulty in traveling jacks as they frequently will not serve if taken away from where they have been kept. If you have tried him and know that he will make a service promptly at the other stand, there should be no objection to making two stands. It is best, however, to move a jack after sundown, more especially until he gets familiar with traveling. You had better have his feet trimmed and put on light shoes. A very good way to move jacks is to drive them to a light cart, then you can take your paraphernalia with you and not annoy the jack by having any other animals around him. Some breeders travel a stallion and jack together by working the jack and tying the stallion behind a spring wagon.

JACK SORES—I have a very fine jack that has a sore on his hind leg in front of his hock. This gets sore every spring and stays sore all summer, and usually heals up in the fall. This year it is much worse than at any other time before. The leg seems to be swelled slightly. I have tried all the remedies that I have seen in your paper, and everywhere else, that I could find, but none of them seem to cure this jack.—Missouri Subscriber.

REPLY—Poultice the sore with a hot bran mash for 10 hours. Put the poultice on with a bandage like race horse men use on their horse's legs. Pour hot water on this poultice every half hour (have the water as hot as you can hold your hand in), then wash it with castile soap and rinse it off with clean water, and dry it with a very soft, clean cloth. Take a pair of shears or a sharp knife and cut off all the hairs that interfere with the sore, being careful not to irritate the sore.

You will find advertised in this paper Jack Sorine, and this remedy is sold under a cash guarantee without any restrictions. Mr. O. P. Wilson has deposited his check with us for $500 to make the guarantee good. The owner of any good jack can afford to give $5.00 for a remedy that will cure the jack. We have seen a number of jacks that have been cured with this treatment, after nearly everything else has been tried on them. It is a paste and should be used twice a day on an average case. A serious case will require three applications, one early in the morning, one at noon and the other in the evening. This paste should be put on sparingly with a small paint brush. Be careful not to get it on the hands, as it has a scent that is very hard to remove. A little exercise each day will be good for the jack. If the bowels are not open begin feeding about a teaspoonful of Glauber's salt and increase or decrease until satisfactory results are obtained.

FEED AND SERVICE—I have a thoroughbred Percheron stallion that will be three years old the 13th of May, and weighs 1,400 pounds. For the last few days he does not eat any grain to amount to anything. Have been feeding oats and wheat chops (six parts oats and one part wheat). Do you think this a good feed, or what would you recommend and how much? Would like to breed him this season. How many mares should he have, and at what intervals would you recommend?—Pennsylvania Subscriber.

REPLY—Change the feed to oats and wheat bran equal parts by measure unless you are feeding alfalfa and clover hay. In that case feed two-thirds oats and one-third bran, by measure, and change the hay to one-third alfalfa and two-thirds timothy or prairie hay, or feed clover and timothy equal parts. Don't feed any wheat or rye to a stallion at any time, as it has no value for a stallion and is dangerous to any animal that is not sufficiently exercised. It is a bad practice. For a 3-year-old stallion a service every other day is about right. This stallion, being small for his age, might serve four or five mares a week, with no two services closer than 24 hours.

MARES WON'T COME IN HEAT—I have some mares that do not come in heat for thirty or forty days after having a colt. Can you tell me the reason of this? At what time after having a colt should a mare be bred?—New Mexico Subscriber.

REPLY—Breed them with a capsule on the ninth day, whether they are in heat or not. The ninth day is the usual time for mares to be in heat.

CAPSULE BREEDING—I have a pure bred Percheron stallion, and have more business than I can do with the natural service. I am interested in the capsule system. Is it a success, and could I hire a man during breeding season that understands capsule work, at a reasonable remuneration?—Nebraska Subscriber.

REPLY—Capsule breeding is successful for those who wish to study the instructions and follow them closely. We do not know of any man who has had practical experience in capsule breeding that you can hire. We have received thousands of letters during the last few weeks asking for experienced men. You ought to get familiar with this work and do it yourself. Educate your colts to come to your place at 4 o'clock in the afternoon. Only make one service a day, then you can employ a hand to take care of your horse the balance of the time.

WORKING STALLION—My stallion gets one-fourth of the mares in foal. He is a registered horse and is a good one, and gets good stock. He is all right in every way so far as I can see. He keeps fat all the time. Can't get him poor, so I thought I would work him on the farm this summer. Would it make his a sure foal getter? I bred him the first season to 100 mares and for two seasons following I bred him to 100 mares. This season I only aim to breed him to one mare in the morning and one at night. He is too fast. What must I do to get foals?—North Dakota Subscriber.

REPLY—In order to obtain the best results from exercise for a stallion, this preparation should begin 60 days before the season starts. If you work your stallion this season commence very moderately, by giving him one mile of exercise a day, until he is taking about eight miles of exercise daily. If he begins to lose in flesh decrease the exercise. Increase the feed with the exercise so as to keep him gaining nicely during the breeding season. The object of exercise for any breeding animal is to increase the health and strength of the animal, by strengthening the digestive tract and the benefit of the fresh air. Violent exercise will not be of any advantage. If the stallion is a draft horse he ought to be walked, if a road horse he should be driven as the average road horse is used. Make two services one day and one the next. Three services in two days is sufficient for any matured stallion, if they are regular.

STALLION GUARANTEE—I have a stallion that I bought in Iowa. He was guaranteed a 60 per cent foal getter, but only got 25 per cent the first year, and the second only 20 per cent. Can I collect damages or make him take the stallion back?—North Dakota Subscriber.

REPLY—Your own figures would indicate that your stallion was in better shape to produce foals when you got him than he was a year later. It is our opinion, from these figures, and without any more information that the keeper of the stallion needs the guarantee worse than the stallion. You cannot expect to breed two mares a day, taking all mares that come, and continue to get 60 per cent of mares in foal. If you will keep this stallion another year and begin to prepare him before the season starts, and reject some of the diseased mares you can greatly increase the per cent of foals. This stallion may be one of those having a feminine character that will not make more than one service a day and produce live spermatozoa. The thing for you to do is to get a microscope and test the semen so as to know what your horse is doing. Watch the bowels, and regulate their condition by the amount and kind of feed you use, and remember that it takes more than a guarantee to produce colts. The care taker has much to do with the per cent of foals. No one can expect to get a large per cent of foals by breeding all the mares that come to the barn. The fact that the stallion has produced 25 per cent of foals, is evidence that he could be made an average foal getter. Read your guarantee over carefully, and be guided by its contents.

STALLION CAN'T SERVE—I have a stallion nine years old that served mares all right last year. He looks all right, but he acts like a man that has lost his manhood. Tries to serve a mare but can't. For the last five months I have fed him on straw, corn

and bran. I have asked two veterinarians and they don't know. I have taken good care of him.—Indiana Subscriber.

REPLY—Without more information on the subject we could not answer intelligently, but would suggest that you get a mare that is in good heat and turn this stallion loose with her in a good enclosure, and watch the results. Do not let him wear himself out, but let him try a few times. If you will write us in full, just how he acts, we may be able to help him.

MISREPRESENTING BREEDING STOCK—Is a man privileged to advertise a stallion for service as any particular breed unless the horse is of that blood, in New York state?—N. Y. Subscriber.

REPLY—There is no law in the state of New York prohibiting the standing of a stallion of any of the different breeds or grades, that we know of. It would be difficult for you to prove that this stallion did not contain some Percheron blood. If there was a stallion inspection law in the state, then you could force him to comply with the law, providing the law is not unconstiuttional.

SERVICE FEE PROBLEM—A owns a horse. B has two mares so near alike that the average man cannot tell them apart. B breeds mare No. 1 to A's horse on July 30 and in 21 days he drives the two mares in to have the one that was bred retried. They were tied just outside the barn to the rack where they could see and hear the horse and the keeper being a close observer, saw that it was useless to tease them as they were not in season. B claims that on his way home he stopped at C's barn and breeds mare No. 2. On July 5 one mare foals a colt, just running over one day from the date she should have foaled from A's horse. A asks C if B bred a mare to his horse and C says he did, but when C examines his books he says he has not got the date down on his books, and don't know the date she was bred. Would the mare, if bred to C's horse, run 21 days under time, or is B and C trying to beat A out of a colt?—Ohio Subscriber.

REPLY—It is possible for a mare to go 21 days under or over her regular period, but you can sue on this account if you can prove that this party's mare was bred to your stallion on the date named, and collect the service fee, if the mare had a colt. It would then be up to the mare owner to prove that the mare did not settle to the service of your stallion, which he could not do. The other stallion owner can also sue and collect if he cares to. The breeder must always use his best judgment about such cases, as frequently more damage is done in the way of future business than the service fee amounts to. If you collected this service fee it would cost about as much as you would get out of it. A very good way to handle this man is to watch him the rest of his life.

THREE-YEAR-OLD JACK—Is a jack as sure a foal getter at three years of age as at any other age?—Tennessee Subscriber.

REPLY—A 3-year-old jack should be just as sure as at any other age, for a limited number of services, if the jack is in good condition and the spermatozoa tests well under the microscope.

SPOILED JACK—I have a nice, young jack, three years old last September. I let him serve about eighteen mares last season, and will show about 10 colts. He refuses to work this season. I've got four services. He is in fine condition and eats well. I am feeding his on oats and some dry wheat, and a very little corn. He is lousy. I am working on him for lice. He also coughs some. If he has had any chance to get distemper, I don't know of it. I let him serve three jennets at the close of the season last year. Do you think this is the trouble? He served just a few times during the winter.—Tennessee Subscriber.

REPLY—You made a great mistake in allowing this young jack to serve jennets, as he is liable to always bother you a little. Young jacks should never see or smell jennets or mare mules for the best success, until the breeding season is over and after they have made three successful stands and have been thoroughly broken to serve mares. This jack has become infatuated with jennets. Take

The Prevention of Navel Ill

A Widespread and Serious Source of Loss to Colt Raisers Which Can Successfully be Controlled Only by Prevention. Cause and Symptoms and the Best Means of Prevention.

Navel infection in the new born is far more frequent than is generally recognized by stockmen. The losses sustained yearly from the several diseases that may be contracted through the lacerated navel cord is something enormous. In fact, in some localities the disease this season appears to be unusually severe and we predict bitter disappointment and extensive. financial loss for those who have not given this disease close study and taken advantage of those effective measures that will prevent the disorder.

The navel cord may be briefly said to be simply an avenue through which certain blood vessels pass from the foetus to the envelopes attached to the wall of the uterus, and it is through these vessels that the blood of the foetus passes in its particular round of circulation. In addition to these blood vessels there is a tube connecting with the bladder that permits of the escape of the urin of the foetus during its growth and development. During or at birth the cord is torn asunder, creating a wound with these open vessels exposed. Inasmuch as the foal lies down a great part of the time after birth the position it assumes gives a most excellent opportunity for infection to occur and of a very grave character for the reason that the organisms may gain immediate entrance to these several vessels. In the event the germs find their way into the tubes communicating with the bladder they would set up an inflammation of those parts and very likely would result in the foal persistently urinating through the navel. Nearly all cases that urinate in this way are infected and it is the infection that causes death of the colt and not the mere fact that the urine escapes at this point.

Probably the inrection is more serious when it follows the course of the blood vessels mentioned, for the reason that unless these vessels become plugged with an impenetrable blood clot the infection will shortly reach the blood stream where it will have the opportunity of being promptly distributed to every part of the body through the medium of the blood.

The symptoms of such infection are a disinclination of the foal to nurse, it is stupid and dull, with stiffness of gait. The amount of fever present is governed by the severity of the infection. Frequently the navel is noticed to be swollen, glistening and exudes a watery substance or pus.

One can not judge the severity of the affection by the appearance of the navel for the reason the germs may penetrate deeply, in which instance more harm is done than where there is great local disturbance noticeable. It will be seen that when the germs have gained access to the blood stream that they have the opportunity to float to any part of the body. Seemingly they appear to affect the tissues in the neighborhood of the joints most, but may form abscesses in any part of the body.

Localizing about the joints the germs cause swelling of the parts resulting in sudden and great lameness. There is a tendency for the disease to shift from one joint to another, leading some to associate it with rheumatism. Occasionally the swelling at the joints will become so great that the tissues will give way and permit of a discharge of pus mixed with the joint oil. Such cases nearly always die. Navel disease is a very fatal malady, partly because it attacks young animals having little power of resistance and partly for the reason that the disease, almost before being observed, has reached those vital parts where it is beyond the reach of medicine.

Veterinarians as a rule do not welcome the treatment of these cases, for the reason that their very nature makes the majority of them hopeless from the start. Besides should skilled treatment save the life of a valuable colt there is always danger of its being permanently crippled for the reason that the surfaces of the joints become diseased in a manner so that they never fully recover.

There is only one way to successfully handle navel infection and that consists in its prevention. This paper has from time to time emphasized the importance of having mares foal in box stalls that have been made scrupulously clean and kept bedded with nice, bright straw. The infection is usually contracted within a few hours after birth while the cord is moist and every one who has observed the behavior of these cases has noted that the danger lessens as the cord becomes dry.

In undertaking to prescribe agents for the prevention of this trouble we have met with no end of complaints from our patrons.

First there is the uncertainty of getting the proper drugs from the druggist. Only recently we were in a locality where navel ill was very prevalent and undertook to have a prescription filled for a powder suitable for this preventive treatment. We were informed by the druggist's clerk that they did not have all the ingredients in stock. The expense of the prescription to the owner would have been, according to the druggist's estimate, $1.20. Even at this expense the powder would have been delivered in an inconvenient and wasteful paper package, and possibly not thoroughly compounded. The very nature of preventive treatment demands that the remedy be always on hand and in shape for convenient and immediate use, and so perfectly prepared as to be effective.

In navel ill, as in most ailments where prevention is the only successful treatment, the time for prevention passes quickly and any one of the difficulties we have encountered in getting a remedy made up at local druggists is sufficient to delay or interfere with treatment until too late.

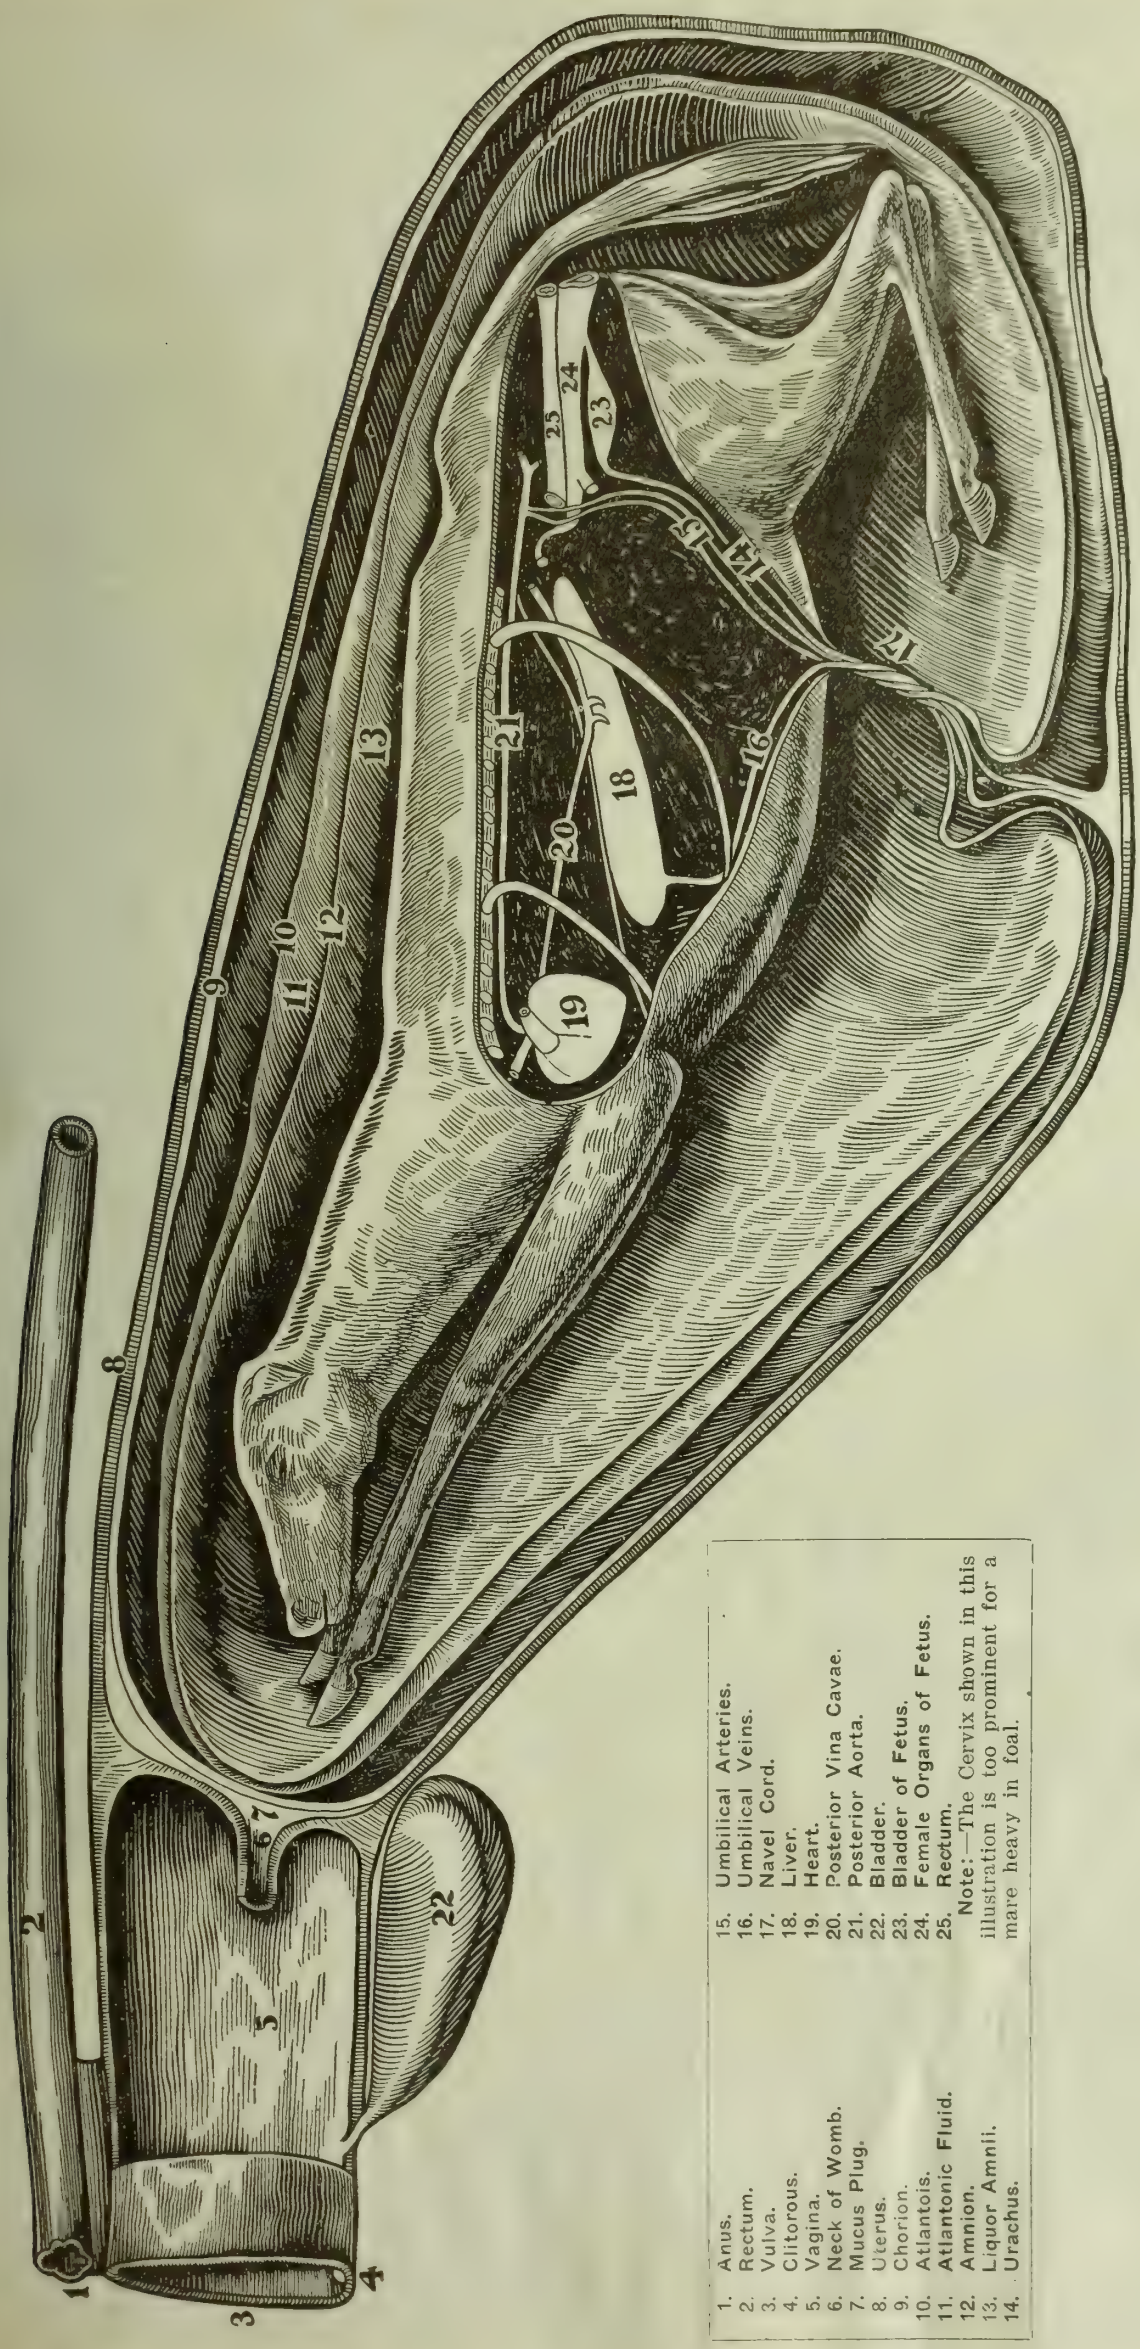
Seeking the way out of this difficulty in consultation with the best authorities, we have received a proposition from a manufacturing chemist to furnish the powder at wholesale rates, carefully compounded according to our prescription, and put up in serviceable metal containers, perforated like a pepper box for dusting it on. The price made, on condition that we guarantee the sale of a certain number of boxes (which guarantee we have given, knowing the widespread need of the remedy) to allow for the expense of handling this work and still deliver by mail, postpaid, to any address in the United States, one of these boxes at 50 cents, or less than half what the local druggist would have charged us for filling the prescription. The box will contain powder enough for the treatment of ten colts (or calves—the treatment being equally effective for either) and directions for its immediate convenient use will accompany each box. With the powder put up in this way it should be a very simple matter to carefully strip the fluid from the cord with clean hands and thoroughly dust the cord with the power. This treatment should not only destroy the germs but will dry up the cord, which is equally important. Here is a matter in which stallion owners can make a profitable campaign of education with their mare owners, and by pointing out to them the necessity of preventing the disease, rather than wasting valuable time trying to cure it they will not only render an important service to the owners of the mares but will just as certainly make their own business better.

In giving this remedy to our readers (at less than it has cost us—considering the cost of our investigations) we must urge the one point that is vital to the success of all preventive treatment, namely, that it be kept on hands at all times and that it be used promptly and thoroughly according to directions.

Orders for the remedy (we will call it simply Navel Powder) should be sent direct to the American Breeder, accompanied by 50 cents in postoffice order, stamps or any convenient form, for each box of powder desired. The powder will be sent only to subscribers to the American Breeder.

TESTING THE SEMEN.

An Iowa breeder writes us that he bred 150 mares last year by the natural service, and most of them had colts by their sides and were regular breeders. He states that he will only get about 30 colts out of these mares. He says that he knows the stallion discharged at every service, and he can't understand why more of these mares did not get in foal.



The difficulty is that the stallion did not discharge live spermatozoa at every service. The fact that a stallion discharges at every service is not evidence that the semen contains live spermatozoa. Semen is composed of several fluids coming from the Cowper's glands, prostate gland, ejaculatory duct and the vas deferens. The discharge may be composed of fluids without any spermatozoa (which comes only from the vas deferens) and may seem natural in every way, and yet have no value as a fertilizing power.

The only way to tell whether a stallion is discharging live spermatozoa is through the use of the microscope. There is no instrument that has more value as an advertising medium than a good microscope for a stallion or jack. Only a very few men have had the opportunity of looking through a microscope and seeing the spermatozoa. The average man is of the opinion that it takes the entire discharge of a stallion or jack to make a colt, while in fact, only one spermatozoon can be used in fertilizing one colt. There are millions of spermatozoa in the average discharge of a stallion or jack, and this shows the great waste and the necessity of using artificial means.

Anyone ought to be able to adjust a microscope so that the semen can be examined. For the average 500 diameter microscope use a dusty glass in focusing. There will be particles of dust on this glass that will help the operator to find the adjustment. For the microscope used in the Graham Scientific Breeding School the lens should have two thicknesses of a sheet of newspaper between the lens and the glass, then turn it up and down, just as slowly as possible until some object comes in view. No matter how slowly one turns he is liable to only get a glimpse of something, but when that object is noticed the operator should stop immediately and turn back just as slowly as possible until it is noticed again. After the focus is found the operator should learn just how far the lens was from the glass, so that it will be easy to locate an object the next time. This should be repeated several times for practice.

The microscope should also be set in such a position that the mirror would reflect the light from the window, up through the microscope so that when the operator looks into it, it will look nearly white to him. The microscope should be placed in the shade, and after it is adjusted properly a few drops of semen should be put

on a clean glass, then allow all the semen to run off of the glass, so as to make it real thin on the glass, then turn the microscope up just as slowly as possible, which will give the adjustment to provide for the thickness of the semen on the glass.

All those present should be given an opportunity to look at the spermatozoa, which looks like hundreds of "wiggle tails." It will not be long until there will be a great many people coming to the barn to look through that microscope.

BREEDING CRIPPLED MARES.

All crippled and "heavy" mares should be bred in the fall of the year, soon after the hot weather has passed. This will bring the foaling time of the crippled mare in the fall of the year, and not cause her to carry a heavy fetus through the winter and make it difficult for her to get around. It is usually all a crippled animal can do to skirmish for feed, without having an extra heavy body to interfere with her locomotion. Many horses are loose together during the fall and winter, and if the crippled mare is not active she is very liable to be kicked or hurt to the extent that abortion would occur. On the other hand, if a mare delivers a colt in the fall of the year, the owner will take her up and take good care of her because it will be profitable for him to do it.

Occasionally a "heavy" mare will fertilize during the spring season and carry the fetus to maturity, but many of them are fatigued during the hot weather to the extent that an abortion is the result. After one of these mares has lost a colt or two it is very difficult to get them to carry a colt to maturity, but if they are bred in the fall, and show to be in foal the following spring, the owner usually feels that it will be better to turn the mare out to pasture where, if she is not interfered with, she will probably carry the colt to maturity.

There are a lot of crippled and "heavy" mares bred every spring from two to three times that get absolutely no results whatever. These same mares can be put off and bred in the fall with good results. Some of them will need treatment. They should be treated with the iodine treatment and turned out to grass, and bred in the fall.

THE SEMEN EXTRACTOR.

To the American Breeder:—We used a Carlson semen extractor last season and like it very much. In fact we don't think anyone could stand a good horse for public use without one. While it is a little early yet to tell just the per cent we will get, but have kept track of all mares bred by capsule and by natural service. This year will not be a fair test of either method owing to weather conditions causing heavy abortion.

Any person knowing enough to own a good stallion and be on a farm, can, by taking the American Breeder and reading it carefully, use this extractor and breed by capsule, as it tells you just what you should know and when. We bred a good many wild mares by capsule as we thought it too risky to breed them by natural service, breeding a gentle mare, extracting the semen from her and breeding the wild mares in a chute just as they came, whether in heat or out. Hoping to gain much from your paper and wishing you a prosperous year.—Hester Bros., Sherman county, Texas.

If good roads from the producer to the consumer were general, the benefits to both would be considerable.—From the 1911 report of the United States Secretary of Agriculture.

Alaska will some day provide farmers in lower latitudes with grain seeds superior to what they can grow at home.—From the 1911 report of the United States Secretary of Agriculture.

THE AMERICAN BREEDER

With which is combined
THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE
Editors.

Published semi-monthly (on the 5th and 20th of each month) by the
GRAHAM PUBLISHING COMPANY,
INCORPORATED.
225 WEST TWELFTH STREET.
Kansas City, Mo.
BELL TELEPHONE, 4297 GRAND.

All communications for this paper should be addressed to the American Breeder, or the Graham Publishing Company, and not to individuals.

Advertising space for a single issue, $2.80 for an inch or less. For larger space or longer time, rates furnished on application.

Subscription Rates.

To all points in the United States and Mexico, per annum, 50c; 3 years, $1, payable in advance.

To all points in Canada, per annum, in advance, 75c.

To all foreign points (in the International Postal Union), per annum, in advance (6 francs, 5 shillings), or $1.15.

When sending subscriptions, please state whether they are renewals or new ones. Always renew under the same name and initials as previously used, and at least two weeks before your present subscription expires, so that you will not miss any number. When changing your postoffice address, state the old address as well as the new one.

Watch the wrappers on your paper. The month before your subscription expires they are stamped "your subscription expires with next issue," and on the following edition is stamped "your subscription expires with this issue." When the time for which the AMERICAN BREEDER is ordered has expired, it is always discontinued.

If you miss your paper please notify us at once and all lost copies will be replaced.

Entered as second class matter, November 23, 1911, at the postoffice at Kansas City, Mo., under the act of March 3, 1879.

All persons are warned not to reprint any part of this paper during 1912, without giving full credit for the same to the American Breeder, Kansas City, Mo.

STALLION CASH GUARANTEE.

An Illinois reader writes us that he purchased a stallion that was guaranteed to be a 60 per cent foal getter, and that the guarantee stipulated that in case the stallion did not get 60 per cent of the mares in foal he could return the stallion and get his money back. The stallion only got 25 per cent of the mares bred in foal, and the stallion dealer has refused to return his money and take the stallion back, and he asks us what to do.

From 25 to 40 per cent is all the average stallion gets the first year. There are several factors that keep the per cent low for new stallions. When a new stallion comes into a community he has an opportunity to breed many mares that have refused to settle elsewhere. Many of these mares are diseased, which adds to the difficulty. The stallion owner usually changes the feed and conditions under which the horse has been kept, and change of water or possible climatic conditions also have their effect. But the fact that a new stallion has arrived has an attraction for a lot of mares that could not be settled by the natural service, and herein lies the principal difficulty.

If this stallion is properly handled next year and has not made too many services, he should prove to be better than the average foal getter. The past year has been a difficult time for raising colts, and there will be lots of disappointments this spring, to the stallion and jack owners and the mare owners as well. This stallion owner ought to be thankful that the stallion has turned out as well as he has, for this stallion dealer has been refused advertising space in the American Breeder because he does not make his guarantees good, and for another good cause. I don't think he ever intended to refund the cash when he made the cash guarantee, but there are a lot of buyers that are looking for the impossible and want something for nothing, and these are frequently the ones that get skinned. This breeder probably knew that this stallion dealer had a shady reputation, and if he did not know it, he could have found out by asking most anyone interested in stallions. Just as long as the buying public sist on guarantees specifying 60 to 80 per cent of foals, just that long will they be disappointed.

The cash guarantee never looked good to us. We don't believe it right between men. If the stallion buyer investigates the reputation of the stallion dealers he will find plenty of them that will guarantee the stallion to be satisfactory or return him and get another horse of equal value. Occasionally there is someone who takes advantage of this, but those who expect to remain in the business cannot afford to do that. We have investigated a number of these cases, and where we thought the stallion was not going to be satisfactory, we have asked our advertisers to make a satisfactory adjustment, which has been met in every case. Both the stallion buyer and the stallion dealer must be reasonable in these cases. There is not one stallion in a thousand but what will make an average foal getter if properly handled, but there are many men in the stallion business who will not be successful in getting the average per cent of foals.

DIFFICULT BREEDING SEASON.

There never was a time in history when the mares as a general rule were in a worse condition at this time of the year, with corn selling at 80 cents a bushel, hay at $15 a ton and a very late cropping season. The mares are very thin, as a rule, and many of them have aborted. Those who have not adopted the system of treating barren mares should arrange for it immediately. This will give an opportunity to put the shy breeding mares off until their general condition can be improved in the way of shedding, and getting better accustomed to work even though they are thin.

We know it is an unusual measure to advocate treating every mare that does not have a colt by her side, or that is not in foal, but we believe it will be profitable. An arrangement can be made whereby these mares can be treated in a very short time. Only breed the mares that have colts by their sides. There will be lots of difficulty during the breeding season—more than in all history, as a rule (although some sections of the country have not fared so badly), and if treatment of barren mares is not put into effect there will be a lot of the good stallions ruined. The mares are not going to settle easily this spring, and many that do settle will lose their foals if they are bred too early. If a lot of mares return every three weeks, it will not take a great number of mares to tax a stallion or jack to his limit. The breeders cannot afford to injure valuable stallions and jacks, and if they do not resort to the treatment of barren mares, many of them will be forced to use the capsule system in order to keep up with the number of services required. The vitality of most mares is very low, and we are of the opinion that many of them will come in heat at regular periods without discharging mature ova. Every stallion or jack owner should talk to his mare owners, and explain the existing conditions, as the stallion or jack will be censured if the mares do not settle readily. Explain to them that the conditions are very uncommon.

There never was a time when the farmers were busier than at the present time. It would be an excellent time to adopt the capsule system in most communities if a stallion or jack is behind with his dates and owners of good mares cannot get a service, they are going to patronize scrub horses liberally if they are convenient. There will be lots of mares bred to scrub stallions this year owing to a lack of time for satisfactory dates. Every breeder should wise up and study the capsule method of breeding. It is an absolute success for those who will follow it properly and with the right intention. We have published the names and addresses of hundreds of responsible breeders who are using it, and no intelligent man can doubt the possibility of it being a success in his case. If breeders would take the time to investigate this proposition, they would see that they are standing in their own light, in not adopting the capsule system and following it as we have instructed. The average breeder can use the capsule method of breeding, if he will only try and follow the instructions.

BREEDERS VOTING BY PROXY.

At the present time there is much discussion as to the manner of voting in the American Saddle Horse Registry Association. The idea is advanced that no member should be allowed to vote over three proxies, thus placing a limit on the number of proxies voted by any member present. It is generally understood that a good number of breeders reside in Missouri and only a few of them will be present at the next election.

There has been some factional fighting between Missouri and Kentucky as to the election of officers, and other things have entered into the strife. In 1909 a very severe row was threshed out and we hope that another fight of this kind will never be necessary. The Missouri breeders came very near establishing a separate record. The fight at that time was thought to have been over certain blood lines in the association, but the affairs in that association at the present time are not as smooth as the breeders would like to have. A registry association is—or at least should be—run for the producers of that particular breed of live stock, and the officers ought to be elected by these people, and their duty should be to deliver the best possible service, but we are very sorry to say that some of the officers, instead of trying to deliver the best service, get busy in a political way.

We should like to see every association remove every officer that sends out proxies and has his friends work for his re-election. Too much politics has been going on. Every breeder ought to take a hand in these elections. It is his duty as a man and a breeder. When a set of officers use their influence in electing other officers that they can handle, thereby forming an alliance, so that the breeders never can have a voice, it should be stopped, and there is no better time to do it than at the present time. If an office is an honor it should not be monopolized by one or a few men, and if it is a duty it should be divided up also. The breeders themselves are generally back of these upheavals in their associations. Nearly all of them have come about as a result of the breeders being dissatisfied with certain officers, and in nearly every case the breeders have been right. When an officer does not perform his duty correctly he should have brains enough to vacate before he injures the association. There are plenty of good men to fill these offices, and occasionally a man can be found that would improve conditions wonderfully.

Every breeder should keep his ear to the ground, and the first time an officer sends out one of those tricky, proxy cards for him to sign, it is then time to get busy and remove such an officer. When an alliance is formed by the office holders, the breeders should know their duty and that is to vote with the breeders. If an officer has performed his duty as an officer should perform it, it will not be necessary for him to send out any proxies and campaign for votes and use the machine for re-election. He is not a good man to elect. Officers while in office have all the opportunities for re-election without using any machine methods.

Every breeder that owns one or more shares should have a vote either personally or by proxy. It is limiting this right to try to specify the number of proxies any one individual shall vote. If proxies are used there can be no limit according to law, as it would be unconstitutional. A proxy can be made a power of attorney just the same as any other power of attorney, and gives the proxy holder the same right to vote for him that he could give any other individual through the agency of a power of attorney.

We would say in conclusion that if the officers as a rule would not try to hold over against the wishes of the majority of the breeders, less strife would be had in numerous registry associations.

ARTIFICIAL IMPREGNATION.

At the discharge of a stallion or jack there should be millions of spermatozoa. The discharge from a stallion is much greater than that of a jack. An average stallion should discharge at least eight ounces of fluid once a day with much regualrity. The average jack should discharge about three ounces. In one drop of fertile semen the spermatozoa should be so numerous that it would be impossible to count them. It requires only one spermatozoon to produce a colt if it meets a matured ovum in a normal, healthy, producing mare. The balance of the service from a stallion or jack is wasted. This shows the great possibility of making a stallion or jack one of the greatest money makers that can be purchased for those who are willing to learn how.

In the fertilization of the ova it is necessary that the semen be discharged or placed in the uterus to insure a large per cent of foals. The writer has deposited semen in the vagina of mares that produced foals, but the per cent of these mares that would produce foals was very small. The semen must eventually work its way into the uterus before conception can take place. This is one reason that such a large per cent of foals can be produced with the capsule system, as the capsule system of breeding is a complete service. It matters not how the semen is conveyed into the uterus so long as it is kept at the right temperature without coming in contact with the direct rays of the sun, or does not come in contact with bacteria, which are destructive to spermatozoa. This is one of the reasons that the semen should never be taken from a diseased mare.

When a mare is to be used to make the natural service on an examination should be made of her tail. If the vulva are stuck together it is usually evidence that there is a diseased condition in the uterus, and this mare should not be used to make the natural service on. One would naturally think that a remedy in this case would be to use a breeder's bag. The writer has experimented with all sorts of breeder's bags, and occasionally a jack will be found that will work for several years with a breeder's bag without going wrong. These are usually jacks that were broke to the bag when they made their first service, but even with these jacks they do not discharge more than two-thirds as much semen, in a bag as they will with the nautral service, and quite frequently no spermatozoa will be contained in the semen. There have been more good stallions and jacks ruined through the use of breeder's bags than from all other causes combined. Quite frequently a valuable animal is ruined for a considerable length of time from only using it once.

The only successful method of artificial impregnation that can be counted as having any value is the capsule system as introduced by G. L. Carlson. By using this method there is no

chance of injuring the stallion, jack or mare, and a large number of mares can be bred at one service without any difficulty, by any average stallion or jack owner, and a greater per cent of foals can be obtained in this way than from the natural service if properly handled. This is a great advantage to mare owners as well as the stallion and jack owners.

A certain hour can be set that all the mare owners will know that they can get their mares bred at that particular time without having to telephone or send work asking for a particular date. A little talk to the mare owners will soon convince them that it is a saving to them, as they can arrange their work so as to be at the breeder's place at the hour set for breeding, and not be compelled to wait or lose any extra time.

JACK SORE REMEDY WITH A CASH GUARANTEE.

One of the greatest difficulties with jacks is the jack sore problem. At last there is a remedy that will cure nearly all of them. Mr. O. P. Wilson, one of the big jack breeders in Missouri, has experimented for years on this remedy, and has it perfected to the extent that he never fails to effect a cure on his own jacks. He has such great faith in this remedy that he is going to guarantee it to cure any sore on the legs of either stallion or jack, and if it does not cure any sore satisfactorily to the purchaser, Mr. Wilson agrees to refund the full purchase price without any questions, on return of the box. Mr. Wilson has deposited a check for $500 with the American Breeder to guarantee the fulfillment of his guarantee to our readers. This is a very liberal offer and we predict a great sale for this new jack remedy. We have known Mr. Wilson for several years and know that he has cured numerous cases of difficult jack sores. If any of our readers has a jack with a sore, we would recommend giving this treatment a trial, as we believe it will cure most of the difficult sores.

To the American Breeder:—Inclosed please find $1 to renew my subscription for a period of three years to the American Breeder. As some of the readers are sending in gestation dates I will tell you of two mares which I own; one mare at the age of 12 years went 11 months, bred to a horse. One mare seven years old went 12 months and 15 days, or 380 days, bred to a jack. Only one service to the jack and it was her first colt.—Will A. Parker, Sherman county, Texas.

Recognized Record Associations III

The American Hackney Horse Society

In order for a certificate of registration in the American Hackney Horse Society to be genuine it is necessary that it bear the signature of the present secretary, Gurney C. Gue, or of Dr. W. Seward or A. H. Godfrey, the only past secretaries. Any certificate not bearing one of these signatures should be forwarded at once to the present secretary at 308 West Ninety-seventh street, New York City, for investigation.

The rules, fees and so forth for recording in the American Hackney Stud Book are as follows:

Conditions and Fees.

1. A stallion shall be recorded only in the full-registry class, and must be by a full-registered sire and out of a full-registered dam.

2. A mare shall be recorded in the full-registry class when she is by a full-registered sire and is out of
   (a) A full-registered dam, or
   (b) A half-registered dam, or
   (c) An inspected dam of recognized harness or saddle blood, recorded as foundation stock.

3. A mare shall be recorded in the half-registry class when she is by a full-registered sire and is out of
   (a) An inspected dam, not of recognized harness or saddle blood, recorded as foundation stock, or
   (b) An uninspected dam; provided the mare to be half-registered is herself inspected.

4. A mare shall be recorded as foundation stock when she has been inspected by an authorized representative of the Society.

Inspection—A mare shall be deemed to be inspected:
   (a) When she has won a prize for heavy-harness horses or walk-trot saddle horses at a horse show recognized by this Society, or
   (b) When she has been approved by an officer of this Society as of hackney conformation and action and free from transmissible unsoundness; such approval to be in writing, signed by the officer and filed with the Secretary.

Recognized Harness or Saddle Blood—A mare shall be deemed to be of recognized harness or saddle blood when her sire and the sire of her dam are registered in any of the stud books designated by the U. S. Government as books of record for harness or saddle horses.

Half-registered Mares—Numbers will be given to half-registered mares, but their numbers will be in brackets, thus [1127].

Imported Horses—English export certificates must accompany all applications for the registration of imported stallions or mares foaled in England, but no entry forms are necessary.

Transfers—All changes of ownership must be recorded in the Stud Book and Registry Certificates will be reissued in the names of the new owners upon surrender of old Certificates, properly indorsed.

Names—In naming horses the adoption of a distinctive prefix is strongly advised. Members of the Society can reserve, subject to the consent of the Board of Directors, the exclusive right to use a distinctive word or words as a prefix.

No stallion or mare foaled in the United States in or after 1909 will be registered with a name which has already appeared in the stud book.

No change in the name of a registered Hackney will be recognized by the Society until such change has been duly recorded in the Stud Book, and no horse shall be eligible to compete for any prize offered by the Society under any other than its registered name.

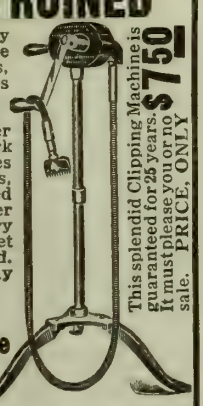
SAMPLE FREE

BROWN FENCE

15 to 35 cts. Per Rod Delivered



You can examine Brown Fence and know just what it is before ordering or paying one cent. We mail you a sample showing size and quality of wire. When you get the sample, test it with a cold chisel and see how hard, tough and springy it is. File off the galvanizing and see how thick THAT is. All wires—both strand and stay wires—are No. 9 gauge, and made of the best grade of steel. Weighs ⅜ to ½ more to the rod than most fences, and will last double the time. A more rigid, firm, stanch, stock-resisting, time defying fence was never stapled to posts. Price 15c to 85c per rod, and we pay the freight on 40 rods or more. Write for catalogue showing 133 styles of fences. We also sell direct to farmers at lowest wholesale prices—Coiled Spring, Barb and soft Galvanized Wire, Gates and Poultry Netting. Save money by ordering direct from us. Address

MANY A GOOD FARM HORSE IS RUINED

By standing in a wet, sticky coat of hair. Experience proves that the coughs, colds and other troubles that affect horses in the spring, can be avoided by clipping off the winter coat before the spring work begins. Clipping improves the appearance of horses, they bring more if offered for sale, they do better work too, because they dry out quick, rest well and get more good from their feed. The easiest, quickest way to clip is with a

STEWART Ball Bearing Machine

This splendid Clipping Machine is guaranteed for 25 years. It must please you or no sale. PRICE, ONLY $7.50

It clips horses, mules and cows without any change whatever.

About the udders and flanks of all cows should be clipped every three or four weeks so the parts can be kept clean when milking.

Complete $7.50

Get one from your dealer or send $2 and we will ship C.O.D. for balance.

Supplies Scarce; Prices Good

With Southern Markets Closed By Floods, Horse Supply Just About Meets Demand, With Steady Prices For All Good Stuff. Hogs and Cattle About $2 Higher Than a Year Ago.

This is seeding time on the farm, and horse markets have reflected the rush season by decreasing supplies. In the past ten days receipts have fallen off nearly one-third, and country buyers report that it is hard to pick up a load of either horses or mules. The scarcity of feed last winter made countrymen sell off their surplus animals, and the average horse power on farms is none too large to carry on the work. Some have had to buy horses to get the ordinary farm work under way, and by the time harvest and other work begins to claim the help of more horses there will be a much larger demand. At present the South is buying few horses and mules, but that is owing to heavy rains, and flood conditions along the lower Mississippi. Memphis, one of the principal Southern horse and mule markets, has been practically closed for more than two weeks. When Southern weather adjusts itself, and the flood conditions subside, dealers here say the movement southward will be large. At present the light weight horses that usually go to the Southern states are being cared for as light expressers and transfer fillers. Quite a considerable demand has drifted in for cavalry horses. Several companies belonging to state organizations are recruiting horses, and are trying to fill orders through local dealers. The bulk of the trade though is in heavy drafters, chunks and all purpose work horses. Men who buy want animals with weight that can stand to the work, and the constant cry to order buyers at markets, is, "get weight." In this respect they may sometimes overlook an animal with lesser weight that, in special cases, could do the work at smaller expense, but this idea for weight is constantly growing, and breeders to meet it must turn more and more to the heavy drafter classes. Heavy mules now are as high as they have ever been, and probably will continue so for some time to come. Compared with two weeks ago prices for the plainer horses are weak and for the better grades fully steady.

Prevailing prices for serviceably sound horses and mules, 4 to 7 years old, are as follows:

Drafters, 1,700-pound up	$175@300
Drafters(fair to good	150@170
Chunks, good	130@165
Chunks, fair	95@130
Southerners, good to choice	130@145
Southerners	70@125
Driving horses	65 up
Mules—	
13½ to 14½ hands	$ 95@125
14½ to 15½ hands	120@165
15½ to 16 hands	160@210
16½ or better	190@275

Record Prices For Cattle.

In the past two weeks prices for cattle continued upward and new high levels were recorded, not only for this season of the year, but also, quality considered, for any previous time, except probably during war times. The advance carried values to such high levels, that slackening demand began to warn buyers of the dangerous high levels and in the past two days the market has shown an easier feeling. Scarcity has been the moving factor in the advance. In Kansas City thus far this year receipts of cattle are more than 100,000 short of the same period last year, and Omaha, St. Louis and all southwest markets show decreases. Chicago manages to keep even with the board, but her shortage will show later in the year when supplies are maintained from the Northwest. The past winter was severe and came after a summer of short grass, which had caused a great reduction in herds. Prices have been so high, that corn belt supplies have been depleted, and the entire section that supplies Chicago has fewer cattle than at any previous time in recent years. The Kansas City movement is now at low stage. From now on until grassers begin to come it will be a hand to mouth business with killers, and there may be times when the market will become very dull, though supplies are barely equal to demand. As prices have moved upward it has been a noticeable feature that orders have been reduced slowly, and some of the small killers have fallen out of the trading entirely. Though cattle may become short of actual requirements, high prices will tend to check demand. Feeders are moving their cattle as rapidly as they take on a killing per cent. Eighty cent corn (and worse) is the great ghost of the feed lot now, and with hay $30 a ton or higher and grass not far enough advanced for a substitute, the easiest way for the feeder is to cash in.

How Cattle Are Selling.

"Mark anything that will dress 59 per cent or better at $7.50 up," was the instruction of a head buyer to his assistants early this week when demand was red hot. On that day the bulk of the steers sold at $7.25 to $8.25. Some 1,350 to 1,500-pound steers made $8.40 to $8.55, and steers fed cotton seed meal, hulls, alfalfa hay and some corn brought $8.50. Colorado hay fed sold up to $7.90, and the top price on the quarantine side was 7.85. Large bunches of meal fed steers have sold at $7 to $7.50. Corn fat yearlings have sold up to 8.25. Packers are buying what supplies they can direct from the feeders and some large bunches (including one shipment of 26 cars from Ft. Worth), are moving direct to slaughter houses. There is quite a string of Nebraska steers coming, and they for the most part are taking the high honors in the price lists. Fort Worth has received some early grassers, but none has appeared at river markets as yet. Thin cattle are beginning to move to Kansas pastures. Compared with two weeks ago, prices now are 25 to 40 cents higher and compared with a year ago $2 up. In the fall of 1910 cattle made higher levels than at present, but the high quotations prevailed for only a few prime kinds. Now primeness in the offerings is a rarity.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$8.40@8.75
Good to choice steers	7.85@8.35
Fair to good steers	7.00@7.80
Common to fair steers	5.75@6.95
Meal fed, choice	7.25@8.50
Meal fed, common to fair	5.75@7.20

Choice Butcher Cattle Still High.

Good to choice butcher cattle have made new high levels also. The plainer kinds followed for a while but in the past few days they have been slowly falling back. Some spayed Western heifers brought $7.60 and the bulk of the steers and heifers mixed sold at $6.75 to $7.65. "Canner" cows are selling as low as $3, but few cutters get below $3.50, and fair cows are quoted from $5.50 up. The veal market has been well supplied and prices have declined 50 cents. Bulls are the highest of the season.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice	$6.50@7.25
Fair to good	5.50@6.40
Common to good	4.50@5.40
Canners	3.00@4.50
Heifers—	
Choice	7.25@7.85
Good to choice	6.50@7.25
Plain to fair	5.50@6.45
Common	4.75@5.45
Veal calves	4.00@7.75
Bulls	4.50@6.50

Scarcity Restricts Thin Cattle Trade.

Receipts of all thin cattle have been very small for this season of the year, and instead of the market showing a sagging tendency, as is usually the case when grass begins to appear, there has been an advance to the highest level of the year. Several bunches of half fat steers have gone back to feed lots at $7.25 to $7.40, and stockers have sold as high as $6.85. It is hard to say whether conditions justify such prices or not, but it was a case of either paying that or see the cattle go to killers. Most of the straight stockers and feeders are selling at $6 to $6.85. There is an urgent demand for stock cows. Milch cows sold as high as $90 a head, and stock calves up to $6.75 a hundred pounds.

The following quotations are for stock and feeding cattle:

Selected feeders	$6.85@7.40
Good to choice feeders	6.50@6.80
Plain to fair feeders	5.85@6.45
Selected stockers	6.60@6.85
Good to choice stockers	6.15@6.55
Plain to fair stockers	5.50@6.10
Stock calves	5.00@6.75
Stock cows	3.85@5.00
Stock heifers	4.25@5.50
Milch cows	40.00@90.00

New High Levels For Hogs.

Thursday, hogs in Kansas City sold up to $8.05, the highest level since 1910, and exactly $2 a hundred above the same date a year ago. Compared with two weeks ago prices now are only about 5 cents higher. The market has been hovering around 8 cents for some time and will continue so until packers are enforced to raise prices. Decreasing supplies have been the cause of the advance. Omaha, St. Joseph and Chicago all show increases compared with a year ago. Kansas City started March with a 160,000 increase, and yesterday official figures showed them about 16,000 short, or a loss of 176,000 hogs in a little more than six weeks. St. Louis is rapidly absorbing the surplus that showed the first two months of the year. Reports from the country indicate a severe loss among March farrowed pigs. Packers have a large amount of product in store, and at present are only trying to supply fresh pork requirements. They are selling their product, laid in on the basis of $6 on the basis of hogs at $8.

The following quotations are for hogs:

Choice, 250@300 lbs	$7.95@8.05
Choice, 200@245 lbs	7.85@8.02½
Medium weight	7.65@7.95
Light weight	6.65@7.60
Common to fair	5.60@6.65
Stags	5.25@7.80
Boars	4.50@6.85
Bulk of sales	7.65@8.00

The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week
Mon., Apr. 15	$7.50@7.95	$7.50@8.00
Tuesday	7.60@8.00	7.40@7.90
Wednesday	7.55@8.00	7.45@7.80
Thursday	7.60@8.05	7.35@7.75
Friday, April 12	7.40@7.80	7.50@8.00
Saturday	7.45@7.85	7.50@8.00

Break and Recovery in Sheep.

In the past two weeks new high levels for sheep were recorded at the outset, then the market broke 25 to 40 cents, and in the past few days started up again, making almost a full recovery. Sheep in fleece are beginning to get scarce, and killers are anxious for them. Some grass fat grades are moving from Texas, and according to buyers they are fairly good in quality. The Arkansas valley in Colorado is about the only section that has any wooled sheep to come. Good to choice wooled lambs are quoted at $7.75 to $8.10; yearlings $6 to $7.15; wethers, $5.50 to $6.50; ewes, $5 to $6; clipped lambs are quoted at $6 to $7, and the Texas grassers offered so far have brought $5.40 to $5.80.

Selected Quality

OWL BRAND COTTONSEED MEAL. No stock feeder should be without it. Feed a balanced ration. Write for our free booklet, "Science of Feeding." **F. W. Brode & Company, Memphis, Tenn.**

STOCK AND ALFALFA RANCH FOR SALE—7 quarters deeded and 9 quarters leased land, all in one body. Good improvements; plenty of spring water. Land one mile to county seat. 350 acres of this land will grow alfalfa by sub-irrigation. Cut 5 crops last season. Only alfalfa proposition in this section. Can sell all the baled alfalfa you can raise at your door for from $16 to $25 a ton. Price $10 an acre for the deeded land. Address owner, **W. P. Bailey, Springfield, Baca County, Colorado.**

QUESTIONS AND ANSWERS.

(Continued from page 6.)

urine from a jennet when she is in heat, put in a very small amount of glycerine to keep it from losing its strength. Get the mare all ready and pour some of this fluid on her tail where the jack can smell it. Have lots of patience. Treat the jack very kindly. If the mare makes any fuss put a twitch on her right away. Work with the jack for a long time before you give it up. If everything else should fail then you will have a jack that will work only when he sees a jennet, which is very disgusting to say the least.

TRIPLETS—I would like to ask a question about a mare having triplets. It was always my understanding that it took one ovum for a colt. If a mare produces two "ovas" at a time she will have twins. She only has two "ovas," and where does the third colt come from?—Nebraska Subscriber.

REPLY—The mare has two ovaries. One ovum (egg) is usually discharged at a heat period. In cases two ova are discharged at or during a heat period. These may be discharges from one ovary or each ovary may discharge one ovum. There are a few cases on record where the mare has produced triplets. Some writers contend that the nucleus consisting of a fertilized ovum is divided. This may happen with both ovaries, at or near the same time. Other writers contend that the ova lives from one heat period to the next, as in the case of a pair of twins, one being a horse and the other a mule, with services three weeks apart.

NOT AGAINST THE LAW—Was it ever against the law to use the impregnator in the state of Nebraska? Some people here think so. They also think that capsules cannot be used.—Nebraska Subscriber.

REPLY—It is not against the law to use the impregnator and capsules anywhere in the world, but there ought to be a law compelling stallion owners to pass a certain examination before they can stand their stallions or jacks for public service. The individuals who talk about such a thing being against the law wish to retard progressive horse breeding, and those are the ones that know little about the business or they would not make such ridiculous arguments.

BREEDING MARES AFTER THEY HAVE ABORTED—Owing to shortage of feed and extremely severe weather, many mares slipped their colts during the month of January. In your opinion, will there be any danger of infection to stallions to breed these mares the coming season?—South Dakota Subscriber.

REPLY—There is danger of carrying infection from one mare to another. Every mare owner that is honorable should tell you if his mare has lost her colt. These mares ought to have been attended to by a qualified veterinarian immediately after aborting, then there would be little danger. It will be better for you to select a clean, healthy mare to make the natural service on, and breed these mares with capsules. Wash your hands carefully with soap and water between the services, with capsules, on mares of this kind.

SLOW STALLION—I have a stallion that is very slow, especially with mares that have young colts. Could you suggest anything to do? He is a very sure horse and gets fine colts.—Wisconsin Subscriber.

REPLY—Just before you are ready to make a service take the bridle off

and make the service with the halter on the stallion. He is probably afraid of the bridle. Be gentle with him. Most slow stallions are made so from abuse or from being kicked. Mares having colts are usually nervous—they are afraid the colt is going to be hurt, and frequently do more or less kicking. A greater per cent of foals can be had on nine-day mares with capsules than can be obtained with the natural service, for this reason. If you will get a mare in good heat, and turn this stallion loose with her, you may learn something about whether he is slow or not. There is very little use of having a slow stallion, as it is natural for them to serve mares, but there is one redeeming feature with a stallion that happens to be a little slow—they are nearly always sure.

BREEDING YOUNG MARES—At what age should a young mare be bred?—Texas Subscriber.

REPLY—Each 2-year-old mare that is well developed for her breed and age, should be bred when two years old. They are more likely to continue as regular breeders and make better brood mares, providing they are well taken care of. It should be remembered that there are two bodies to be nourished instead of one in all pregnant females, and it requires more nutritious feed to keep them growing. A well developed 2-year-old may not fertilize at the first or second service owing to the excitement, but they should fertilize after this excitement, better at two years of age than the average three or four year old, on account of the difficulty they are having with their teeth.

USING CAPSULES—I am a reader of your paper and I would like to know how to use the breeding capsules. Can they be used without the syringe?—Missouri Subscriber.

REPLY—Occasionally one will find enough semen in the vagina to partly fill the capsule, but when the hand is once inserted into the vagina the contents usually fall out if the discharge is in the vagina, so that to fill enough capsules to breed several mares from one service is not practical. After the capsule is in the vagina it is usually difficult to insert it into the uterus, if the neck of the womb should be slightly bent, as the capsule will dissolve, unless the operator is very quick. We do not know of a single breeder who has made a success of this way of breeding from a commercial standpoint. A few have been successful in occasionally getting a shy breeding mare in foal, but the principal mission of the instructions for scooping the semen up, is to destroy the capsule system. It is usually advocated by some stallion dealer who is afraid that the capsule system will ruin his business. There are thousands of men who have made a success both from a financial standpoint and from settling shy mares by using an extractor to obtain the semen in the regular way. There are a lot of doubtful mares that should be bred with capsules, which the stallion should never serve. Many of these have a very tight cervix and it would be very difficult to use the capsules on them when both sides of the capsule was wet, but the most difficult proposition, and the one that is most liable to happen at a serious time, is that all the semen might go into the uterus. Then it would be impossible to fill a capsule without an extractor. On mares that are clean and free from infection, and in a breeding condition, nine times out of ten the principal part of the semen will be found in the uterus, so that the scooping up process is a failure. The best way to find out which is the best method, is to try both ways. Usually a trial will convince the breeder that the scooping up process is a failure. If there is on breeder that has made a success commercially, in obtaining the semen without an extractor the editor of this paper would go across the continent to visit him. The difficulty always has been in artificial breeding to get the semen, but anyone should be able to get it every time the stallion or jack discharges, with the Carlson Semen Extractor.

RECORDING JERSEY HEIFERS—I have a full blood Jersey cow, but the one I bought her from has moved away and I cannot get papers. Now, I have two heifer calves, from a registered sire. First, how shall I go at it to register the calves, and what grade would they be, or could they be registered as full bloods?—Washington Subscriber.

REPLY—The American Jersey Cattle Club, the American Record Association for Jerseys, will require that the dam be registered before registering the heifers. If you think there is a possibility of getting the dam registered, write the facts in the case to J. J. Hemingway, secretary American Jersey Cattle Club, New York City.

DISINFECTING A STALLION—What can I use as a disinfectant on my stock after serving a mare that has lost her colt, so as to not carry the germs to the next mare bred? Would a disinfectant used as a wash be liable to kill the germs in the discharge from the horse, and cause the mare to not get in foal?—Kansas Subscriber.

REPLY—It is better not to use any fluid on the penis, but as safe a wash as can be used with effect, is as follows: Take a teaspoonful of Cresol to a gallon of water (have the water warm) and wash the penis as the stallion comes off. Many breeders use cold water, but a stallion is frequently injured by the use of cold water. Keep the stallion's sheath clean by using bran and warm water. Poke handful after handful into the sheath, which will come out later and leave the surface of the sheath smooth and healthy, so that there is less danger of infection. You cannot wash the penis clean enough with any antiseptic to prevent the stallion carrying infection from one mare to another. If a mare has aborted she should be treated with the barren mare treatment given in the April 5th issue.

FOUL SHEATH—What is wrong with one of my stallion's sheath? It has a black, sticky, and bad smelling appearance. If I let him go over two weeks without washing him out his sheath swells, and on the inside of the sheath it gets very foul. His penis is not affected at all. I use the bran remedy as advocated in the American Breeder.—Idaho Subscriber.

REPLY—Use the bran as warm as the stallion can comfortably stand it, and rinse with warm water, containing a teaspoonful of creolin to a gallon of water. Add one ounce of sugar of lead, to a quart of water and wet the part of the sheath complained of twice a day with the same. For this purpose a small piece of absorbent cotton may be used, which should be thrown away and new cotton used each time. Repeat the cleaning process as often as necessary to keep the parts in good order.

BONY GROWTH—I own a four year old one-eighth Clydesdale mare that weighs 1,500 pounds, due to foal May 19th, which was bred to a pure bred Clydesdale horse. Last October a lump started to form on the left side of her nose, about half way between her eye and the end of her nose, which has grown so large that it fills the palm of a man's hand. This lump is not sore, but is as hard as bone, and shuts the wind partly off on the one side. It has stopped growing now. I have engaged the best veterinarian I can get and he said it was caused from two teeth that she should have shed. He pulled the teeth, which were long, ulcerated and hard to pull. This was done last December, but the lump gets no smaller. The mare eats and drinks well, but when it comes to just ordinary work, she cannot get her wind fast enough.—Nebraska Subscriber.

REPLY—These bony growths are very slow to absorb, even when their cause is removed. We would suggest that at intervals of about three weeks

(Continued on page 13.)

TRACTION ENGINE FOR SALE.

Or will trade for good Mammoth jack. The engine is a 15-horse power Advance Traction. **Torrens Bros., Glenwood, Pope County, Minnesota.**

Jack Sores Cured

By Using Jack Sorine. Sold With a Cash Guarantee.

We guarantee Jack Sorine to cure any sore on the legs of a jack or stallion, no matter how long it has been sore or what caused it. You know we have a good, reliable remedy or we could not guarantee it to cure all sores on the legs of stallions and jacks, without any restrictions. It is put up in tin boxes, six inches long, three inches deep and three inches wide, and sent promptly my mail. It is a paste and applied with a small brush three times a day.

Send money by bank draft or P. O. money order. Price, $5.00.

Blue Mound, Linn county, Kansas

MISSOURI JACKS, PERCHERON AND SADDLE STALLIONS.

For sale at reasonable prices. One extra good Jack for Jennets. All stock old enough for service, have been tried and will be guaranteed breeders. No trouble to show stock.

Farm 5½ miles south of Cameron, 35 miles east of St. Joseph and 54 miles northeast of Kansas City, on Burlington and Rock Island railways. **Isaac C. Lohman, Turney, Clinton Co., Mo. R. F. D. No. 3.**

POLK COUNTY JACK FARM

Has a nice lot of jacks on hand yet for sale. All black, with white points, and all broke to cover.

R. M. Johnson, Bolivar, Polk County, Missouri.

Fairview Jack and Jennet Farm

A fine assortment of the best Mammoth jacks and jennets that grow, 14½ to 16½ hands high; jacks with lots of bone and substance. Everything guaranteed as represented. Prices right. Address

J. C. Huckstep, Eolia, Pike Co., Mo.

JACKS AND JENNETS FOR SALE

I have 25 head of jacks on hand and 40 jennets that I can sell cheaper now than in the spring. If you want to make more money on your feed than you ever did before, and have stock used to its new home when the breeding season begins, come and see what I have. **Philip Walker, Moline, Elk Co., Kansas.**

THE KENTUCKY JACK FARM

Established 1884

BREEDER of registered, Mammoth Kentucky jacks and jennets; big bone; plenty of weight. Forty head of 3 and 4-year-old jacks; also young stock for sale. Would be pleased to have you visit my farm for inspection or write for prices. I guarantee to please you. **Joe E. Wright, Junction City, Boyle County, Kentucky.**

JACKS AND MULES

300 head of Colorado raised Jacks, Jennets, Mules and Brood Mares. All guaranteed. Prices right. Lewis Swink & Son, Rocky Ford, Otero County, Colorado.

When Buying a Jack

Isn't it safer to buy him of the breeder? I still have some 15 jacks on hand; big, husky, young Missouri jacks.

Scott J. Miller, Chillicothe, Livingston County, Missouri.

TWO BLACK TENNESSEE JACKS.

15 hands; 5 years old. Work well; colts to show. Price $500 and $900 Would trade for draft stallion or jennets. John Oesch, Sr., Garden City, Cass County, Missouri.

Our Harness Horse Talk

Pedigrees Are Studied When It Comes to Picking Youngsters for the Races. The Forbears of Contestants for a $2,000 Purse.

Written for The American Breeder, by Henry Ten Eyck White.

TOUCHING on the matter of racing two-year-old trotters, concerning which Mr. Geers, in a recent talk with me, expressed adverse views, I was much interested on receiving from the management of the Readville grand circuit track a list of the entries to its purse of $2,000 for foals of that age, to be decided next August.

A few years ago the idea of racing 2-year-olds mile heats in midsummer would have been hooted at, but when Detroit put on an even of that sort two years ago and Necia marched the second and third heats in 2:13¼, 2:14½, after Azoff had won the opening round in 2:14¼, furnishing a grand contest, the public was keen for the new dish in sport, and now the Eastern tracks in the "big ring" are coming to it.

When the Detroit race was trotted one thing that struck me forcibly was the fact that the two heat winners were the product of developed sires and dams and that their ancestors were developed to a remarkable degree. Necia was by Bellini, 2:13¼; dam, Nettie King, 2:20¼; while Azoff was by Peter the Great, 2:07¼, dam Dolly Worthy, 2:27½, by Axworthy, 2:15½; he by Axtell, 2:12. Now, when I see a list of the entries to the 2-year-old purse to be trotted in New England next August I am amazed at the percentage of the entrants that have record trotters for their sires, their dams, and the sires of their dams. A purse of that character, where the entry is liberal and comes from more than one section of the country, is a good index of the trend of modern breeding, and likewise it shows what sort of 2-year-olds are likely to be named by breeders, because it is mostly on pedigree that the confidence which enables a man to name an untrained 2-year-old is based. So I made the necessary research and give herewith a table showing how the youngsters named at Boston are bred and what proportion of their immediate ancestors bear records:

Name.	Sire.	Dam's Sire.
Judge Maxey	Axworthy, 2:15½	Prodigal, 2:16
William J.	Cochato (3) 2:11½	Bow Bells, 2:19¼
Princess Alcoma	Mikado, 2:20¼	Beau Ideal, 2:15½
Black Filly	Audubon Boy (p) 1:59¼	Bingen, 2:06¼
Belzona	Bingara	Kremlin, 2:07¾
Byrsa	Bingara	Kremlin, 2:07¾
Bevan	Bingara	Kremlin, 2:07¾
Nathan Axworthy	Axworthy, 2:15½	Prodigal, 2:16
Bay Filly	Joe Dodge	Baron Review, 2:21¼
Hollyrood Bertha	Joe Dodge	The Viceroy
Hollyrood Jennie	Joe Dodge	Silk Weaver, 2:19½
Miss Arie	King Bingen	
Chestnut Filly	Peter the Great, 2:07¼	
Baring's Comer	Baring, 2:19½	Kremlin, 2:07¾
Virah	Vice Commodore, 2:11	Onward, 2:25¼
Viceburn	Vice Commodore, 2:11	Wilton, 2:19¼
Vileen	Vice Commodore, 2:11	Clay King, 2:27¾
Tres Bien	Baron Direct	Ky Belmont
Mayflower	The Harvester, 2:01	Alcazar, 2:20½
Cegantle	Tregantle, 2:09¼	Cecilian, 2:19¼
Zeppo	Zombro, 2.11	Baron Wilkes, 2:18
Justora	Justo, 2:08¼	Alfred G., 2:19¾
Peter Bells	Baron Peter, 2:28¾	Electric
Dolly Hale	Senator Hale, 2:10¼	Red Wilkes, 2:40
Nowaday Girl	McDougall, 2:10¼	Lookaway, 2:22½
The Artisan	Aquilin, 2:19¾	Jay Bird, 2:31¾
Geo. Gibbs	Binvolo, 2:07¾	Jefferson
Dillon Axworthy	Axworthy, 2:15½	Sidney Dillon
Lady Zombro	Zombro, 2:11	Bingen, 2:06¼
Bay Colt	Zombro, 2:11	Diablo (p), 2:09¼
Bay Colt	Vice Commodore, 2:11	Bow Bells, 2:19¼
Kitty Kelly	Peter the Great, 2:07¼	Directum Kelly, 2:08¼
Review Tell	Baron Review, 2:21¼	Axtell, 2:12
Belle Chimes	Bingara	Chimes, 2:30¾
Direct Bingen	Binegn, 2:06¼	Directum, 2:05¼
Martini	Bertini, 2:22¼	Ponce de Leon, 2:13
Floss Watts	Gen. Watts, 2:06¾	Expedition, 2:15¾
Derby Axworthy	Axworthy, 2:15½	Chas. Derby, 2:20
Lady Mac	McDougall, 2:10¼	Allerton, 2:09¼
Tulita	Senator Axworthy, 2:28¼	Hummer
Carsto	Carlokin, 2:07½	Vasto, 2:16½
Alma Brook	King Red, 2:20¼	Alfonso, 2:29¾

How the youngsters are bred in the male line the above table shows, but it does not show their dams, many of which have fast records at the trot. The first colt on the list, Judge Maxey, is from Helen Hale, 2:13¼ as a 2-year-old, and at maturity sold for $8,000 as a broodmare. Ever since a Prodigal mare produced Gen. Watts, a champion 3-year-old, there has been a demand for the matrons of that family. Helen Hale, sold at a big price, could not have brought the money on her racing form, as she was beaten the race she took her record in by Binvolo. Another Prodigal mare that figures in the above list is Bertha Bennett, 2:14¾. She took that record as a 4-year-old but was a wonderfully speedy trotter as a yearling, showing a quarter in :35 at that age. Bertha Bennett did not win a lot of races, but that fact helps her with some people, as the mare not campaigned severely is fancied by many when it comes to raising a foal.

Another great colt trotter that is dam of one of the above 2-year-olds is The Leading Lady, by Bingen, her foal being Lady Zombro. The Leading Lady was a star 2-year-old, racing to a mark around 2:16 early that season, but when it came to beating the pick of the land at Lexington she was not heard of, nor was her work as a 3-year-old of greatly different calibre, although at that age she made herself champion 3-year-old trotting filly by a mile against the watch in 2:07. But the modern breeder is not so insistent on high class racing performances in a 2 or 3-year-old filly he wants for a brood mare as he used to be. Great natural speed and purity of gait is what he is after, all other things being secondary. A common bred one that can fairly fly at the trot and puts its feet down right will far outsell another that is bred in the purple but lacks the "lick" that now is regarded as essential—or at least greately to be desired—in the dam of a prospective colt trotter.

Some people said The Leading Lady could not win the Kentucky futurity as a 2-year-old because of her sire, Bingen, her dam being a record daughter (Miss Heir-at-Law, 2:17¼), of the best son of Mambrino King. Heir-at-Law was a double gaited horse, a race mark being 2:12 and his pacing one 2:05¾. Minor Heir and others have stamped him a good sire, so when his granddaughter was beaten the Bingen end of the pedigree had to bear the blame. Yet Bingen easily is the most notable trotting stallion alive today, because he is a progenitor as well as a sire. His blood breeds on from one generation to another with a potency shown by that of no other horse in the history of trotting, and his son, Uhlan, is champion trotting gelding. It is true the Bingens of the first generation are not as good colt trotters as the representatives of other families, but there is one son of Bingen that already gets colt speed of high class, and others unquestionably will do so. Without the peculiar form of potency which enables it to pass from generation to generation, carrying all its good qualities, the blood of any sire can have only a temporary triumph. Breeders have seen many families that in their day were right at the front pass away utterly. Who talks of the Volunteers, for instance, and yet that family once was supreme on the race track, but it failed in the breeding ranks and today is forgotten by all but a few?

In the above list there is one entrant, Direct Bingen, in whose pedigree the Bingen blood is hooked up with a strain that never knew what it was to cry quits—that of the mighty Directum. Consuela S., dam of Direct Bingen, was a high class race mare, and the day she won the $10,000 Massachusetts purse at Boston with Charlie De Ryder driving her she was a race horse among a thousand. Since then the old mare has had some foals by the Butler stallions, Directum Kelly, perhaps, but I would think the Bingen cross an ideal one for her from every point of view.

The Directums keep trying, and they come naturally and honestly by that trait. Their sire would try when he was in pain from racked joints and tender feet. Their grandsire, Director, would try all day, and won a lot of important races. That is the strong point of the Dictator blood, today, and always has been. It never was a prolific strain as to percentage of foals got by any of its principal members, nor was the speed output to be compared, mare by mare, with that of other families. But when the speed did come there was a world of gameness to back it up and enable it to do great deeds on race day—and in the long run that is what counts.

The colt, William J., in the above list, is an interesting study to people who like to mess with blood lines and hereditary tendencies and the like. William J. is by Cochato (son of Bingen and a record daughter of Pistachio, brother of Nutwood), and his dam is by Bow Bells, son of Electioneer and Beautiful Bells. As Bingen is by May King, son of Electioneer, and has a double dose of of George Wilkes blood on the female side of his pedigree, the whole proposition simply is fascinating to people who place pedigree above everything else, and incidentally it has charms for the class who regard records as the foremost factor in the making of a colt trotter.

Cochato was a colt trotter, taking

SEASON OF 1912. $25.00

The above cut is of Rex Donnell 2042. The greatest in natural style at both ends, and with more gaits and as perfect as they are naturally performed by any living stallion in Missouri today. Two of his colts (7 and 8 months old), selling in February, 1912, at auction for $1,100. Mares from a distance kept at actual grain cost. Pasture likewise.

For Sale—Registered Saddle Mares and Geldings. Write for descriptive catalogue.

Dr. W. E. Cheatham, Proprietor Breezy Point Stock Farm, Excelsior Springs, Clay County, Mo.

REGISTERED MORGAN HORSES

FOR SALE—Coming 2, 3 and 4-year-old stallions of large size, fine breeding and great style and action, high headed, clean boned and heavily muscled—the greatest all-purpose horse the world has ever known; fearless and untiring goers, but so level-headed that any lady can drive them; The Admiral 4871 A. M. R., 15¾ hands, weight 1,250 pounds, at head of stud. He was sired by Jubilee De Jarnet. Prices moderate. Send for catalogue.

RICHARD SELLMAN,
Mountain Vale Ranch, Rochelle, McCulloch County, Texas.

Shetland Stallions TO LEASE

Small guarantee required. All ages and sex for sale; send for price list.

Geo. H. Simpson, Wheaton, Dupage County, Illinois.
25 Miles West of Chicago.

Saddlers For Sale

At private contract, I offer for sale the most fashionable strains and superb individuals in stallions and mares and fillies, by such sires as Rex McDonald 333; Rex Monroe 2063; Star McDonald 2526, and Fos McDonald 3096. All bred and developed by me. H. A. Greenwell, Lakenan, Monroe County, Missouri.

NAVAJO PONIES.

For Sale—One or two car loads of Navajo Ponies; $12 to $20, on cars, Albuquerque or Chama.

Haynes Bros., Haynes, Rio Arriba County, New Mexico.

SINGLE COMB BROWN LEGHORNS

Eggs. The great all year laying strain. None better. My method for range insures strong, vigorous chicks, with vitality. Satisfaction guaranteed. Eggs for sale, $1 per 20; $2.50 per 50; $4 per 100 eggs.

Mrs. H. A. Brookhart, Arabela, Scotland County, Mo.

STAPLES' BLACK LANGSHANS—Great winter layers. Some choice young cockerels, the best I ever raised. Some choice Duroc Jersey swine, young stock; male, females. Write today. Plainview Farm, Mrs. Jas. A. Staples, Mgr., Lamonte, Mo.

"Rippin' Good 58826"

Standard bred **BAY STALLION,** foaled 1906. Sired by Larabie the Great 2:12½ (by Jay Bird, by George Wilkes), dam Kittie Director, by Director Chief 10440 (by Director 2:17); grandam Kitty Phallamont, by Phallamont 3175 (by Phallas 2:13¾); third dam Edmonia, by Dictator 113; fourth dam Leah, by Woodford Mambrino 2:21½; fifth dam Maud, by Abdallah 15. Just study this pedigree for a moment. It will bear the closest examination. All of it producing blood, valuable blood, and the kind that sells well. Three crosses to Dictator, three to Abdallah 15, three to Henry Clay, and all good ones. Larabie the Great was a good race horse and a sire of race horse trotters. This is great breeding and the horse is just as good as his pedigree. He has size, substance, style, quality, good looks and is A1 in every respect. This young stallion is for sale, and I mean business.

Before the death of Mr. Miller, whose business I managed, we refused a long price for this horse. Now the administrator orders the stock sold and one-third the money will buy this horse. He has been exercised daily and is ready for service.

We also have for sale the Percheron stallion, Imp. Eaderon, black, heavy boned, licensed under Kansas state law, good condition, ready for service.

Also Welsh ponies from imported stock.

MILLER INVESTMENT CO.,
F. M. Lorimer, Mgr., Olathe, Kas.

Nevius' SHORT-HORNS and POLAND CHINAS

Good young bulls, reds and roans by our herd bulls, also few good boars ready for service. Write or come and see them. Mention this paper.

C. S. NEVIUS, CHILES, KANSAS

a record of 2:11¼ at 3. His sire trotted at 2:12½ at the same age, and was by a 2:20 stallion and out of a 2:20 mare, the latter to high wheels. Bow Bells, one of a famous family that includes Chimes, Bell Boy, Belsire and St. Bel, could trot early, and his ultimate record was 2:19¼. But Bow Bells today is valued more for what his daughters can do as brood mares than for the accomplishments of his sons as sires of speed at the trot. In fact a large percentage of the foals of Bow Bells inclined to the pace if left to their own devices in the matter of gait and his fastest performers are pacers. They are a high strung family, just as are the Prodigals, and it is from families with this trait the best brood mares are most likely to come, as witness the daughters of Seely's American Star, which produced the first notable foals of Rysdyk's Hambletonian; and the females of the Mambrino Patchen family, which gave George Wilkes his start in Kentucky and kept him going till he died.

So when one considers the extended pedigree of William J. from a purely academic standpoint the colt himself figures out to be the possible making of a great colt trotter. Hence his turf career is going to be closely watched by the men who believe a proper pedigree is the foundation of all equine greatness.

NOW OWNS THE THREE CHAMPIONS.

The champion trotting stallion, The Harvester, 2:01, has been sold to C. K. G. Billings at a price said to be above $50,000. Mr. Billings now owns the champion trotting mare, Lou Dillon, 1:58½, the champion trotting gelding, Uhlan, 1:58¾, and the champion stallion. The Harvester sold at auction as a three-year-old for $9,000, and the price at that time was thought to be in excess of his value. It is announced that Mr. Billings' three champions are to be taken on an exhibition tour, one of the countries in which they are to be shown being Russia, where Creceus, the then champion trotting stallion, went several years ago, having been purchased by the imperial government.

Mr. Billings has paid enormous prices for some of his horses. Lou Dillon was purchased in 1907 for $12,000, The Monk $15,000 and Uhlan for $35,000. In 1906 Mr. Billings was offered $50,000 for Major Delmar, but turned down the offer.

MISSOURI SADDLE HORSE BREEDERS ORGANIZE.

At a meeting held during the public sale of roadsters and saddle bred horses, conducted by James Houchin of Jefferson City, Mo., a Missouri branch of the United States Army and Remount Association was organized. This is a part of a general movement inaugurated by the War department in connection with the big saddle horse interest and increasing the output of animals suitable for cavalry service, and rendering more popular the use and enjoyment of horses belonging to what is generally known as the pleasure classes.

BURDOCK FOR STALLIONS AND MARES.

W. B. Ewalt, one of our Texas subscribers, writes that he has been much interested in the breeding subjects discussed in the American Breeder, and proposes the following new subject, which he would like to hear from on the part of any one who has had experience and observation, namely, the feeding of pulverized burdock root to stallions and mares as a conditioner.

In the recent public sale conducted by James Houchin, the principal contributor, at Jefferson City, Mo. Prices for saddle and harness horses ranged from $125 on an unnamed colt, up to $1,375 paid for King of the Heavens, of Mr. Houchin's consignment.

QUESTIONS AND ANSWERS.

(Continued from page 11.)

you apply the following blistering operation: Powdered cantharides, one-half ounce; biniodide of mercury, two drams; lard, four ounces. Mix all together and rub well into the skin over the enlargement, with the hand for several minutes. Allow to remain on for 24 hours, then wash off with warm water and soap, and apply a little lard for a few days, to keep the skin soft. You may find it necessary in the event these applications do not give relief in a few months to have your veterinarian remove the growth by surgical means. The encroachment of the solid mass on the nasal chamber is responsible for the defective wind.

QUITTOR—I have a horse that has been lame in the right hind foot ever since the first of February and I guess from what I can read that it is a quittor. Please let me know what to do for it.—Illinois Subscriber.

REPLY—The term quittor is usually applied to those chronic fistulous conditions about the coronary band of horses, and for the reason that they frequently involve the lateral cartilage they are often difficult to cure without surgical interference. Try a daily injection of tincture of iodine deep into the tract for four or five days; then apply every second day for ten days.

PERIODIC OPHTHALMIA—I have a Percheron stallion that I think will lose his eye. At times he can see very well, but once a month his left eye gets very red, and in a short time it has a milky look, and you would think then that the eye was out. In a few days it will get better. It is when the moon is dark that his eye is so near out. Is he moon blind? It is not in both eyes at the same time. What can I do for him?—Arkansas Subscriber.

REPLY—We fear from your description that your stallion is affected with periodic ophthalmia which, as you perhaps already know, is a very intractable disease. During these periods keep the animal in a dark stall and apply a clean pack of absorbent cotton to the eye affected, which keep wet at short intervals with a cold corrosive sublimate solution. Make the solution one of the drug to 2,000 of the cold water, which latter should be boiled in advance for use. Cororsive sublimate may be obtained at any drug store and the druggist will explain how to make the proper dilution. The feed should be of a laxative nature, and heating grains fed sparingly to an animal affected in this manner. Avoid bright sunlight.

WORMS—How much lye is safe to feed hogs mixed with slop for the prevention of worms?—Missouri Subscriber.

REPLY—When lye is fed at rather short intervals fo rthe purpose mentioned a tablespoonful may be dissolved in hot water and added to a barrel of slop.

CLOSED OS—I examined two mares last season in which the neck of the womb was very long and crooked with a "striffing" growth to the end, seemingly about one-half inch long, and there was no entrance through it, that I could find. Will you please give the cause and remedy?—New Mexico Subscriber

REPLY—You do not state whether or not these mares have ever produced foals. Sometimes closure of this canal is congenital, sometimes it is occasioned by disease and at other times from having suffered laceration at the time of foaling. The proper time to make a critical examination is during the heat period, for at that time the parts are more relaxed than when estrum is not present. It frequently requires persistence to effect an opening, but in the majority of cases it can be found.

FOUL SHEATH—I have a stallion colt, and when I took him from the mare to wean last fall, his sheath was as foul as any old horse I ever saw, and last week his sheath was more foul than ever. I gave it a good washing last fall, too. The stuff which forms on his sheath is black and gummy. What is the cause of this, and what can I do for it?—Missouri Subscriber.

REPLY—Wash the sheath of your colt, using the bran mash as prescribed under another inquiry in these columns. Repeat as often as necessary, to keep the sheath clean. Use no soap or grease for these will only make conditions worse. Add a teaspoonful of creolin to a gallon of warm water to rinse the sheath. It is likely that the condition is aggravated by the filth causing an unusual secretion of the glands located within these parts which favors the accumualtion of dust at the entrance of the sheath, making a very foul and repulsive condition in a short time.

BUCK KNEE—One of my neighbors has a fine mule colt from one of my jacks. He is buck-kneed. What can I do for him?—Missouri Subscriber.

REPLY—As a rule it is not necessary to do anything for these young things, for the reason that they incline to outgrow these deformities in time.

LAME MARE—I have a three year old mare of Coach and Hambeltonian cross. I shod her and drove her quite hard this winter and she got lame gradually in her front legs. So I removed the shoes and quit driving her and she is still lame. I can't locate the trouble, but think from the action of her leg it is in the foot. I didn't treat it in any way. She has been lame for two weeks.—Nebraska Subscriber.

REPLY—With no description of symptoms we are in the same position as yourself—unable to locate the difficulty. A three-year-old is too young to carry shoes and do hard service over roads such as have prevailed over a great section of the country during the past winter. We would suggest that unless you have an opportunity to have your animal examined by a qualified man with a view of determining the exact location and nature of the lameness that you turn her out to grass for the season. An animal of her age has not reached a sufficient point of maturity to withstand hard service, and there is quite a chance that she will gradually outgrow the lameness if given an opportunity.

CLEANING THE SHEATH OF STALLION—What is the best method of cleaning a stallion, and about how often should he be cleaned during the breeding season?—Minnesota Subscriber.

REPLY—One of the most effective as well as satisfactory ways of cleaning the sheath of a stallion is to first prepare a warm bran mash, of rather sloppy consistency. Introduce handfuls of the mash into the sheath and rotate it about gently until every particle of the filth is dislodged. With a large fountain syringe filled with water at body temperature, wash out the bran. This method does not provoke any irritation of the part cleaned, neither does it leave the operator's hands foul smelling from the odor of a filthy sheath. As to just how often a stallion's sheath should be cleaned depends upon the stallion himself. No fixed number of times can be prescribed, but the parts should always be kept clean, yet should be washed no more than actually needed.

STRINGHALT—I have a stallion, nine years old, weight 1,400 to 1,500 pounds. He has a habit as if he was string halted, just at certain times, when he turns a certain way. What would you call that? Is he somewhat stringy, or is it just a strain on his legs from serving or from some such cause as that? What can I do for it?—Missouri Subscriber.

REPLY—The exaggerated movement of the hind limbs commonly recognized as stringhalt, is not always due to disease or disturbed functions being located at some certain place. In some cases it is aggravated by cold weather, being worse during the winter season. A horse will frequently appear to be stringy when lame in front, especially when turning, which condition will entirely disappear when recovery from the lameness takes place. We would judge that your animal is only slightly affected, but it would be a good plan to have him submitted to a critical examination by a competent veterinarian at your first opportunity.

Great Shorthorn Offering

40 head of high classed Scotch and Scotch topped cattle

HASTINGS, NEBRASKA, MAY 1, 1912

This offering will consist of 18 bulls and 22 females. The bulls are a strong, serviceable lot sired by such bulls as Champion Goods, Improved Goods, Roan Goods, Parkdale Champion, Victor Archer and others. A number of these are of show-yard character and good enough to head any herd. The females are a splendid lot, carry plenty of scale and quality, and represent some of the best Scotch and Scotch-topped families of the bseed. They are either well along in calf or will have calves at foot by Improved Goods, Roan Goods or Champion Goods. Every animal going in this sale has a life of usefulness before it. For catalog address,

R. C. FIRME, Hastings, Nebr., or A. A. STONE, Hansen, Nebr.

Auctioneer—Col. George Bellows.

Herefords and Percherons

Nothing in the way of pure bred live stock offers better opportunities at the present time than Hereford cattle and heavy horses. At no time within the next ten years will cattle be as low as now. This is the time to buy Hereford breeding stock—right now at grass. If you want good, dependable Herefords, offered in the best of condition and choicely bred, attend the John H. White sale, to be held at the farm near

GRANGER, MO., WEDNESDAY, MAY 1, 1912

40 COWS, HEIFERS AND BULLS.

All choicely bred and in excellent breeding condition. There will be 16 mature cows, mostly with calves at foot. Thirteen very choice two and three-year-old heifers, all my own raising, mostly the get of Granger, my former herd bull, sired by Hesiod 29th, and bred to the Generous bull, Dandy. SEVEN BULLS from 12 to 18 months old. These are good, and ready for service and are big, rugged bulls in good breeding condition, with good heads and horns.

TEN PERCHERON MARES—I will also sell five registered Percheron mares and five high grade Percheron mares; the latter in foal to a $2,000 stallion. Will also sell one Highlander stallion.

Write for catalog of this sale today, mentioning The American Breeder.

John H. White **Granger, Mo.**

COL. FRANK J. ZAUN, AUCTIONEER.

CLYDESDALES

AVONDALE STUD FARM has on hand the greatest collection of CLYDESDALE STALLIONS to be found on the Continent. The best FIVE CLYDESDALE STALLIONS at the 1911 IOWA STATE FAIR were shown by them. Visit their stables where you can see more TON CLYDESDALES than all our competitors combined. If on the market, write them for catalog, prices and terms. Address,

Leitch & Sons

Lafayette, Stark County, Illinois

GALBRAITH'S CLYDESDALES

Famous the world over for three-quarters of a century. Present stock the best we ever had. No tail ends. Every horse we have is a show horse.

More international prize winning stallions over three years old for sale in our stud than all competitors combined.

Remember the Clydesdale is the coming popular breed and has won 80 per cent of all leading prizes in competition with the best of every other draft breed at Chicago.

ALEX GALBRAITH & SON, DeKalb, DeKalb County, Illinois.

CLYDESDALES.

I have a car load of Clydesdale stallions, selected by Robert Miller, of Stouffville, Ontario, from the best herds in Canada, that I will dispose of at as low prices as possible, considering their quality and breeding, to make room for another load. **R. O. Miller, Lucas, Lucas County, Iowa, R1.**

IMPORTED SHIRE.

For Sale or Trade—"Fordy Spark" imported number (23320), American number 8446, foaled 1904; bay, white face and white hind feet. Sound. Price $650, or will trade for large, sure jack or registered Percheron. **W. E. Carter, Batavia, Jefferson County, Iowa.**

NAVICULAR DISEASE—I have an eight year old horse that is sore and stiff in front. He went lame in his left front foot first, about two years ago. He has a good foot, soft and in good shape. I have used Gumbault's Caustic Balsam without sucess, and have soaked his feet in warm water. When he is at work, if he steps on a stone or anything that raises the toe, it hurts him more. I have had him shod with bar shoes and he was worse, then I had him shod with shoes with no toe calk, but high heel, and he went some better, but he is very stiff and sore now. Would a blister of canthriades do him any good?—Ohio Subscriber.

REPLY—From your description we fear your horse has navicular disease, which, if true, means that he is very likely incurable. We would suggest that you have him examined by a good, competent veterinarian and if our suspicions prove correct that you have the operation known as median neurectomy performed, which is the quickest and most satisfactory way of relieving these cases.

LICE—Have just read in the March 5th issue of the American Breeder about the kerosene emulsion remedy for lice on horses. Before using this remedy, I would like to find out what to wash the stalls and mangers with. Would you advise using the kerosene emulsion for that purpose?—South Dakota Subscriber.

REPLY—You will find the kerosene emulsion very effective for washing the stalls and mangers, but for this purpose a stronger solution of creolin or crude carbolic acid solution may be used than would be safe to use on the body of the animals. Use the emulsion as prepared or creolin three ounces to a gallon of hot water.

HEMORRHAGE—I have a mare that was bred April 11, 1911, that has been bleeding about four days. I believe the blood comes from the uterus as the urine is clean and bright. I think she is in foal. She eats well and looks fine. What could cause this, and what could be done for her?—Missouri Subscriber.

REPLY—It will be very necessary to know just what parts are affected before attempting to prescribe for your name, and would suggest that you have a qualified veterinarian make a very careful examination of the case.

Chas. Irvine, Ankeny, Iowa, reports the sale of the yearling Belgian filly with which he won at the International. He has also sold a very thick, sappy, yearling stallion and has, he writes, a number of deals pending that should clear out his stock satisfactorily. Mr. Irvine always has something to sell and he names "farmers' prices" only.

Taylor & Jones, Williamsville, Ill., write: We have been making many sales of late and The American Breeder has helped us to do so. Our new importation that arrived a few weeks ago is doing fine and now ready to sell and we have a few extra good ones we had been reserving to show this fall, some of which we could spare. Anyone wanting a real good Percheron, Shire or Belgian stallion at a low price can find him at our barns and with a guarantee we believe The American Breeder will say is absolutely good as a government bond.

One of our subscribers, Mr. T. W. McClure, of Ft. Cobb, Okla., has bought from Walker Bros., of Oklahoma City, a high class gray Percheron stallion, Felix 68989. Walker Bros., write that his sire and grand sire and great grand sire were among the greatest sires that ever lived, Besigue (19602) one of them, selling for $10,000 at 17 years of age. Felix as a two year old won first at Oklahoma and Arkansas state fairs, and was one of their gold medal prize herd in 1911.

Truman's Pioneer Stud Farm, Bushnell, Ill., writes. We have sold to Messrs. George M. McCray and D. M. Fowler of Fithian, Illinois, our noted International, Illinois and Iowa grand champion Shire stallion, Royal Grey, at one of the longest prices ever paid for a draft horse on this side. This horse will be remembered as the horse that caused such a sensation at the 1910 International as a two year old, being reserve champion to our $10,000 Dan Patch. He had the distinction of winning first and reserve champion at the different state fairs that year and last year as a three year old, was champion at the Illinois and Iowa state fairs and also at the International, and was pronounced by the leading judges of this country as being the greatest draft horse they had seen in the country. That noted English judge, Mr. Kirkham, remarked at the International, that in his opinion Royal Grey was one of the greatest horses of the breed. We have reserved the exclusive right to show this stallion at the state fairs next fall and also at the International. Royal Grey will be mated with one of the most select lots of imported Shire mares in the country. It was a pleasure to us this week to have a visit from our old customers, Messrs. King Brothers of Albion, Nebraska. They are breeders of pure bred Shire horses and they selected a rising three year old bay colt, Wrydelands Squire, an extraordinary upstanding high class colt that will no doubt do them a great deal of good. He is closely related to the International champion, Wrylands Starlight.

The Fraser Shorthorns, sold at Kansas City on the 11th, averaged about $92. The younger heifers sold fairly well, but the better cows with calves at foot, and the three bulls in the offering brought scarcely half what they were worth. When the sale opened only 20 men, outside the auctioneers, clerk and field men, were in the ring. A few others came later, but it was plain that the pressure of farm work and the scarcity of feed were preventing the interest warranted by the worth of the offering and the need of cattle on the farms. The top price, $150, was reached three times by young cows with fine calves at foot, and once by a fine heifer almost due to calve.

WANTED

Percheron mares, stallions or jacks, in trade for Industrial Stocks, Land or Automobile. **H. B. Alderson, Devils Lake, Damsey County, N. Dakota.**

Eight young jacks and two jennets are for sale by H. A. Schwatken, Hammond, Kas.

Some one wanting a traction engine can buy or trade to advantage by applying to Torrens Bros., Glenwood, Minnesota.

A proven cure for jack sores, discovered by a practical jack man and veterinarian, is advertised for sale under a guarantee in this issue. It is called Jack Sorine, and is made by O. P. Willson Serum and Instrument Co., 3754 Wayne Ave., Kansas City, Missouri.

A good chance to buy Shorthorn cattle at public sale will be offered by R. C. Firme and A. A. Stone, in their sale at Hastings, Nebraska. Mr. Firme's address is Hastings, Nebraska, and Mr. Stone's address is Hansen, Nebraska. Catalogs may be had by writing either party.

See Stetson Bros'. advertisement of a black Percheron stud stallion and four yearlings.

Truman's Pioneer Stud Farm, Bushnell, Illinois, received a new importation of Shires, Percherons and Hackneys on the 10th of this month, as announced in their advertisement.

Henry Lefebure, of Fairfax, Iowa, received a new importation of Belgians on the 18th. See his advertisement calling attention to same.

D. B. Gunn, of Red Oak, Iowa, who manufactures the Gunn Guider Road Builder, is making a bargain price for the three fine stallions and one jack which comprise his breeding barn.

An entire breeding establishment, including barns, books and three valuable stallions and one jack, is offered for sale by A. G. Bush, Fairland, Oklahoma. Look up the advertisement for particulars.

On May 1, John H. White, of Granger, Missouri, will sell at public sale 40 registered Hereford cows, heifers, and bulls, and ten Percheron mares. Of the Percheron mares only five are registered, but the five grades are in foal to a $2,000 stallion. If there is still time, write Mr. White for a catalog.

Oltmans Bros., of Wateska, Illinois, have some fine imported Percheron, Belgian and German Coach stallions, every one backed by a fair and square guarantee. Write them for catalog.

Rhea Bros., Arlington, Nebraska, will be pleased to give pictures, descriptions, prices or any information you may want of the excellent Percherons they have for sale. Their horses are acclimated.

Geo. W. Souers & Sons, of Huntington, Indiana, has a barn full of good Percheron, Belgian and Coach stallions, and refer you to their old customers, who they say are buying of them the second and third time. Read their ad in this issue.

J. O. Singmaster & Son, of Keota, Iowa, have post cards made of their Percheron stallions, and will be glad to send you one if you are interested.

W. H. Bayless, of Blue Mound, Kas., has some good jacks of his own raising, and ready for service, for sale cheap. Read his advertisement in this issue and write him.

Scott, Abney & Jenkins, of Virden, Illinois, have 20 big black jacks, with lots of size, bone, quality and style. Also 200 mare mule colts for sale. Read their advertisement in this issue and write them for catalog.

Two black Tennessee jacks are advertised in this issue by John Oesch, Sr., of Garden City, Missouri. Write him for particulars.

Write to H. T. Hineman, Dighton, Kansas. He has 25 Mammoth jacks, from yearlings to eight years old.

Three hundred head of Colorado raised jacks and jennets, mules and brood mares, all guaranteed, are advertised by Lewis Swink & Son, Rocky Ford, Colorado.

Read the advertisement of the Polk County Jack Farm. They have a nice lot of jacks on hand. All black, with white points. R. M. Johnson, proprietor, Bolivar, Missouri.

Scott J. Miller, of Chillicothe, Missouri, has 15 fine, big, husky jacks advertised for sale in this issue. Write him.

Al. E. Smith's Stock Farm, at Lawrence, Kansas, has 75 registered jacks and jennets, all registered. Also some good Percheron stallions for sale. Read his advertisement.

Fifty registered jacks and jennets, and every one a black Mammoth, is the advertisement of Ed. Boen, Lawson, Missouri. Mr. Lawson handles only the big boned kind. Write him for particulars.

"Two registered jacks, coming two and three years old; cheaper than dealers will sell," is the advertisement of J. W. Stormont, Dighton, Kansas.

A fine assortment of Mammoth jacks and jennets can be found at the Fairview Stock Farm. J. C. Huckstep, proprietor, Eolia, Missouri.

Twenty-five head of jacks, and 40 jennets are offered for sale by Phil Walker, of Moline, Kansas. Write him for particulars.

Joe E. Wright, Junction City, Kentucky, breeder of registered Mammoth Kentucky jacks and jennets, would be pleased to have you visit his farm and inspect his stock. He guarantees to please you.

W. P. Bailey, Springfield, Colorado, has a stock and alfalfa ranch for sale; seven quarters deeded and nine quarters leased, all in one body, with good improvements. Read his advertisement in this issue and write him.

Mrs. H. A. Brookhart, Arabela, Missouri, advertises single comb brown Leghorn's eggs. Mrs. Brookhart has a fine lot of chickens and guarantees the eggs. Write her.

F. W. Brode & Co., of Memphis, Tennessee, have an ad in this issue of their selected quality Owl Brand Cottonseed Meal. Write for their free booklet, "Science of Feeding."

D. B. Gunn, of Red Oak, Iowa, manufacturer of the Gunn Road Guider and Builder, offers to sell road builders on 15 days' trial. Write him for description and price.

W. B. Carpenter, of Trenton, Missouri, wants you to write him for a 96-page illustrated catalog, telling all about his Missouri Auction School, located at Trenton, Kansas City and Oklahoma City.

Write the Visio Remedy Association, 2475 Calumet avenue, Chicago, Illinois, if you have need of a cure for moon blindness. They refund the money if it does not cure.

Read the advertisement of the Chicago Flexible Shaft Co., at Chicago, Illinois, and write them for complete catalog, mentioning the American Breeder.

The Brown Fence & Wire Company, of Cleveland, Ohio, whose advertisement appears in this issue, will allow you to examine the Brown Fence and know just what it is before buying. Write them for sample showing size and quality of wire.

Walker Bros., of Oklahoma City, Oklahoma, have some extra good imported draft and coach stallions advertised in this issue. Many of them are state fair prize winners.

Write to F. O. Butler, Hinsdale, Illinois, for the catalog of Hackney stallions. They also have a few choice mares for sale.

H. A. Wehrman, Monticello, Missouri, has a registered Percheron stallion and three jacks for sale. Write him or go and see them.

H. Redenius, Rushmore, Minnesota, has an imported Percheron ton stallion; also imported Percheron mares. Read his advertisement.

O. N. Wilson, Kittanning, Pennsylvania, invites you to visit his farm and learn their method of doing business. Read his advertisement.

Write to the Spohn Medical Co., Goshen, Indiana, for a description of their cure for distemper, pinkeye, influenza and colds. Their advertisement appears in this issue.

Saddlers for sale, at private contract, the most fashionable strains and superb individuals, are advertised by H. A. Greenwell, Lakenan, Missouri.

Haynes Bros., Haynes, New Mexico, have two car loads of Navajo ponies for sale. If interested in ponies, write them.

Geo. H. Simpson, Wheaton, Illinois, has Shetland stallions to lease; small guarantee required. Read his advertisement.

All who want to take advantage of the opportunity to breed to the great imported champion Percheron stallion Imprecation (79214) 79304, should write at once to J. Crouch & Son, Lafayette, Indiana. Read their advertisement.

Read the advertisement of the Edgewood Farm, West Branch, Iowa. He has a black 2,300-pound stallion for sale.

A number of good big first class young Percherons and big black jacks are advertised in this issue by Fisher & Walker, Evansville, Indiana.

Percheron stallions, the large, drafty kind that the farmers like, are advertised for sale by Singmaster & Walker, Union Stock Yards, South Omaha, Nebraska. They will sell them on terms to suit the purchaser.

W. E. Carter, Batavia, Iowa, has a fine imported bay stallion, that he will sell for $650, or will trade for a large jack. See his advertisement.

O. L. Thisler & Sons, of Chapman, Kansas, has a fine bunch of registered Percheron stallion colts, a few large, Mammoth jacks, and two car loads of mules advertised for sale in this issue.

Percherons, Belgians and German Coach stallions and mares of all ages can be found at the farm of A. R. Ives, Delavan, Wisconsin. His prices are reasonable, and terms to suit.

Crandall & Danforth, of Randolph, Minnesota, still have a good supply of Maple Point Percherons on hand. If interested, write to them.

Dr. W. E. Cheatham, Excelsior Springs, Missouri, has a fine stallion advertised in this issue, that will stand for the season of 1912 at $25. Read his advertisement in this issue.

Write to Watson, Woods Bros. & Kelly Co., of Lincoln, Nebraska, for their big illustrated catalog of Percheron, Belgian and Shires. They guarantee satisfaction.

E. P. Hamilton & Sons, Garden Grove, Iowa, has Percheron, English Shire and road stallions, also mares and colts of all three breeds advertised at "farmers' prices," in this issue.

Registered Percheron mares, blacks and grays, are advertised for sale by H. J. Winget, Trivoli, Illinois.

Royal Belgian draft stallions and mares, at reasonable prices, are advertised in this issue by Blue Valley Stock Farm, Blue Mound, Kansas.

Isaac C. Lohman, Turney, Missouri, has on hand an outstanding lot of good stock. One saddler, two registered Percherons, and a number of good Mammoth jacks. Read his advertisement.

David Cooper & Son, Freeport, Kansas, has a new importation of Royal Belgians, with plenty of size and quality, from the best known strains, advertised in this issue.

George Hirschman, Pierson, Iowa, has some excellent Percheron stallions and a number of good registered mares for sale. Read his advertisement.

John Leitch & Sons, Lafayette, Indiana, has on hand a great collection of Clydesdale stallions. He also has the best five Clydesdale stallions in the Iowa State Fair. Read their advertisement.

Dr. W. H. Richards, Emporia, Kansas, importer of Belgians and Percherons, has a fine lot on hand which he selected personally. Every horse absolutely guaranteed. Write him for catalog.

J. Crouch & Son, the importers of Percheron, Belgian and Hackney horses, have long been distinguished for the superior quality of the horses they handle. They regularly exhibit a strong line of show horses of the breeds they import, and few firms can show an equal record of winnings. An example of their kind of stock can be found in the sensational Percheron stallion, Imprecation (79214) 79304, imported by them last year, and shown successfully against the hardest competition in this country. This stallion, which they announce is the only stallion in America that has been subsidized for use by the French government, is being stood at a fee of $100 to insure mare in foal, the terms in full appearing in their advertisement on page 2 of this issue. This is important in itself, but we speak of it more because it illustrates the character of stallions and mares handled by Messrs. Crouch & Son. They have from 100 to 200 head on hand at all times. The picture and pedigree of Imprecation will be sent free to any one who writes for it (mentioning the American Breeder), to J. Crouch & Son, Lafayette, Ind.

Royal Belgian Draft Stallions

New Importation of Belgians

Forty head of stallions and mares arrived at Fairfax, April 18th. Come and select where the supply is never allowed to run low. Competition in prices and quality defied.
Fairfax is 8 miles west of Cedar Rapids on the C. M. & St. Paul, and on the main line of the C. & N. W. Cedar Rapids and Iowa City Interurban line passes near farm, cars every hour. Phone from Cedar Rapids or Iowa City for team to meet you at car.
HENRY LEFEBURE, FAIRFAX, LINN COUNTY, IOWA.

Dr. W. H. Richards
IMPORTER OF
Belgians and Percherons
A fine importation arrived Sept. 10, 1911. I have selected them personally, and have the pick of Belgium and France's 2 and 3-year-olds. All were selected for good breeding, soundness, bone and individuality. All good colors and will make ton horses. Every horse absolutely guaranteed. Any one looking for a first class STALLION at very REASONABLE price should come and see them before buying. Barns four blocks from Santa Fe depot, Emporia, Lyon Co., Kas.

IMPORTED STALLIONS

PERCHERON, BELGIAN, OR GERMAN COACH

A large selection of the above named breed of excellent quality, at reasonable prices. Every horse leaving our barn is backed by a fair and square guarantee. Our twenty-seven years of continuous importing high-class stallions with a resident buyer in Europe enables us to meet all competition. If in the market for a stallion, write us. We can use bankable paper.

OLTMANNS BROS.

Box 87 - - - Watseka, Ill.

Leer, Germany; Nevada, Missouri; North Fort Worth, Texas

LESS THAN HALF PRICE TO CLOSE OUT.

Gamaleon (3) 2:25-2, sire of 27 in the list; son of Gambetta Wilks. Dam Lady Pepper, dam of nine in the list, daughter of Onward.

Imported Shire, prize winner at the Royal Horse Show at Kansas City; 1,800 pounds and as big and good boned one as you ever saw; coming 8, perfect in conformation and disposition; sound as a dollar.

A 14½-hand jack; light points. Not large, but a good boned fellow, that breeds large; 9 years old.

Yearling registered Percheron stud colt; black with small star, weighs around 1,000 lbs.; dam weighs 1,950 lbs.; sire weighs 2,000 lbs.

$1,000 will buy the bunch; no time for trifling letter writers. I want to close out and money is what I want. This stock will pay for itself twice in the next 90 days; I am busy manufacturing and selling the Gunn Guider Road Builder, advertised on another page of this paper, and must sell this stock.

D. B. GUNN, Red Oak, Montgomery County, Iowa.

RHEA BROS.

PERCHERONS

We exhibited fourteen Percherons at the late Nebraska State Fair and won 17 prizes, as follows: One silver medal, one championship, seven firsts, two seconds, three thirds and three fourths. Now, remember that we showed our home bred horses in the same classes with the imported stallions and won First every time, bar one. So much for the show. The important thing to be considered is "how does the whole lot show up?" and that is exactly where we are strong. Our two-year-olds, some of them still in the pasture, weigh from 1,600 pounds to 1,900 pounds. These weights guaranteed.

We always claimed to have the big boned kind, and this season we are sure we have better bone than ever, cleaner joints and better feet.

Don't lose sight of how we raise these colts, in the pastures winter and summer, until coming three-year-olds. That's why they are hardy and prove breeders from the start.

Our horses are acclimated, its importance cannot be over estimated. We have stallions coming two, three, four and a few older ones for sale at prices that are very reasonable. Every stallion sold under a full guarantee; can furnish life insurance for two-thirds value at cost.

Write for pictures, descriptions, prices and any information you may want.

Arlington is on the main line of the C. & N. W. R.R.
28 miles northwest of Omaha, 8 miles east of Fremont and 55 miles north of Lincoln. Twelve passenger trains daily

Arlington, Nebr.

BREEDING ESTABLISHMENT FOR SALE.

One bay Percheron, registered in the Percheron Society of America; coming 5 years old this spring.

One black Percheron, coming 3 years old this spring, registered in the Percheron Society of America.

Four of the best jacks in the state, and one brown French Coach, 10 years old this spring, grade.

Will sell barns and everything. Best of improvements; in fact, best in state. Will let books go in sale. This year can get 500 mares. Plenty of fine water. Wll take part cash and balance in good notes.

A. G. BUSH, Fairland, Ottawa County, Oklahoma.

STALLION SERVICE RECORD BOOK

Every Stallion or Jack owner Should have this record book, because it is accurate. It is a handy pocket size, with a Waterproof cover, printed on best of paper.

It has a calendar, also a gestation table. It has an index of ten pages, so that each mare can be found easily It has room to give a complete record of each mare. 100 mares can be recorded, each mare having a whole page. The blank at the bottom of each mare's page, when properly filled out and signed gives you a promissory note that is legal and binding.

If you ever use one of these records you will want more of them, just as thousands of others are doing. It has no worthless advertisements in it. It is the latest Stallion Record Book on the market. If you are not satisfied with it, return it, and get your money, which will be cheerfully and promptly refunded to you.

PRICE: 50c EACH, OR 6 BOOKS FOR $2.00

TIM, PRIZE WINNING SHORTHORN STEER, SHOWN BY THE KANSAS AGRICULTURAL COLLEGE.

CLIFTON, PRIZE WINNING HEREFORD STEER, SHOWN BY THE IDAHO AGRICULTURAL COLLEGE.

[SAM] PRIZE WINNING GALLOWAY STEER, SHOWN BY THE MISSOURI AGRICULTURAL COLLEGE.

IDEAL, PRIZE WINNING ANGUS STEER, SHOWN BY THE KANSAS AGRICULTURAL COLLEGE.

AN IMPORTANT SERVICE TO THE BEEF BREEDS OF CATTLE HAS BEEN RENDERED BY THE AGRICULTURAL COLLEGES OF THIS COUNTRY, IN THEIR WORK OF EXHIBITING PURE-BRED STEERS. NO OTHER EXHIBITS OF OUR FAIRS AND LIVE STOCK SHOWS HAVE SO EFFECTIVELY DEMONSTRATED TO THOSE WHO MOST NEED THE INFORMATION, THE REAL, PRACTICAL VALUE OF PURE BLOOD, IN BEEF PRODUCTION

Graham Publishing Company, Inc., 225 West Twelfth St., Kansas City, Missouri

Imprecation

The sensational prize winning Percheron stallion, IMPRECATION (79214) 79304, imported by us in 1911. Gray horse, foaled April 24, 1908. Weight 2,200 pounds.

First prize winner, three-year-old class, and grand champion stallion at the International Live Stock Show, Chicago, 1911, and the ONLY HORSE IN AMERICA HAVING THE DISTINCTION OF BEING SUBSIDIZED BY THE FRENCH GOVERNMENT for use in France.

As a large number of breeders of pure blood Percheron horses are desirous of breeding to this great horse, we have decided to accept a limited number of approved mares for the season of 1912, at our farm, Lafayette, Ind.

TERMS.

$100, cash at time of service, to insure mare in foal. Should mare fail to prove in foal, she may be returned free, or breeder may substitute another mare free of charge; and if horse should be sold, or not in our possession at the time mare is returned, money will be refunded.

Mares sent here will be carefully cared for on pasture, free of charge, and if fed grain, reasonable charges will be made. We will not be responsible for accidents.

All who want to take advantage of the opportunity to breed to the "GREAT CHAMPION" should write us at once. Picture and breeding of IMPRECATION sent on request.

We have 100 to 200 head Percheron, Belgian, German Coach and Hackney stallions and mares always on hand.

J. Crouch & Son, Lafayette Stock Farm, Lafayette, Indiana.

Imported Percheron Stallions

AT REASONABLE PRICES.

We have a large number of imported Percheron stallions and mares brought over last August, and will price them to you on **LOW MARGIN OF PROFIT.** We have cards, post cards, made of our animals and send them out on request. We also have newspaper folders of the entire shipment and would be pleased to have you ask for them if you feel interested. We are **FARMERS, BREEDERS** and **IMPORTERS** and will accord you fair and gentlemanly treatment if you deem it to your interest to give us a call.

J. O. SINGMASTER & SON

Keota, Keokuk County, Iowa.

Highland View Stock Farm.

100 Percheron Stallions and Mares

Came in our last importation. Prices are right, terms to suit. Write or come to see us and learn our method of doing business.

O. N. WILSON, Proprietor, - Kittanning, Penn.

PLEASANT VIEW PERCHERON STOCK FARM

I have for sale a choice lot of imported and home-raised Percheron stallions and mares. A number of them are sired by the famous horse Barnum, that was champion at the International in 1904. Prices reasonable. Come and see them and I will save you money. Marcus is located 44 miles northeast of Sioux City on the I. C. R. R., in Cherokee County.

Chas. P. Quirin, Marcus, Iowa.

Truman's Champion Stud

We received ANOTHER IMPORTATION of high class stallions on April 10th, which makes us MORE STRICTLY HIGH CLASS IMPORTED SHIRE, PERCHERON AND HACKNEY STALLIONS for sale than can be found in any other establishment.

Truman's Are Never Sold Out

Special Prices For Thirty Days

Truman's Pioneer Stud Farm

Bushnell, Illinois

Cash or Credit

Will Buy Them

The real value of our Stallions is not expressed by price. We have exalted the "SQUARE DEAL" and proved the profit that lies therein.

Everybody loves a bargain and we have them.

Buy Now,

Comparison sells more of our Stallions than anything else. Do you realize that our guaranty on a Stallion stands for honesty, the only safe policy. (Our service book, 10c.)

GEO. W. SOUERS & SONS

601 to 949 West Matilda Street

HUNTINGTON INDIANA

TAYLOR & JONES

STALLIONS

Stallion buyers, why do Taylor & Jones sell more horses than almost any of their competitors? If you will stop to think, you will certainly know their horses must be better, their prices lower and their guarantee as good as can be written, as every man wants the best value for his money. We can please any customer in either Percherons, Shires or Belgians.

Our first importation in 1912 has just arrived at our barns and in the lot are many high class stallions, and as there has been no great expense on them as yet in the way of feed, care, risk, etc., we can sell them worth the money. If you are looking for a good horse, come and see us.

Taylor & Jones,

Williamsville, Sangamon County, Illinois

Improving Young Before Birth

Influence of Nutrition, Age and Size of Parents on Number, Size and Vitality of Offspring. Their Importance to the Breeder of Live Stock.

Written for The American Breeder,
By Prof. E. N. Wentworth, Animal Husbandry Department, Iowa State College.

THE Iowa experiment station, in work conducted by Prof. John M. Evvard last year, discovered a difference of almost two pigs per litter between their most rapidly and least rapidly gaining sows at time of breeding. The best gaining sow in each of seven lots averaged nine pigs. the least gaining produced 7.2 pigs, and the ratio between daily increase in weight at conception and size of litter was maintained throughout the experiment.

The more carefully one will investigate the possibilities of influencing the heredity of animals by external means, the more thoroughly will he become convinced that such a method is impossible. Therefore such external factors as are controllable from the standpoint of giving the animal a better start in life are of importance to the careful breeder.

Influence of Nutrition of Parents.

In the preceding statement reference was made to one effect of nutrition on the size of litter in swine. The writer, in pursuance of work for his master's degree, studied the influence of protein in ration on the litter, and discovered little difference in the weight at birth of pigs whose mothers were given different feeds, but did find a marked difference in the rate of gain. The pigs that had received the most protein through the mother gained much more rapidly, particularly after weaning, had a lower percentage of mortality and were much more vigorous and hearty. These investigations have been carried on in a much more extensive manner at the Iowa station in the last two years, and the weight at birth and quantity of protein up toan economic point have been found to correspond absolutely. The belief that these results obtained in sheep has led shepherds for a number of years to adopt a "flushing" system, so that it is interesting to consider the application of this principle to cattle.

The writer is not aware of any absolute investigations in this connection with beef animals but has access to some calving records with reference to severe seasons that throw some light on the matter. For a period of five years the average weight at birth of the calves in a Shorthorn herd were 109 pounds, 76 pounds, 94 pounds, 98 pounds, and so far this spring, 71 pounds. For an Angus herd the following records are obtainable: Seventy-three pounds, 66 pounds, 81 pounds, 83 pounds, and so far this spring 62 pounds. In both cases feed was scarce during the second year of the record and in the present season as well. This gives an idea of what scant conditions may produce but does not show the value of higher nutrition. To answer this question an example may be drawn from a friend of the writer who was a breeder of Shorthorns and had planned to hold a fall sale that was of necessity postponed until the following spring. He started fitting his animals for it in July, and had them all gaining in nice shape when he bred eight heifers and six mature cows to sell in calf to his herd bull. The forced postponement of the sale caused him to put up all but one heifer, with calf at foot. In response to a request he recorded the birth weights of these thirteen calves as well as those of the rest of his herd during the spring. The seven heifers produced 75-pound calves on the average, as against 69-pound for the rest of the heifers of the herd, while the six cows produced 102-pound calves to compare with 91-pound animals for the remainder of the mature breeding females. In each case thus far considered superior nutrition has been found to increase the weight of the offspring.

There yet remains a comparison of animals in show condition and those that are in ordinary breeding shape. Birth weights were unobtainable on this class of animals, but the weight at 2 months old of 36 calves from the breeding herd and seven calves from show animals, gave a slight advantage to the average of the 36. It is possible that the extreme fat of the mothers would interfere with the development of the foetus, but it is also possible that the greater numbers from the breeding cows and lesser numbers from the show animals may have affected the average to a marked degree.

As a general conclusion it is safe to say that few beef breeders are likely to have their cows in too high flesh to secure satisfacory offspring, while careful attention to the needs of the animal at breeding time and during pregnancy will give valued returns in size, vigor and maturity.

Influence of Vigor in the Parents.

Vigor is a difficult term to define accurately and satisfactorily, not that it is an elusive thing, difficult of detection and description, but rather because it is so indefinite and difficult of accurate gradation. What is considered a fairly vigorous animal by one man may be lacking in vigor with another. Girou in France divided 300 ewes into two lots; the first well fed and served by yearling rams, the second deprived and served by 2-year-olds. He notes that the lambs from the first lot were from one-half to one pound larger on the average and much more sturdy. This may be quoted as evidenee of the effect of nutrition as well as of vigor, but it calls attention to one point which breeders are apt to overlook. Most men pay attention to vigor in the male and neglect the female, while the above results would show that vigor in the female is fully as essential, if not more so than in the male. The well fed ewes would reasonably be the more vigorous of the two lots, and the older rams possessed of more breeding stamina than the immature yearlings. Consequently the heavier lambs from the vigorous ewes would show the marked importance of vigor in the female.

Inasmuch as the determination of vigor is so difficult, experimental work on the subject is almost impossible. A pure bred Shorthorn bull used in one herd in his 2, 3 and 4-year-old ages gives some interesting adta as he grew into vigor with maturity. The first year he settled 64 per cent of the females in the herd; the second year 81 per cent, and the third year 86 per cent. The first year his calves at 2 months averaged 212 pounds; the second year 238 pounds, and the third year 246 pounds. Since (with a few exceptions due to failure to get some of the females in calf) the breeding herd was the same for three years, and since there was no marked difference in the care of the young in the successive years, the differences were probably due to the vigor added with yearly growth.

The relations between the age of parents and offspring has been pretty

A MOTHER AND DAUGHTER IN WHICH ARE EXEMPLIFIED THE RESULTS OF AN INTELLIGENT GENERATION-AFTER-GENERATION OBSERVANCE OF THE KNOWN AND PRACTICAL MEANS BY WHICH "OFFSPRING" ARE IMPROVED BOTH BEFORE AND AFTER BIRTH.

thoroughly investigated by insurance companies in connection with human beings, and some of their conclusions should prove of practical importance with cattle. These conclusions will simply be listed without comment that the reader may apply them to a degree suitable to himself.

The older children of a parentage live sensibly longer than the younger children.

There is an indirect relation between the age of relatives at the time of death or their present age, and the expectation of life in the offspring under consideration.

To these may be added some conclusions drawn from sheep at the University of Wisconsin. .

The rate of production for ewes from their second to the sixth year rose from 141 per cent to 191 per cent. This, of course, only aplies while the animals are still in possession of their breeding powers.

A male is best at sexual maturity, and is without bisexual leaning. (Supported by scientific investigation).

The writer in a recently published article ("The Age Factor in Register of Merit Jerseys," American Breeders' Magazine, 1911, vol 2, No. 2, page 97), investigated age in Jersey sires with reference to the performance of their daughters in the register of merit (a record of milk and fat production above certain arbitrary standards). If the perfect relation between the age of sire and production of cow (viz., increase in production balancing increase in age) be represented by 1000 and compared to the condition actually found, the figure determined in the paper would be 0.6647. In other words the relation between age in sire and production in daughter is about two-thirds of being absolutely perfect. It is easy to see that since 46.8 per cent of the cows in the register are sired by bulls under 3 years of age the proportional increase in production equivalent to the 12-year age would rejuire something far beyond the limits of milk and butter fat of any animal. In general we may say added maturity gives slightly increased productive powers.

Mr. C. L. Redfield of Chicago has advanced some rather convincing statistics in regard to the relation of age between generations and functional powers, such as racing speed, milk production, etc., in animals. While Mr. Redfield's figures have not been disputed his inferences from them have, and as a result the writer will only briefly mention the theory he advanccs. He believes that age results in a greater proportional storage of energy, and consequently traces a direct relation between age and production. In beef animals for example he assumes that the tendency to produce fine beef in the offspring will be transmitted at the age in which the best beef is produced in the steer, namely 24-36 months. This is difficult to prove experimentally or substantiate. It is about as easy to obtain reverse results from a study of international grand champions.

From some of the old college records the writer has worked out the following: Six heifers between 24 and 36 months produced 68-pound calves; between 36 and 48 months, 82-pound calves, and between 48 and 60 months 88-pound calves. Thirteen cows produced 76-pound calves between 36 and 48 months, while their next calves averaged 86 pounds. As a general observation the calves were more vigorous and grew more rapidly from the animals as they became older, but no figures are at hand.

While nutrition has supplied perhaps the strongest evidence so far to convince one of its influence as an external force capable of affecting offspring, yet it is closely rivaled by the factors of size in the parent.

In reference to weight some differences are observed from the rank as to frame, for from figures available Herefords almost equal Shorthorns on the scales, while the Holsteins fall be-

(Continued on page 11.)

Scrub Bulls an Extravagance

Conditions Which Made Scrubs Possible Have Passed. Where Wider Use of Purebreds Would Have Added $86,000,000 to Cattle Values in Texas. Some Figures in Detail.

Written for The American Breeder,
By John C. Burns, Professor of Animal Husbandry, A. & M. College of Texas.

CHEAP lands and cheap grass have long been the most important factors in the economical production of beef. They have been indispensable to the slipshod, easy methods that have been, and are yet, too commonly in vogue in carrying on the business of beef making.

The cutting up of the heretofore large grazing areas of the country into small areas of pastures and farms, due to the rapidly increasing population and the consequent increase in the value of lands, make the raising of highly improved cattle most important. When land and grass were cheap scrub and low grade cattle yielded a fair profit, though good cattle would have paid considerably better. Now, with high priced lands, high priced grass and other feedstuffs cattle must be of the well improved kind in order to be profitable. The land must support animals of greater value if it is to pay good interest on the investment. The sooner it is realized by those who have not already done so, that cheap land and cheap grass are almost altogether things of the past, and that with these things belong all methods but the best, the sooner can beef production be accomplished most economically.

Beef cattle that command the highest prices are those that come nearest to meeting the butcher's ideal, and the further removed they are from the ideal type of the butcher the lower the price they may be expected to bring. The scrub is representative of just the opposite of the desired type, both as to the economical utilization of feed and as to the requirements of the market. The breeds of beef cattle, on the other hand, have been developed through careful selection and breeding by man to better meet his requirements. Hence, the good pure bred embodies the qualifications of making, with proper care and feeding, the most economical gains and of being what the butcher demands when finished. It is the nearest approach to the type of the good pure bred that the farmer and ranchman must strive to produce, whether they are breeding and finishing their cattle for market themselves, or only breeding them to sell as feeders for somebody else to finish, if they are to derive the greatest profit from the business. When we consider the vast number of cattle in the United States used entirely for breef production that fall far below this standard, and consider the great advantage that the good kind have over them, we must realize the great importance of improvement.

How can improvement be brought about in the most economical way?

The one great and only practical means is by the continuous and systematic use of only good pure bred bulls of the beef breeds. The time has come when every farmer and ranchman should realize that he can no longer afford to use scrub, grade and cross-bred bulls in his efforts to raise beef cattle. With numerous outstanding examples of what can be accomplished with good, pure bred bulls, one may well wonder why any other kinds are tolerated.

Let us make a few comparisons as to the average value per head of the beef cattle of different states. According to the Year Book of the United States Department of Agriculture Jan. 1, 1910, Montana ranked first of the states of the Union, with the average price of $27.40 per head; Wyoming and Illinois second, each with $26.40 per head, and Indiana third with $24.50 per head; Mississippi ranked last with $8.40 per head; Alabama and Arkansas next to last, each with $9 per head, and Georgia third from last with $10.30 per head. While the wide difference in the average value per head between the highest ranking states and the lowest ranking state may be attributed partly to conditions of environment, by far the greater part of it is due to breeding—improved blood on the one hand and the lack of it on the other. By the use of good pure bred bulls of the beef breeds in a grading-up process, the cattle of the low ranking states can be made, in a comparatively short period of time, to equal in value those of the high ranking states, and even greatly to exceed their value as given in 1910, for the latter states have by no means reached the limit of what can be accomplished by this method of improvement.

The state of Texas is reported as having had within its boundaries Jan. 1, 1910, 7,131,000 head of beef cattle—about twice as many as contained by the state ranking second in point of numbers. The average price of these cattle is given as $15.30 per head, making their total value $109,104,000. Comparing the value of Texas cattle with that of Montana cattle, we find a difference of $12.10 per head. Hence, if Texas cattle were equal in average value per head to Montana cattle it would mean an additional sum of $86,285,100 to Texas cattle owners. This partly represents what a more extensive use of good pure bred beef bulls can accomplish for Texas.

Nothing emphasizes the superiority of well bred cattle over scrubs so much as does the difference in the prices they command on the market. Using conditions in Texas as an example, let us compare the prices received for stockers and feeders of the "cold blooded," inferior sort, with the prices received for those that approach nearest the ideal beef type as a result of grading. On account of their great lack of early maturing qualities there are practically no common and inferior steers under 3 years old that are used as feeders. As a rule those that change hands up to this age are used as stockers. The prices ordinarily received for steers of this character are about as follows:

> Spring and early summer calves sold in the fall, $7 to $8 per head; yearlings, $10 to $13 per head; 2-year-olds, $15 to $18 per head; and 3-year-olds and over $20 to $25 per head.

There are ranchmen and farmers in Texas who have used only pure bred beef bulls for several years, and now uniformity and the type that is most in demand by the market characterize their herds. Such cattle possess early finishing qualities and other qualifications that make them highly adapted to the feedlot at an early age, when gains are made most economically. Most of them are, therefore, fed out and ready for the butcher's block before they are 3 years old. So we find that highly improved calves and yearlings are sold as either stockers or feeders, while there are few 2-year-olds but what are sold as feeders. The prices that steers of this character are bringing are about as follows:

> Spring and early summer calves, sold in the fall, $17.50 to $20 per head; yearlings, $25.50 to $30 per head, and 2-year-olds, $32 to $40 per head.

Thus it is seen that the prices for the highly improved kind are more than double those of the unimproved. When the two kinds are finished for the market the highly improved steers not only sell for a much better price per pound on account of their superior conformation and quality, but they weigh much heavier at the same age.

Some farmers and ranchmen use scrub and grade bulls in their herds because of the higher cost of pure bred bulls, not realizing that the latter are by far the cheapest in the end. With the scrub no improvement is made. With the grade, progress is slow and results are indefinite and lack uniformity. Though the grade bull may possess the individuality of a good pure bred, he generally lacks the prepotency necessary to a good breeder.

Placing the cost of a scrub or grade bull at $25 to $50 and that of a pure bred, suited for grading, at $150 to $200, the extra cost of the latter is from $100 to $175. Now let us consider this problem: One may begin with a herd of "cold blooded" scrub females. He will use only pure bred bulls of a particular beef breed and will breed the females of each generation to drop calves at 3 years old. At the end of thirteen years will appear the offspring of the fifth cross, possessing 96⅞ per cent of pure blood; and at the end of sixteen years the offspring of the sixth cross, possessing 98 $\frac{7}{16}$ per cent of pure blood. From the butcher's point of view cattle of these grades are practically equal in merit to pure breds. For reasons already stated, however, the grade males should not be retained for breeding purposes if improvement is to continue. Only pure bred males which possess the individuality and breeding that will insure further improvement should ever be used. Now, referring again to prices received for highly graded cattle, as compared with scrubs, the difference in the prices of calves is from $9.50 to $13 per head. This means that for each cross of pure bred bulls, at least to the fifth or sixth generation, there is an average increase of over $2 in the value of each offspring. Improvement, however, is much more rapid from the earlier crosses than from the later ones, and hence for each of the former the increase in the value of each offspring is considerably above this average. It is a common practice to allow one bull to about forty cows, and ordinarily from this number there will be about thirty-five calves. The increase in value of $2 per head on this number returns $70 on the pure bred bull. Two crops of calves, therefore, practically covers the extra cost of the pure bred bull, which is now worth probably more than when first placed in service.

Inbreeding should, of course, be avoided, and this necessitates obtaining new bulls for each succeeding generation of females, which may be done by exchange or by direct purchase.

Can farmers and ranchmen afford to use pure bred beef bulls? The evidence certainly indicates that they can not afford to use any other kind. Let it be remembered, however, that with improved cattle there must be improved environment. It is only when improved live stock are subjected to the proper conditions and care to develop fully the possibilities within them that they give their best returns.

Those who want to get a line on who or what the women will support in case they secure equal suffrage, will find it in the following from the Jewell (Kas.), Republican: "Madam, are you a woman suffragist?" "No, sir, I haven't time to be." "Haven't time! Well, if you had the privilege of voting, whom would you support?" "The same man I've supported for ten years." "And who is that?" "My husband."

Summer Fattening of Beef Cattle

Grass a Double Aid in Improving Quality of Flesh and Promoting Thrift of Animal. Concentrated Feeds That Worked With it Best in Five Years of Experiments.

Written for The American Breeder,
By Prof. F. B. Mumford, Dean of the College of Agriculture, University of Missouri.

IT is entirely correct to say that the choisest cattle reaching the fat cattle markets of the Middle West are those which have been fed for a longer or shorter period upon grass pastures. No type of winter feeding can give the finish, quality and marketable condition that can be secured from the fattening of cattle on pastures. In fattening cattle by this method many risks are avoided. The cattle are maintained under more normal conditions. Disease, digestive difficulties and danger from communicable diseases are all minimized when cattle are turned to grass in the spring.

The ordinary cattle feeder has two purposes in view in fattening cattle. He desires to improve the condition of the cattle in respect to fatness and to secure an increase of body weight. It sometimes happens that the largest profit from cattle feeding operations comes from the improvement made in the marketable condition of the animal and not from the direct increase in live weight. If this is true it must also follow that the wider the difference between the condition of the animals at the beginning of the fattening period and at the end of same, the greater profit will be secured from this source. The terms fattening and finishing are frequently used in connection with cattle feeding operations and are understood to refer to the changes which take place in the condition of animals which result in the accumulation of fat in the body of the animal. Different degrees of fatness are indicated on the market by such terms as prime, choice, good, medium and common, or rough steers. These terms refer primarily to differences in condition, but also involve to some extent the quality of the animals in question. Unfortunately there are no accurate terms which can be used to designate the varying degrees of fatness or condition in fat cattle. When cattle are fed for a certain length of time on a concentrated ration of grain with proper roughage or grass they reach a condition when they are said to be finished or ripe, or fattened, or prime. When an animal has reached this period in its development in fat tissue, it is not able longer to use feed and improve in respect to those qualities which are desirable in fattened animals. It is seldom or never profitable to feed animals after they have reached this finished condition. It is, of course, true that the great bulk of cattle that pass through the fat cattle markets are sold long before they have reached this condition or ripeness, which entitles them to the designation of finished cattle.

Condition Important in Summer Feeding.

From an exhaustive investigation conducted at the Missouri Experiment Station for a number of years, it has been definitely established that one of the chief and important factors in the selection of cattle for summer feeding is the condition of the animal at the beginning of the feeding test. It seems to be definitely established that the thinner the animal at the beginning of the feeding experiment the more certain the animal is to make profitable gains. In Table 1 I have given the results from 5 years' feeding at the Missouri Experiment Station on various rations. This table is interesting from more than one point of view, but particular attention at this point is called to the three lots of cattle fed in 1907 as compared with the cattle fed during the other four years of the same rations. It will be observed that the results for 1907 show a materially larger grain requirement for one pound of gain than for the other years. The explanation of this variation is to be found in the fact that the yearlings fed in 1907 had already been on full feed six months when they were turned to grass on the first day of May. They were therefore in much higher condition when turned to grass than were the cattle of any previous year.

In a number of investigations with cattle that had been fed on different wintering rations at this station which resulted in the production of very different gains, it has been found that in every case the cattle that make the smallest gains in the winter are those that make the best and cheapest gains in summer. This is particularly true in the case of cattle that are not given any grain while grazing. So clear are our investigations on this point that I have no hesitation in saying that cattle that are intended for grazing should never receive a generous ration during the winter time. If cattle are given a good, strong ration in the winter time they should be continued on a similar ration when they are turned to grass.

STEERS FATTENED AT THE MISSOURI AGRICULTURAL COLLEGE FARM, THAT WERE AFTERWARDS PRIZE WINNERS AT "INTERNATIONAL."

The Best Rations For Beef Cattle on Grass.

Every feeder who is finishing cattle on grass is concerned with the question, "will it pay to supplement a ration of corn with some nitrogenous supplement like cottonseed meal or linseed meal?" Both these supplements have given such satisfactory results in winter feeding that feeders believe and expect similar results will come from adding these materials to a grain ration when cattle are fattened on grass. Attention is again called to Table 1 in which for a period of five years yearling cattle were fed on different rations as indicated in the table. I think a careful study of this table will suggest that with yearling cattle full fed on good blue grass pasture, there is very little advantage to be gained in feeding nitrogenous supplements to corn. Ordinarily we should certainly expect a smaller grain requirement when cottonseed meal or linseed meal is added to corn than when an exclusive corn ration is fed. From this table, however, giving the results with yearling cattle extending over five years there is little or no advantage shown in this regard for the supplemented ration.. Cattle receiving a suppplemented ration invariably consume a larger amount of grain daily per 1,000 pounds live weight. The supplemented ration is more palatable and the gains made from the mixed rations are always larger in a long feeding experiment than from a ration of corn alone. The probable explanation of the efficiency of corn alone fed to cattle on blue grass pasture as compared with the supplemented rations is that the corn lots may eat larger quantities of grass. It is, of course, impossible to measure this factor We have also found that the supplemented rations are more efficient during the later stages of the feeding period. The animals do not get off feed so easily and are in somewhat better health than those fed corn alone, but from an economic point of view and with the usual relation existing between the price of corn and of linseed meal and cottonseed meal it has not been found profitable at this station to feed cottonseed and linseed meal with corn for the entire summer feeding period.

TABLE 1.

Grain Required to Make One Pound of Grain—Five Years' Results With Yearling Cattle Fattened on Blue Grass.

One hundred and twenty cattle divided into twenty lots.

Year	Ration	Lots fed corn alone	Lots fed corn and linseed oil meal	Lots fed corn and cotton-seed meal	Lots fed corn 5 months,corn and linseed oil meal 2 months
		Lot. 4	Lot 1	Lot 2	
	Corn.	7.36 lbs.	5.57 lbs.	5.31 lbs.	
1903	Supplement.		1.86 lbs.	1.77 lbs.	
	Total.	7.36 lbs.	7.43 lbs.	7.08 lbs.	
		Lot 25	Lot 22	Lot 23	
	Corn.	7.45 lbs.	6.56 lbs.	6.37 lbs.	
1904	Supplement.		1.27 lbs.	1.40 lbs.	
	Total.	7.45 lbs.	7.83 lbs.	7.77 lbs.	
		Lot 46	Lot 43	Lot 44	
	Corn.	7.26 lbs.	5.74 lbs.	6.08 lbs.	
1905	Supplement.		1.32 lbs.	1.40 lbs.	
	Total.	7.26 lbs.	7.06 lbs.	7.48 lbs.	
		Lot 71	Lot 73	Lot 72	Lot 70
	Corn.	7.40 lbs.	6.06 lbs.	6.31 lbs.	6.80 lbs.
1906	Supplement.		.89 lbs.	.94 lbs.	.29 lbs.
	Total.	7.40 lbs.	6.95 lbs.	7.25 lbs.	7.09 lbs
		Lot 96	Not 94 and 95	Lot 97

Proportion of Supplement to Feed.

Market conditions sometimes exist in which corn is relatively higher than cottonseed or linseed meal. When such conditions do exist it may sometimes be profitable to feed these materials throughout the feeding period. When this is the case the proportion of supplement is a matter of importance As a result of many experiments with a half dozen different proportions of corn and supplements we have fixed upon the proportion of six parts of corn to one part of linseed meal at this experiment station. A larger proportion of supplement than this fed to cattle on grass does not bring proportionately larger returns, and when a less amount of supplement is fed maximum gains cannot be expected.

After all the successful cattle feeder must not disregard any of the factors involved in profitable cattle feeding. The kind of cattle to feed, the best ration for maximum gains, even the condition of the cattle are all relatively small in importance as compared with the margin between the buying and the selling price. The feeder can make a profit if the margin between the price paid per feeder and that received for finished cattle is sufficiently wide. Otherwise the most expert feeder having at his command all the knowledge now available might be an economic failure as a cattle feeder. Unfortunately we have not yet reached the time when the cattle markets are so stable and when the feeder can count on receiving for fat cattle any definite increase over the price paid for the feeders.

It is to be hoped that such stability may be eventually attained and that the feeder may be able to predict with a reasonable degree of assurance that probable margin which he may expect to receive.

The tenderloin muscle is a good indication of the amount of lean in a carcass.

The day is not far distant when we will cease to import potash.—From the 1911 report of the United States Secretary of Agriculture.

QUESTIONS
AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

WARTS—What treatment would you recommend for warts which often come about the eyes, and muzzles of young cattle some time during the summer. We sometimes have a few short, yearlings or 2-year-olds which get quite bad with this trouble. A few warts do not seem to bother, but sometimes they get so bad that they appear to cause quite a checking of the animal's growth.—Kansas Subscriber.

REPLY—Where warts are numerous on the bodies of cattle you will find that one of the effective and easily applied agents for their removal is castor oil. A daily application should be made which in the course of a few weeks will effect the removal or the greater portion of them.

INDIGESTION—A mare not with foal, 12 years old, has repeated attacks, and exhibits the following symptoms. To start, she paws with her front feet a little and then carefully lies down and stretches out on her side, legs extended, and head drawn slightly toward her body. Occasionally she extends her upper lip. She may roll a little but not violently, but usually lies down as above described for fifteen minutes at a time, then will get up, paw a bit, look at her flank, and lie down again. Heart and temperature normal. Pulse normal. Bowels in good condition, until after attack, when they are very loose for a day or so. As to treatment, I gave one ounce of baking soda, and one-half ounce of ginger as a drench, with apparently no result. In about two hours I gave two bottles of Harlem oil and in an hour she was up eating. Please diagnose this case, if possible, and advise treatment.—Washington Subscriber.

REPLY—Your mare is undoubtedly affected with an attack of indigestion and we would suggest that you give her a run of grass, discontinuing her from service. If it is found necessary to keep her at work we would advise that you restrict her diet to oats to which a small quantity of bran and ground oil cake has been added. To her feed add one-half ounce of Fowler's Solution. See that the hay is of the best quality.

SEARING NAVEL CORDS—Can you tell me anything about the practice of searing the navel cord of a newly born calf. I understand that it is a common thing with Scotch herdsmen to use a searing iron as the only prevention against infection. If there is some less painful treatment I should like to know, and should also like to know if it is advisable to give every calf some preventative treatment when it is dropped.—Iowa Subscriber.

REPLY—The practice in vogue with Scotch herdsmen of searing the navel cord to prevent navel infection is quite a good one. It not only has the effect of destroying harmful bacteria that may be present, but aids in drying up the parts so as to make less favorable a field for their growth. We have found by experience, however, that a drying dusting powder is far more effective.

ABORTION—I have a mare that has lost her colt two years in succession. Last year, I think the trouble was she got kicked. This year I cannot account for the trouble. Have been working her steady on light work. Would you advise breeding her again, or would you let her run barren this year? She is strong and eats good.—Wyoming Subscriber.

REPLY—It has been a matter of observation that animals that abort are inclined to repeat the action at about the same period on the following year. The habit becomes a fixed one, which is perhaps responsible for the trouble complained of this season. We would advise that you permit her to run over this year.

STRINGHALT—I was on a deal to trade for a jack that has something like stringhalt—he jerks his hind legs when he moves around. I owned one myself some years ago just like this one, but he finally quit, or got well, although I did nothing to help him. Can anything be done to cure or stop this trouble? He is a fine breeder, and I would like to own him if this can be remedied.—Missouri Subscriber.

REPLY—Stringhalt is due to a variety of causes, one of which is rheumatism. If due to rheumatism there is an opportunity that the animal may recover from the difficulty when the rheumatic symptoms subside. We suspect that was the case of the animal that was once owned by you. Many of these cases, however, are due to other causes and nothing short of an operation will effect a cure. The operation consists of severing a certain tendon, whether below or above the hock, which in many cases has given very prompt relief. Some subjects do not respond to this method of treatment and we would suggest that you consult some qualified veterinarian who has made this subject one of particular study and follow his advice in the matter.

HOLLOW HORN—Is there any such disease as hollow horn in cattle? I heard it talked of this spring, but suppose if there is such a disease, there is some other name by which it should be called. The treatment I heard advised did not seem reasonable to me, but if there is any such trouble I would like to learn through The American Breeder how to cure it.—Missouri Subscriber.

REPLY—Properly speaking there is no such disease as "hollow horn" in cattle. It is one of the old fogy ideas that has been handed down from generation to generation, and like loss of cud in cattle and bots in horses, should be forgotten. Do not allow anyone to talk you into the idea of giving needless and cruel treatment to an animal suspected of having trouble of this kind.

HOLLOW HOOF—Please advise me what to do with a horse's hoofs when they become hard, dry and brittle, and break off so short that a shoe cannot be put on. Do you know something that will toughen the hoof and at the same time cause it to grow more rapidly?—Indiana Subscriber.

REPLY—First, apply large poultices to the feet so as to soften them. A poultice consisting of one part of oil cake with an equal amount of bran mixed with warm water will serve the purpose. Make this application for two or three days, changing the solution once daily. At the expiration of this time anoint the hoofs with vaseline to which has been added a little pine tar. This will prevent evaporation of the moisture of the foot and help to keep it soft and pliable. About once a week apply the following just above the hoof line, allowing the application to extend upward about one and one half inches. Pulverized cantharides one half ounce, lard four ounces. Apply this with fingers with friction and permit to remain on for 24 hours, then wash off with warm water and soap and when dry apply a little lard to keep the skin soft. This agent will blister slightly and will induce a more rapid and healthy growth of the hoof.

BLOAT IN CATTLE—Please tell me, through the columns of The American Breeder, if there is some better way to relieve bloating in cattle than by using the trocar that I have seen advised. I would much rather try some other remedy as it seems to me the trocar would be dangerous. However, I should like to know about the use of this instrument, also, and where one can be secured. I believe a great many cattle are being turned into clover and alfalfa earlier than usual this season, and doubtless many of your readers will be as much interested in this information as I am.—Nebraska Subscriber.

REPLY—The trocar is the most effective method of relieving bloat in cattle and when properly used there is practically no danger in its employment. These cases usually require very prompt action and medicine alone does not act promptly enough. It is always well to make use of medicine after the animal is relieved with the instrument, and as to just what should be administered depends on the condition of the case. As a rule purges, antiseptics and stimulants are in order.

GREASE HEEL—I have a 2-year-old colt that had something like grease heel last spring, and now has it again. The hind feet and legs are swollen and are wet of mornings, also tender. What can I do for her? Is it contagious or hereditary?—Illinois Subscriber.

REPLY—Use large, warm antiphlogistine packs until the inflammation and soreness has subsided and follow by dusting the places with calomel and corn starch in equal parts. Be sure that your stalls are clean and sanitary. Be careful and exclude her from mud holes in the pasture.

COLIC—I have a mare six years old. Last spring she had a colt and did all right with it. On the seventh day I bred her, and from that time for about six days she passed a thick yellow passage. The veterinary told me she needed a wash, but I didn't use it. I had to return her three times before she proved to be in foal. Will it be all right to breed her this spring after foaling? She has slight colic spells, but seems to be all right. She will quit eating for a short time and then go back to eating again.—Kentucky Subscriber.

REPLY—Give the mare a run at grass if possible. If at foaling time everything appears to be as well as reported now, you may breed her again.

TUBERCULOSIS—We have a neighbor with a good herd of registered beef cattle, who says that his breed is practically free from tuberculosis. We have been raising grade cattle, but are going to buy some pure bred heifers of some beef breed this spring. We want to start as near right as our means will allow, and if there is any choice as to breeds in this matter, we will appreciate hearing from you on the point.—Illinois Subscriber.

REPLY—We are not in position to say that one particular breed of cattle is more free from tuberculosis than another. We believe this a matter that is governed largely by the way animals are kept. Confinement and warm housing is productive of the disease, especially if the quarters are illy ventilated. It is a matter of observation that those animals that live out of doors a great deal are more hardy and do not have tuberculosis as often as those that are more closely housed. In making a selection we believe we should give careful attention to the manner in which the particular herd we were selecting from was kept unless we had some special choice as to breed.

SORE FROM LYING IN MANURE—I have a very valuable 3-year-old jack that I noticed a few days ago the hair was coming off his flank, and the skin seemed thick and slightly sore. It has extended under his belly to his navel, and on between his fore legs. The skin has become raw in places, and of course he is inclined to gnaw it. There was a place swelled by his navel yesterday about six inches long and four inches wide, but the swelling has mainly disappeared today. It presented the appearance of having been scalded by lying in manure and urine, but I don't think I let sufficient stuff of that character accumulate to cause it. Am feeding bran with oil meal, giving him treatment for his blood, and using antiseptic healing powder. I suppose I got careless and fed too much corn. His grain ration consisted entirely of corn all winter up to the last few days.—Kansas Subscriber.

REPLY—I think you are correct in stating that the injury to the skin is due to the jacks lying on manure, inasmuch as the ammonia that is evolved will cause considerable irritation to the parts exposed. We would suggest that you give particular attention to the sanitation of his stall and apply the following to the parts: Sugar of lead, 1 ounce; water, 1 quart. Shake up this solution and apply three times daily. It would be well to permit the jack to have a run of grass, and by all means discontinue the corn diet.

OUT OF CONDITION—I have a registered Shorthorn cow that is a good milker but seems to have gotten out of condition. A neighbor of mine tells me she has "lost her cud" and I do not remember seeing her chew her cud for several days. Sometimes she swallows and acts like she was trying to bring it up. Several friends have suggested different remedies, but I want some reliable advice before I do anything as some of the treatments suggested do not sound very reasonable to me.—Missouri Subscriber.

REPLY—It is not always easy to tell why a cow should decline in condition without an opportunity of making a personal examination. The mere fact that your cow does not ruminate does not signify that she has "lost her cud." The fact is that the ox is quite inclined to cease to ruminate when affected with almost any disease. One, in searching for the cause of ceased rumination in cattle, should study closely the condition of the digestive, tract, state of the bowels, etc. The general care that has been given the animal in the way of feed, water, and housing, should be reviewed, and above all the presence or absence of tuberculosis should be fully decided in every case that from unexplainable causes show a tendency to decline in flesh. The correction of any of these conditions is wholly dependent on the cause, and a removal of the cause is the very first thing in order.

HOG CHOLERA—We are building up a herd of registered Duroc Jersey hogs and have got several gilts from different breeders in Missouri, Kansas and Oklahoma. We have a very fine boar from an Illinois breeder. Now we read a good deal in the papers about hog cholera in these states and about the serum treatment. I want to know what this treatment is, and if it would be a good plan for me to vaccinate all my hogs. There has been no disease in this locality that I have heard of and it has been two months since I shipped in the last gilt. I should like to read in the American Breeder as much about this matter as you feel you can give space for.—Mississippi Subscriber.

REPLY—We do not believe it advisable for you to incur the expense of vaccinating your hogs against cholera inasmuch as you are in no immediate danger, there being no cholera in your locality.

An explanation of the serum treatment begins with the method by which the serum is produced and consists briefly of taking a hog that is either immune to cholera by having had the disease or has been made immune by certain treatment, and injecting into the hog's system repeated doses of blood from a hog that has the cholera. The result is that there is built up in the hog thus treated a very high resistance to the disease and it has been found that when the serum of the blood of this hyper immune animal is injected into the system of those susceptible to cholera that it has the effect of provoking in them a resistance to the disease. This resistance appears to be only of a temporary character, however, and it seems that hogs thus treated only remain immune for a period of from six weeks to three months. A more permanent immunity may be induced by injecting at the same time or within a few days, a small amount of serum from a hog sick with cholera. When this method is employed, which is known as the "simultaneous method," the immunity is much more lasting and perhaps remains, generally speaking, during the life of the animal. This latter method, however, is not entirely devoid of danger, for the aim is to give such hogs treated, hog cholera in a mild form. The degree of severity of cholera thus induced is not always readily controlled, and when the simultaneous method is used there is always some danger of spreading the disease. Whenever actual sickness is apparent after using the silmutaneous method the owner should lose no time in revaccinating his herd with liberal doses of serum alone. The effect of a second treatment is usually sufficient to arrest the progress of the disease by provoking in the animals treated a more powerful resistance or counteracting the disease itself.

The Menace of Low Fertility

The Term Defined. Its Discouraging Influence in the Business of Breeding Live Stock. Its Natural Result the Extinction of Families in Which it Prevails.

Written for The American Breeder,
By Prof. Ellis Rail, College of Agriculture, Lincoln, Neb.

THE failure of many men who embark in the stock breeding business often hinges on their failure to appreciate fully some few particular influences which may be at work in the herd or flock. They may be competent judges of what good animals are, and thus able to make what would seem a satisfactory selection of individuals for breeding purposes. And they also may be good feeds and managers so that the animals they produce are well developed. Yet many men find live stock breeding unprofitable because there are some insidious influences within their flocks or herds which they have failed to recognize.

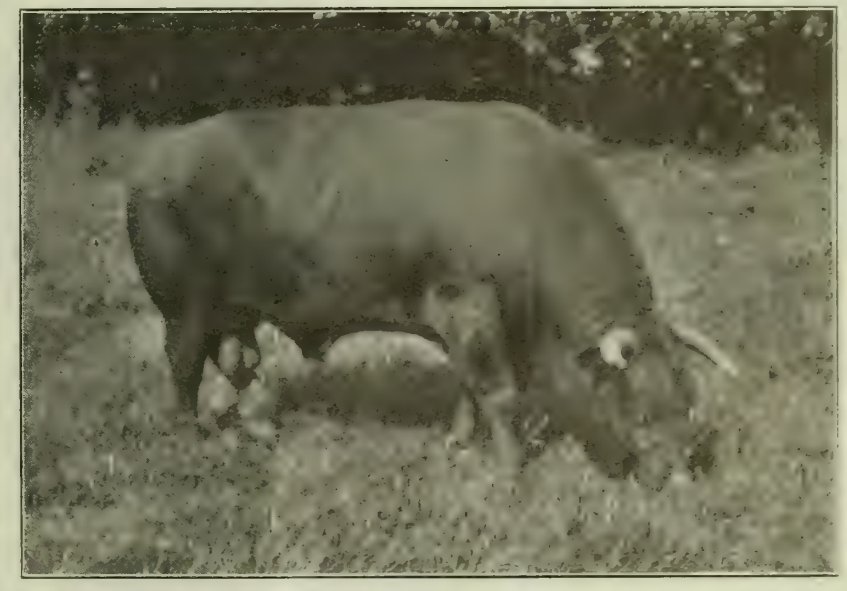
We wish to call particular attention to one of these influences which we believe to be very important, but which a great many men fail to realize the importance of. This is the matter of low fertility or lack of full and regular breeding capacity. One of the first things a breeder should fully realize is that natural selection as well as artificial selection is always at work. This point is well understood in relation to certain characters, but not understood for others. For example most men recognize the folly of trying to breed and perpetuate animals of a satisfactory kind or amount from parents that are very weak in constitution and vitality. Nature decress that such shall not predominate in the race, and accordingly no matter what the artificial selection, we see the weak eliminated and the strong surviving.

In the same way animals of low fertility are severely handicapped in the struggle for existence because the offspring from such animals are not so numerous as are the offspring from animals of high fertility. Consequently, other conditions being equal, or nearly so, the offspring in the next generation are again more numerous from the ancestors of good fertility, and increasingly so. Not only will this be true because of the fact that there are less animals in the second generation that were born of the parents of low fertility, but also because these animals in the second generation will show a lower average fertility than will those from the parents of high fertility. That is to say, the possession of a high degree of fertility is transmissable and is very apt to be passed on from generation to generation.

It may be well at this point to explain what is meant in this article by low fertility. We mean the inability in animals to produce regularly, and the tendency to become barren at an early age. For instance: Many good mares can be got in foal not oftener than every two years. Many cows produce three or four calves during a half dozen years and then become totally sterile. In sows, pigs may be produced but only a few at a time. Nor is this trait confined to females. The sires often show the same short period of usefulness, and as far as breeding is concerned their life period might just as well be only the three or four years that they produce. Such animals are not barren to start with but are irregular breeders, become such, or become totally barren in a short time, and are low in fertility. On the other hand, animals that produce regularly and in large numbers if more than one young is borne at a time and which remain productive throughout their normal life period may be said to be possessed of high fertility. A male that is capable of begetting forty or fifty offspring in a single season is of much higher fertility than one that could beget only twenty-five or thirty.

Now the most dangerous phase of this lack of fertility is not so much its action in any one generation, but the fact that it is transmissable and that if one does not discard the shy and irregular breeders, no matter how good they may be otherwise, one is building up a herd that will not only be unprolific but unprofitable financially. Animals that are unproductive part of the time are too expensive to keep for the chance of what offspring they will produce, and moreover because of the fewer numbers they do bear the opportunities for selection and consequent improvement are materially lessened. To the biologist and student this natural automatic increase of fertile animals over those less fertile is known as genetic selection. Stated in positive terms, the law of genetic selection says that animals deficient in fertility become less and less in proportion to the total number of the breed or type through each successive generation. It is well that the breeder realize then that the introduction of any lack of fertility into his herd is a serious thing, and because it is a transmissable fault, it is apt to become serious. For awhile it may not be so noticeable, but after a few generations the family or strain showing the streak of partial or whole sterility has fallen so far behind normal fertile strains that it is only a question of time until extinction will occur. It is now generally held by many authorities that the operation of the law of genetic selection was the real cause of the disappearance of the once famous Duchess family of Shorthorns.

Now let us look in conclusion at what actually happens in actual breeding work where one ignores the lack of capacity in some of the breeding animals. We have just noted the almost total, if not complete extinction of the Duchess Shorthorns. Let us suppose another case without taking a specific example. If a mare is bred as a 3-year-old and drops a foal at 4 years of age, then skips a year and then produces another colt, and then becomes barren, her total offspring is two young. On the average one of these will be a filly foal and the other a horse foal. Now if the filly foal inherits about the same degree of fertility and would produce only two offspring, then becoming barren, it is easily seen that only one female would be produced in the third generation, and so on indefinitely. Or the original number of females would never be increased, and though a man begun breeding horses with ten such mares, at the end of ten generations he would still have only ten producing brood mares.



Now suppose further, that the mare to start produced four colts instead of two, and the females of each generation produced on an average the same number. In the first generation we would have two brood mares, in the second four, the third eight, and in the six generation sixty-four. If the first mare raised six colts, half being fillies, and each of these in turn were bred and produced on the average three filly colts each, in the sixth generation, 729 colts would be produced. The reader can infer for himself whether the individual female that tends to become barren early is of any value or not as compared with a regular sure breeding female for herd building purposes. The above is merely suppository to illustrate the possibilities.

But let us examine the financial account for one year of a swine herd. The writer knows of a herd of twenty sows, the total produce of which last year sold for approximately $2,250. Of this amount the offspring of two sows sold for one-third of the above amount, the difference being due not so much to the better quality of the offspring of these two sows but because of their large production, they having raised nearly one-fourth the pig crop. Is there any doubt about the economy of retaining such sows or of discarding most of the others? A certain well known Shorthorn breeder has an aged cow whose calves have brought him a small fortune. The quality of her offspring has been uniformly high, but the fact that she was still a regular breeder when more than 20 years of age was the fact that made for her the largest returns. Some of her highest priced calves were dropped after she was 15 years old.

The point of large fertility is one of great importance and not to be overlooked. Any tenednoy toward barrenness in a herd should be eliminated as quickly as possible. We have emphasized it from the female side, but remember that males transmit such characters just as surely and readily as do females. So avoid animals of either sex as prospective additions to breeding herds or flocks if they come from strains of families that carry in any degree this very serious handicap.

Note—The bulls portrayed in this article as examples of fertility were considered exceptional, not only for the length of their period of usefulness, but for their prepotency. Bulls are perhaps more common, the period of usefulness of which is not over four years, even with the usual good care received in a breeder's herd. Editor.

LORD MAYOR 112727 (ON THE LEFT), and IMP. COLLYNIE 135022, FAMOUS SHORTHORN BULLS, THAT DIED AT 16 and 14½ YEARS, RESPECTIVELY, AFTER EXCEPTIONALLY USEFUL LIVES. PHOTOS (BY THE EDITOR) TAKEN WHEN THE BULLS WERE 13 AND 11 YEARS, RESPECTIVELY.

LUMPY JAW OR ACTINOMYCOSIS.

Lumpy jaw is a disease that may attack nearly all domestic animals as well as man, but it is rarely found in any other than cattle. In the latter it is a disease that is wide spread and of frequent occurrence in those districts where cattle abound. It is sufficiently prevalent that every stock owner should be familiar with its cause and nature and strive to prevent its entrance into his herd. It is a disease that is especially difficult to cope with for the reason that it often involves the bony structures, and as every observing person knows, bony diseases are hard to cure.

The cause of lumpy jaw is a fungus substance which grows upon plants, grains or grasses, and seeming-flourishes best in damp, rich soils. These fungus growths are carried into the mouth through the feed and find their way into the tissues through

abrasions or slight wounds. These wounds may be occasioned by scratches or cuts from coarse food or from shedding of teeth. The result is that the fungus gains entrance into the tissues of the mouth, tongue or bone, where it is capable of setting up inflammation, giving rise to enlarged swellings of the parts invaded. It may result in a huge growth taking place about the jaws or throat or of the jaw bones themselves becoming enlarged. Occasionally the tongue becomes enlarged and hardened, which very materially interferes with the animal eating. This phase of the disease is alluded to as wooden tongue. The internal organs of the body are more frequently involved than is ordinarily supposed, and the liver, spleen, lungs, kidneys and other organs may be found involved in disease upon a careful inspection made after the animal has been slaughtered.

In the course of time these enlargements incline to break down and discharge pus, and this only increases the chances of the disease spreading to other stock for the reason that the pus may drop on feed that may afterward be consumed by some other animal. It is bad practice to permit any cow or steer with a discharging wound, especially about the head or neck, to run and mingle with other stock. In attempting to treat lumpy jaw the remedy is largely of a surgical nature, and should receive early attention before it has had the opportunity to spread to the inaccessible parts of the body, where it is beyond the reach of the surgeon's knife. If these cases are taken early and the disease does not affect the bone there are fair prospects that the affected parts may be removed and the invasion promptly arrested. On the other hand, if the bones of the jaw are much affected then the case is apt to prove hopeless and the presence of such an animal in the herd is a constant menace and danger to the well animals.

Whenever one has an animal affected in the manner above described it is in order to seek the advice of a skilled veterinarian before damage is done by the affected animal itself. It is in order at this time to have a careful examination of the teeth made for the reason that they are sometimes responsible for enlargements in the region of the jaw.

It must not be thought, however, as is so often a popular notion, that all big or lumpy jaws are due to diseased teeth. If it appears upon making a thorough examination that there is not reasonable certainty of bringing about recovery, then the animal should be shipped to some of the slaughtering centers where a federal official will pass on the problem of the fitness of the carcass for food.

Drainage of low, wet places will aid greatly in making less favorable the condition for the development of the fungus growth on plants or grasses and this should be given careful study and attention.

"HERDS AND FLOCKS AND HORSES."

Sent out by the International Live Stock Exposition, a well bound volume of the above title, constitutes one of the aptest pieces of advertising that has come to this office. The book is handsome outside and beautifully illustrated within—every photgraveure depicting a pure bred beast of such excellence, or an animal husbandry scene of such attractiveness as to make this feature of the book, in itself a strong argument for the business which has made the Chicago stock yards and the "International." As to the text, the author is hardless less a "Painter of Pictures," than the illustrators themselves, his "Back to the Barnyard" discourse being about as free from the usual prosaic limitations as anything we have read along the same line.

Recognized Record Associations IV

The American Shorthorn Breeders Association.

Everyone interested in improved live stock should know something of the reliable record associations. There are some bogus record associations that have no value, but with names similar to those of some recognized association, an arrangement likely to confuse, if not to actually deceive the public. The names and officers of some of the recognized associations have been changed, which adds to the difficulty which the average breeder experiences in distinguishing at all times between the good and inferior associations.

THE recognized record association for the registration of Shorthorn cattle in the United States is the American Shorthorn Breeders' Association. The name of its published record is the American Shorthorn Herd Book. The first volume of the American Shorthorn Herd Book (started by Lewis F. Allen of New York) was issued in 1846, but registration of Shorthorn cattle proceeded very slowly for some time. In 1882 the American Shorthorn Breeders' Association was incorporated under the laws of Illinois, and in 1883 it bought the American Herd Book, founded by Mr. Allen.

Since the death of the late secretary, John W. Groves, last winter, Roy G. Groves, his son, has been acting secretary. For the past eleven years all certificates of registration in the American Shorthorn Herd Book have been signed either by J. W. Groves, secretary; B. O. Cowan, assistant secretary, or Roy G. Groves, second assistant secretary, now acting secretary. Prior to February, 1901, all certificates of registration for 15 years had been signed by J. H. Pickrell, secretary. Every certificate of this association issued within that time (the past 26 years) should bear the signature of one of these men.

We give below the rules of entry in the American Shorthorn Herd Book and also the rules of the office of the association regulating the transaction of business in connection with registration of animals. Following that are some very helpful suggestions to breeders which the association has prepared.

Rules of Entry.

Rule 1. Pedigrees shall give the name, color, sex, date of birth, name and address of breeder and owner, name and herd book number of sire or his pedigree, name and pedigree of dam, with volume of her record in one of the herd books of the Association, or of the English Herd Book. The animal must trace on the side of the sire and dam to pedigrees not false or spurious already on record, or to recorded English Shorthorns whose ancestors in all their crosses, trace to animals recorded or eligible for record in the first forty volumes of the English Herd Book.

Rule 2. Bulls shall be recorded in numerical order (as checked), and shall not be re-entered, except to correct a material error in first entry, and the corrected entry shall have a new number, to which reference shall always thereafter be made. Bulls recorded in the English Herd Book shall be re-recorded and assigned new numbers and in such cases the English Herd Book numbers shall also be given.

Rule 3. Females shall be recorded in numerical order (as checked), and no cow's pedigree shall be re-entered except to correct a material error in first entry, and the corrected entry shall have a new number to which reference shall always thereafter be made.

Rule 4. All bulls appearing in the lineage of animals sent for record must be recorded, with proper numbers, in the American Herd Book, except they appear in the "Reprint of English Bulls." (See Vol. XXVIII for additional numbers.)

Rule 5. There shall be separate and alphabetical indices of bulls and cows, and of breeders and owners, in each volume.

Rule 6. Well established family names shall not be infringed upon.

Rule 7. Should any person or persons intentionally or knowingly impose a fraudulent pedigree upon the American Herd Book, or misrepresent any material fact, either as regards age, ownership or breeder of an animal in exhibition of the same at the different fairs of the United States or Canada space shall be devoted in the succeeding volume to his or their exposure, and he or they shall never be allowed to enter another animal in the American Shorthorn Herd Book after he or they are convicted by the Board of Directors.

Rule 8. A fee of $10.00 shall be charged for entering the pedigree of an animal over three years of age; provided, that only a fee of $1.00 shall be charged to re-record a pedigree to correct a material error.

Rule 9. In case of animals recorded in the Dominion Herd Book, all ancestry back to the imported animal (which must be on record in the English Herd Book and trace in all its crosses to animals recorded or eligible for record in the first forty volumes of that book) shall be recorded in the American Herd Book, for which a fee of $1.00 each will be charged.

Rule 10. All pedigrees sent for record must be signed by the breeder, or in case of death, by a proper representative, the breeder of an animal being the owner of the dam at the time of service.

Rule 11. After January 1, 1901, a fee of $100.00 will be charged for recording the pedigrees of all imported animals; provided, that this rule shall not apply to animals bred in the Dominion of Canada.

Rules of Office Relating to Pedigrees.

1. All fees shall be paid in advance, and no pedigrees shall be considered or filed for examination until the entry fees are paid.

2. All pedigrees shall be considered in the order in which they are received by the office of the Association; provided, that in case of an emergency or when fees are paid for copying, they may be considered in advance of their regular order, but shall not be advanced thereby for entry in the Herd Book.

3. Pedigrees will not be recorded unless written in ink—on one side of the paper only—and when possible, on the blank form of the Association.

4. Original papers, after being printed shall be kept on file subject to the order of the Executive Committee.

Nov. 23, 1898, the secretary was authorized to destroy the original pedigrees that were on file for Vols. 25 and 26, and to continue to destroy them, one volume at a time, as new volumes were issued. It being the rule of the office to correct errors that were discovered as printed in the Herd Book at the expense of the sender if the original pedigree showed that the error had been made by the party sending the pedigree, or at the expense of the Association if the error had been made by any of its employes. At the same meeting it was

Resolved, That any error or errors that may be discovered in the printed volumes of the American Herd Book, after the expiration of five years, without being previously notified, that the sender of the pedigree shall be at the expense of correcting the same.

Suggestions Regarding Pedigrees.

Write your pedigrees from your Herd Register, and not from memory. Be careful to give all of the information upon the entry blank necessary to complete the pedigree.

Use short names. We do not accept names of more than four words, which must not contain more than 18 letters; assign names to agree with the sex of the animal, and also mark the sex on pedigree of each animal to be recorded. See that the color and birth date are correctly given.

The "breeder" of an animal is the owner of the dam at the time of service. Give breeder's name and post office address following the words "Bred by." Do not omit owner's name and address. Following the words "Got by" give the name and herd book number of the sire, then after the words "Out of" give name of dam, with volume and page of the herd book where her pedigree is recorded (if she has a number use it), then give the name and record number of her sire; next give the name and herd book reference of the grand dam, with the name and record number of her sire. Then have the pedigree signed by the breeder. In case a cow that is carrying a calf is purchased, the party owning the cow at time the calf is dropped may sign the pedigree in lieu of the breeder, provided, they state the facts in the case, but the owner of the cow at time of service must be given as the breeder.

Before sending a pedigree for record read it over very carefully, making any necessary corrections.

The fees for recording are $1.00 each for animals under 36 months old, and $10.00 each for those over that age, and 25c each additional for certified copies. It will cost $100.00 to record the pedigree of an imported animal. Make your remittance by money order, Chicago or New York draft. Never send pedigrees unless accompanied by letter, giving instructions regarding work to be done. Pedigrees are often sent to the office without letter and we are unable to determine who is the sender.

Entry blanks are now printed in books of 25, 50 and 100 each; price 25c, 50c and $1.00, making the cost of blanks 1 cent each. These books are neatly bound and breeders will find them more convenient than the loose blanks. One advantage is that the books are provided with a stub, upon which to keep a full record of each pedigree sent for registration. Another advantage is that they are easier to write on than blanks that have been rolled or folded, and it is much more convenient to keep a book of blanks than to keep a bunch of loose ones.

Every breeder should use this form of blank.

WHAT DO YOU KNOW ABOUT THIS?

Following we print inquiries on two subjects which are important to every man who raises cattle. Instead of making answer to these direct we believe it will result in more good if we can get the views of our readers on the two questions involved. We are well aware that many a sojourn in the stalk field results in little or no benefit to the cattle that take it, but of course this is not the universal experience. It is our belief, however, the evidence of the scales, if taken November 1 and again April 1 of cattle that are "roughed" through the winter, would set many a stockman to thinking. We hope every feeder and cattle raiser who has experience in this method of handling will give all our readers the benefit of his knowledge and judgment.

As to the other inquiry its answering depends a good deal on local conditions. While it very likely would be practical and a good plan in some cases to raise the calves as suggested, there would be other cases which this plan would not fit. This variation in conditions makes a discussion of the question all the more desirable. Let us have the ideas of those who are interested.

"Early last winter I had a small bunch of 2-year-old heifers that I was not in shape to feed at the time. A neighbor had a stalk field that he had husked out instead of cutting on account of the corn being blown down. We did not know what stalk pasture was worth, but agreed that I would weigh the cattle in and pay him so much per pound for whatever gain they made. They were on the field a month and when weighed out showed no gain at all, in fact, a slight loss. The weather was bad, so that did not prove that the stalk field had no value whatever. What would be customary to pay per head or acre under the circumstances? And I should like to know also if any of your readers have kept track of gains made on stalk fields, so as to be sure that the corn stalks were worth anything to them at all."—Nebraska Subscriber.

"What would you say about the practicability of raising a crop of calves on half of the cows, weaning the calves from the other half and breaking them to milk? We have about 20 Shorthorn heifers that will calve this spring, and most of them ought to be fair milkers. We were thinking of making ten of the heifers raise two calves each, supposing that we get that many calves, and make milk cows of the balance. We do not like the idea of milking the cows just to feed part of the milk back to the calves, especially as we have never seen calves do as well where the milk is fed to them as where they get it in the natural way. I would like to hear the experiences of other readers as well as to have your own answer on this subject."—Oklahoma Subscriber.

Uplift the farm home through the education of the farmer's daughter toward greater usefulness and attractiveness in the farm home.—From the 1911 report of the United States Secretary of Agriculture.

Better Management of Pastures

Combinations of Grasses and Legumes Adapted to Different Sections. Rotation—Where Advisable and Where Not. Evils of Burning and Close Grazing.

Written for The American Breeder,
By Prof. A. M. Ten Eyck, Professor of Farm Management, Kansas Agricultural College.

DOMESTIC grasses and combinations of grasses, and legumes adapted for pasture in different sections of Kansas may be named as follows: (The figures indicate the number of pounds to sow per acre).

Eastern Kansas.

1. Meadow fescue (10), orchard grass (10), bromus inermis (8), and medium red clover (6) or alsike clover (4).

2. Meadow rescue (10), timothy (6), redtop (6), alsike clover (4), especially on the wetter lands.

3. Bromus inermis (14) and clover (6) or alfalfa (6).

4. Kentucky blue grass (24) and white clover (4).

Central Kansas.

5. Bromus inermis (10), orchard grass (12), Western rye grass (8), common red clover (6), alfalfa (6).

6. Bromus inermis (16), alfalfa (6).

7. Bromus inermis (20). (Bromus inermis can not be recommended for general planting in Southern Kansas).

8. Meadow fescue (15), orchard grass (15), clover (6), alfalfa (6). (Southern Kansas well watered lands).

Western Kansas.

No. 7 as above.

9. Native prairie grasses.

10. Bromus inermis (14), Western rye grass (8), alfalfa (6).

11. Bromus inermis (14), tall meadow oat grass (12). (Tall meadow oat grass is recommended for dry climate and light soil).

Bermuda grass is not considered fully hardy in Kansas, but it is now being grown successfully in a small way in the southern counties of the state. It is recommended for further trial, especially if the roots for propagation are secured from Kansas fields.

A consideration of the three sections of Kansas will enable one to adapt these suggestions to a great deal of the adjoining territory.

Advantages in Combinations.

Combinations of grasses and perennial legumes are usually to be preferred to any single grass, both for pasture and for hay. They are especially desirable for pasture, giving continuous grazing, a greater product, greater variety and perhaps a better balanced food ration. In choosing grasses for pasture the object should be to select such varieties that the deficiencies of one variety may be balanced by the good qualities of another. Another object should be to select those that are different in their periods of growth and in their dates of maturing, so that by lengthening the grazing period continuous grazing may result. Combinations of grasses may be made which may produce a more perfect sod and a more permanent pasture than is possible for any one grass.

As a rule a little clover or alfalfa should be seeded with every combination of grasses, whether for meadow or for pasture. The true grasses, so far as science has discovered, take all of their plant food from the soil, but the legumes, such as clover and alfalfa, utilize the free nitrogen of the air, aided by the bacteria which grow on their roots. Instead of exhausting the nitrogen of the soil the legumes tend to increase the supply and act as "feeders" to the nitrogen exhausting grasses. It is very important, therefore, that every pasture or meadow should contain some perennial legume, because the presence of these nitrogen gatherers not only causes a greater yield of the other grasses, but also makes the soil more fertile for the growing of other crops. It should be noted here that when combinations of grasses are seeded for meadow care should be taken that only those varieties are sown together which mature at about the same date, otherwise it will not be possible to produce the largest yield of hay of the best quality. It will be observed that exactly the reverse is true when grasses are combined for the purpose of producing pasture.

Rotation of Pastures.

The writer recommends the use of the grasses as temporary meadows and pastures in rotation with other crops, where this is possible. When the meadow or pasture decreases in productiveness the plan should be to break the sod and to grow other crops for a few years before again seeding the field to grass. By this method larger yields both of grass and of grain crops may be secured apparently without greater exhaustion of soil fertility than may result from continual cropping with grain. In fact, the usual result is that the soil remains more fertile by such a system of rotation. This is due to the protection which the land receives while in grass, to the improvement in soil texture to the accumulation of humus, and to the extra fertilization by the manuring which occurs from pasturing stock on the grass land. Occasionally, however, it is advisable to keep a field in grass as long as it may be profitably used for this purpose. Low, wet lands, rough or stony lands and sloping, washy lands are often better adapted to grasses and legumes than to grain crops, hence it is desirable to keep grass growing on such land for long periods.

As meadows and pastures grow old they become sod-bound and less productive. The available fertility of the soil becomes largely exhausted, and much of it is locked up in the immense root-system which has been developed by the thick growth of the grass. If the field is one which can be used profitably in growing other crops the best plan is to break the sod and seed new fields to grass. If, however, it is desired to continue the use of the meadow or pasture a new growth may be secured by partially breaking or by thoroughly disking and harrowing the sod in the spring. This will have the effect of destroying some of the grass roots, which soon decay, furnishing plant-food for the new growth of the grass. Disking also loosens and aerates the soil. This mulch of mellow soil conserves the soil moisture, thus favoring the growth of the grass. Grasses which spread from the root are most successfully renewed in this way.

There is no better fertilizer for grass than farmyard manure. A top dressing applied during the fall or early winter will serve during the winter as a cover to protect the grass roots from the extremes of temperature. As spring opens the rain carries the nutriment from the manure to the roots of the grass, stimulating an early spring growth, which may continue throughout the season. During the summer the manure acts as a mulch to keep the moisture in the soil, thus protecting the plants more or less from the influence of drouth.

There is no more convenient place to haul the manure than to the grass land, and there is no crop which responds more readily than grass to the application of manure. It is not necessary to wait until the pasture or meadow is old and worn out before making liberal applications of manure. When the purpose is to plow the sod the manure should be applied a year previous to the breaking. This will produce larger crops of grass during the season following the application of the manure, and by increasing the root growth will add to the humus of the soil, leaving the land more fertile for succeeding crops. Thus the manuring of grass land results in a double benefit, as compared with the manuring of corn or other grain land.

A SECOND GROWTH OF RED CLOVER OFTEN GIVES CATTLE A GOOD BOOST AND THEIR PASTURE A NEEDED RELIEF AT A CRITICAL TIME.

Many farmers turn the live stock into the meadow after harvesting the hay crop and depend upon the meadow to furnish the late summer or early fall grazing. When there is a vigorous aftermath and a second crop of hay is not desired no harm may result from such pasturing. In fact, the grazing may be beneficial, since a heavy mulch of dead grass tends to smother the meadow during the winter or to retard the early growth of grass the next spring. It is not desirable to burn the heavy grass growth in the spring because burning wastes the nitrogen and exhausts the soil humus. However, it is almost necessary to burn a heavy covering of dead grass because if left on the ground it not only checks the new growth but it interferes with the mowing and injures the quality of the hay. The meadow should not be grazed too closely or too late in the fall, since late, close grazing will leave the grass with little winter protection and may result in weakening the plants so as greatly to retard their growth the next spring.

Timothy is easily killed by too close grazing, but this is not equally true of all grasses. Permanent pasture grasses, such as Kentucky blue grass and the wild prairie grasses, may be pastured late in the fall without injury, provided the grass has been allowed to make a vigorous growth in the late summer and early fall. This may often be accomplished on a well managed farm by using the meadow aftermath for pasture as described above, allowing the grass in the regular pasture to make a rank growth during the early fall.

Care of Pastures.

The productiveness of any pasture grass will be very much reduced by continued close grazing, for the leaves are the lungs and the stomach of the plant. In the leaves carbon from the air and water and mineral plant-food elements from the soil are brought together and in the presence of sunshine, chlorophyl and life-giving oxygen the complex products are made which sustain the life of the plant and cause growth. The bad results of close grazing at any time weakens the vitality of the plants so that they may not start quickly and vigorously in the spring. Grass should not, as a rule, be pastured the season it is sown. If the season has been very favorable, and if the grass has grown luxuriantly, it may be pastured lightly in the autumn. Close or late grazing should be carefully avoided because the young plants need their green leaves in order to produce a vigorous root growth.

Grass becomes less palatable to stock as it matures and forms seed. In order to maintain a fresh, vigorous growth tame grass pastures should be mowed before the seed-heads mature. It is advisable also to mow permanent pastures once or twice a year to prevent the seeding of weeds and to destroy buck brush or other plants that are likely to start in places where the grass has become thin. Grasses in permanent pastures or meadows require more care than those that are grown in rotation with other crops. It is advisable to reseed permanent pastures occasionally. They must also be fertilized with manure or chemical fertilizers in order to maintain their productiveness. Occasionally it is advisable to cultivate such grass lands by dyking and harrowing early in the spring. The reseeding and manuring should come preferably at the time of cultivation.

There is still much native grass land in Kansas; and if permanent pastures and permanent meadows are desirable these lands had better be left in grasses, since there are no grasses better adapted for permanent pasture or permanent meadow in Kansas than the native grasses which grow on the Kansas prairies. As yet these wild grasses have not been domesticated so that they can be reseeded successfully. This is a work which the experiment stations must accomplish in the near future. It is possible to greatly improve some of these wild grasses by cultivation by selection and breeding. Among the more valuable permanent wild grasses in Kansas are the big and little blue stem, the buffalo and grama grasses, prairie grass, prairie oats, Indian grass and switch grass.

Burning Off Pastures.

It is a common practice in Kansas to burn off the prairie pasture in the spring. In the judgment of the writer this is a useless practice, for by dividing the range and by careful management as suggested above, it is possible to keep the pastures grazed down sufficiently so that they will not require burning. While a heavy growth of dead grass in a pasture is objectionable, a mixture of old

and new grass may be preferable to new grass alone for early spring pasture. When cattle are changed abruptly from dry feed to young, green grass, the too great laxative often causes scouring and the cattle frequently lose in weight for a few weeks. This check in growth may be largely avoided by a judicious mixing of dry feed and green feed, such as may occur if a short growth of dead grass remains in the pasture. It is not advisable to burn a part of the pasture and to leave a part unburned, since the stock will then feed mainly on the burned portion, grazing the young grass very closely. This may result in permanent injury to the pasture, or at least may result in decreasing the amount of grazing for the single season.

BEEF-BRED CATTLE AUCTIONS THUS FAR.

The year's most important season of public sales of beef cattle is yet to come, namely, the sales of May and June. These sales will doubtless go higher than has been the rule in sales held thus far since the beginning of the year. In a dozen representative sales of Shorthorn cattle, beginning with the Association Sale held in Denver, 519 head have been sold at an average price of $169. An equal number of Herefords, sold during the same time, but in just half the number of sales, brought an average of over $137. The larger size of Hereford offerings naturally resulted in somewhat lower averages than would have been the case had the total number of cattle been divided into smaller offerings. In a general way it may be said that the Hereford sales were just as good as the Shorthorn sales.

In neither of these lists of sales we have taken into consideration was there anything to indicate that an upturn in price has more than barely begun. Perhaps half these sales were held under adverse weather conditions and at a time when a great many farmers and stockmen could not say that they had a week's supply of feed ahead. Under such conditions a great many people who needed cattle and were confident that the animals being sold were worth more money were, nevertheless, obliged to keep out. In only one sale of each breed (that we have considered) did show-yard value in the offering influence prices, and even then prices could hardly be said to respond to a great extent. The highest price paid for a Shorthorn was $1,700, and this for an admittedly excellent bull, with the best bulls of the United States as a standard. In one of the Hereford sales practically as good a bull, but with less show-yard reputation, sold for $1,000.

GOOD TEXAS CATTLE PRICES.

In the old days the meeting of the Texas Cattle Raisers' Association was the occasion for bringing buyers and sellers together, says the Fort Worth Live Stock Reporter, and hundred-thousand-dollar trades were made with ease. Most of the important contracts were made then. Now it is different. The cattle are not in the state to be sold. A few sales were made at the last meeting, but they were very few.

Col. Charles Schreiner of Kerrville sold to Mr. Corder of Sanderson 10,000 3 and 4-year-old steers for spring delivery, probably to be taken above the quarantine line

The XIT ranch sold to Kansas parties 2,000 4-year-old steers on range north of the Canadian River for $55 per head. The steers had been wintered there and not fed.

One of the highest prices ever known for bred cows has just been recorded in the sale of 500 head to Joe Montague of the O9 ranch by Robert Massie. The price was $32 per head. The contract calls for delivery on the O9 ranch May 1.

The Future as Breeders See It.

How Feeding Difficulties Have Been Overcome. Lesson of the Pure Bred Steers.

To the American Breeder: The spirit of discontent among the breeders of pure bred stock seems to be on the increase. Would it not be wise to sound a note of warning and call attention to the fact that the worst is over. Grass is with us again and the prospects for the best era of prosperity that ever fell to the lot of the American breeders is at hand. The next five years will be hummers, and the breeder that sticks to his herd will reap a rich reward. If breeders must reduce their herds, urge them to sell only the tail ends, but by all means to stick to the tops. They are sure to win.—Chas. E. Sutton, Douglas county, Kas.

Farmers Back to Beef Making.

To the American Breeder: That the cattle breeders of the corn belt have been up against it the past few years goes without saying. High cost of production and markets flooded with the clean-up of the Western rangers have kept profits out of the deal. But conditions are different now; cost of production may, and probably will, continue as high, but the range country will not begin to furnish the beef it has been sending for the past twenty-five years, and the corn belt farmers will be called upon to supply a much larger percentage of the beef supply than they have been doing, and that call will be made in the form of higher prices, and such a call will and should be heard. In fact, farmers have not, in my recollection, paid as high for grade cows for breeding purposes as they are doing now; showing that they are preparing for the good times to come. The breeder of pure bred stock must wait a little longer, but his time is coming, and it will be as good as he has ever seen. The general farmer is going to pay more attention to good blood than ever before, and the pure bred herds will benefit by it. Just stay with it a little longer and reap the reward that is bound to come. The early '90s were worse than the past five years have been, but the years following were great. The tide is bound to ebb and flow, and it certainly looks to me as though we were to have flood tides soon.—John R. Tomson, Shawnee county, Kas.

How Silage Solves the Feed Problem.

To the American Breeder: To one not accustomed to a large herd of cattle the problem of providing plenty of feed at a reasonable cost seems to many impossible to solve. We are often asked the question, "How can we get feed enough for so many?" Supplying feed at a reasonable cost has long been the stumbling block to producing cattle at a profit, and this accounts for the scarcity of cattle in our country over, today.

A few years ago we thought we had solved it with shock corn and clover hay. That was all right when land was cheap and clover hay selling at $3 to $5 per ton. With the advance of our land we came to realize that we could not produce enough tons of clover hay per acre. About that time we became acquainted with the value of alfalfa, and to think we could produce from four to six tons per acre looked like we were on the right track. This was right about the time when everybody found out what good feed alfalfa was; consequently the price has risen until it can not be fed alone to cattle at a profit. A cow or steer will eat two and a half tons of alfalfa in six months, at the least, unless something as a cheaper feed is supplied to fill in.

So we tried cane hay. On good ground we can grow from four to seven tons of cane hay per acre, and we believe it to be the best cheap feed we have yet found in the hay line. We prepare the ground well in May and drill two bushels of seed to the acre; let it get nearly ripe, then cut and put into large shocks before frost. We have raised from 60 to 75 tons every year for the past ten years, and it saved the day for us in 1911, for in spite of the drouth we produced five tons to the acre. Some say cane is hard on the land, but it does not prove so here. We have grown four crops in succession and then put it in oats and seeded to clover, getting a splendid stand, and the land produced the best of hay. The ground seemed loose and free from weed seeds. We will sow 15 acres this season.

But even this does not entirely fill the bill for cheap feed, for a large amount of alfalfa, or other protein feed, must be used to balance, and then we were feeding shock corn every day in the morning, giving the cane in the afternoon.

Three years ago we were convinced that the silo was the missing link. So we put up a concrete silo and put the same shock corn into the silo, but in an earlier stage of cutting. If all could only know how pleased we were with the results every stockman having 25 head of horses and cattle would surely build a silo at once. Since then we have put up two more concrete silos, and our troubles, as to producing enough feed at a low cost, are at an end.

Two and half tons a day of good ensilage will feed 150 head of stock in great shape, and along with a quarter of a ton of alfalfa or good clover makes the feed we have been looking for. This winter we had only thirty tons of alfalfa hay and 250 tons of ensilage and 50 tons of cane hay. Yet we came through the winter in better shape than if we had fed 200 tons of good hay, 50 tons of cane, some shock corn (corn and all) with 15 bushels a day of grain added. Any one can figure the difference in cost, especially this year, with ensilage. Very little grain is needed, and this only for the calves, cows heavy in milk and the show cattle.

Our show herd has been carried this winter on ensilage and alfalfa hay, with a little bran and a very small amount of chop added, at a cost of $3 per month per head. On full feed when on grain and alfalfa no one can feed them for $6 a month, and as to gain, from two to four pounds should please anyone. They are in the best condition we have ever had them. And to think—at half the cost! What it will do here it will do for any one having cattle to feed.

Ensilage is the only feed that is cheap enough to be fed on a large scale. Twenty acres of corn that will make 30 bushels to the acres will fill a silo 16x38 feet, usually costing $15 an acre, and the cost of putting into the silo is nearly $3 per acre, which makes a 16x38 feet silo, full of good feed, cost $360, or less than $2.50 per ton. This will feed 150 head of cattle for sixty days and make them gain nicely.

One more thing in favor of this way of feeding is the cost of labor. One man can feed 150 head as easily as he could feed 50 in the old way. With the high price of labor we believe we have solved the feed problem.—C. S. Nevius, Miami county, Kas.

Object Lesson With Pure Bred Steers.

To the American Breeder: The winter has been so severe and the scarcity of feed has had a very bad effect on all cattle raisers, but there has never been a time in this country that I have known that looks more promising for the future. Breeders should hold on to their good breeding cows now, and with a good crop of corn and good grass registered beef cattle will be so scarce that you can not buy them. Take, for instance, young bulls; they are worth more now in Kansas City than farmers are willing to pay for them. Now is the time to get rid of all that kind of stock; weed out the poor ones and raise nothing but the good ones in future. There is one thing certain, farmers and breeders must be better prepared for the winter. The silo is the thing. Last fall a silo was put up here, and I would not believe that such a lot of stock could be carried through on so small a ration. Our cows are fat and the calves are fit for the market with only a very little hay once per day. Our cows have not eaten as much hay as they wasted last year, and we have hay and ensilage left over, enough to last until June 1.

I have heard great complaint that small breeders could not sell their young bulls. Now that is the problem, and I have tried to convince breeders to be more free with the knife. I will give you an instance of my own experience: A year ago last December I came here, and the first thing I saw was a lot of cows and calves.

"What are you going to do with those bull calves?" I asked.

"Oh, I can get $45 or $50 for them next fall," was the answer.

"Use the knife," I said, which we did.

We saved the best one and sold him last fall for $75 at a sale. He was a good calf. The steers were carried on a month longer and sold the last week in November and made an average of $87.50 each. Their average weight was 1,100 pounds. Most of them were June and July calves. Now the shortage of beef cattle and the price feeders are paying for stockers must insure a good market for all kinds of breeding cows and heifers. Farmers and breeders must have more breeding stuff, as they will all have to raise more calves. That is where we must all look for supplies for our beef market.

I would advise all breeders of beef cattle to hold on to their females for a time at least. Cut out the poor cows and heifers—send them to market. Stay in the beef cattle business and make money.—Thomas Minton, Coffey county, Kas.

SILAGE VS. BLUE GRASS AND ALFALFA.

More than ever before, the stock growers of this country have gotten in the way of figuring definitely on the cost of the stock feed which they use, and some surprising information has been developed as a result. Twenty years ago, with much cheap labor, with cheaper and in some cases more productive land and with remarkably lower prices for nearly all live stock feed stuffs, a feeder or stock grower could take his chances on a good many things. Now the man who takes his chances on these items is subjecting himself to almost certain ruin. To illustrate how risky it is to take for granted that any feed is economical, we call attention to a passage in the letter from Mr. Nevius, in which he says alfalfa hay, under present conditions, is too expensive to feed exclusively for roughage. It sounds almost like heresy for a stockman in Kansas to question the advisibility of feeding alfalfa hay under any and all conditions, but Mr. Nevius is not a man who allows himself to be governed by a vogue, and his loyalty to alfalfa, which he greatly admires, as his letter shows, was not allowed long to mislead him. His reasons for the stand he makes are very brief and equally hard to answer. "It takes two and a half tons of alfalfa, if that is

the only roughage given, to feed a cow or steer six months," he says, "and you can figure for yourself what that would have done to a man the past winter." Mr. Nevius, like many another, has sought cheaper and more wholesome feed throughout his career as a breeder of cattle, and has gone from good to better and finally to what he considers best in corn ensilage. In this connection we recall a quotation from the speech of Professor Minford at the stockmen's meeting in Bloomington, Ill., the past winter, in which he referred to a statement he made some time before that breeding cows could be wintered more cheaply on ensilage than they could be carried through the summer on blue grass pasture. "Many do not believe it," he said, "and they did not let me forget that I had said it, but I repeat it today. On land worth $100 and upward, suitable for growing corn, you can carry breeding cows through the summer cheaper on ensilage than you can on blue grass.

"Not many pastures will carry a cow and her calf on less than one and one-half acres. But it is entirely possible to get 12 1-2 to 20 tons of silage from one acre, and you can carry a cow and calf during the summer on two pounds of clover hay and 35 pounds of silage per day, as well or better than on blue grass. Thus you can keep a cow a year and her calf six months on less than a half acre of silage. If eventually Illinois comes to producing its feeding cattle it will come to use the silage for summer as well as winter feeding. I had to be shown this."

SIGNIFICANT LIVE STOCK FIGURES.

Live stock figures from Missouri have a special interest, for they show the trend of the live stock business as do the figures of probably no other state. Missouri may be said to be the commercial center of our great meat producing territory. While in no sense a range state, it has an unusual proportion of land which, on account of the roughness and inaccessibility to railroads, is better utilized for grazing than in any other way. This makes the Missouri live stock population less subject to fluctuation from heavy shipping for any cause than the other states similarly located, but better supplied with railroads and less supplied with grazing land.

The April figures of the Missouri State Board of Agriculture show that less than half the average number of hogs were, at that time, to be found on the farms of the state. An average of reports from correspondents all over the state showed that there were only about 67 per cent as many brood sows on the farms as in an average year. The crop of young pigs was reported as even smaller proportionately, while the live stock of hogs on feed was so low as to bring the total down to the 46 per cent given above.

Reports from all over the state indicated that the number of cattle on feed was about half the usual number. The percentage of breeding cattle was not given in this report, but the tide has turned in this regard, and there is shown everywhere a disposition to retain stock cattle that are good enough to make them desirable for building up the herds of the state.

To The American Breeder: Find enclosed check for the ad of jacks. I have had some sales and still have lots of inquiries, and still have some good ones I can spare. Thanking you for past favors. J. E. Park, Clinton county, Missouri.

To The American Breeder: Enclosed find money order. Discontinue my ad, as from the number of inquiries I am receiving I certainly will be out of stock before your next issue comes out. A. T. Loomis, Thomas county, Kansas.

Why I Started in Pure Breds

Some Interesting History and Sound Reasoning (and a Little Breed Boosting) By Breeders Talking From the Text of the Headline.

ALWAYS instructive and often full of inspiration and encouragement for the beginner, or the man who plans to begin, are the accounts by experienced breeders of how they come to be in the pure bred live stock business. As they usually recount mistakes as well as successes they give the reader a safe idea of what can be expected in the business and protect him against loss of time and money from similar causes. We consider these breeders' experiences of such value that we will gladly give space to them at any time. The following selected for this issue are from men representative of the pure bred cattle business of the territories in which they live.—Editor.

An Oklahoma Shorthorn Breeder.

I am breeding improved live stock for the simple reason that I can make more money on less land and by feeding a less number of stock than I can by raising the poor grade. In explanation as to why, I will give a little of my own experiences.

Several years ago I remember well of feeding 66 heifer calves. Cattle were low then. I bought them for 2½ cents per pound. I fed them shelled corn and alfalfa hay all winter and in April I shipped them to the National Commission Company at Kansas City. The morning they arrived Caley Adams, my salesman, told me he was offered 5 cents per pound for the heifers with a few out at $4.55 per hundred. This was very agreeable information to me, as that was what I had been feeding for—the nickle.

After we had sold and weighed up I was walking around the yards to see what I could learn. I came to a Kansas man standing on the fence with a bunch of good heifers in the pen beside him. I ventured to ask him if those were his heifers. He said they were. Then I asked him if he had sold them, and he said he had, for $5.50 per hundred. This caused me to hang my head a little, but I soon decided to ask Caley the reason. I realized that there was something I did not know that caused this difference, as my heifers had been fed corn all winter and he said himself that his had not been fed at all, just shipped them in off of his wheat field. As soon as I had an opportunity to ask Caley about it I said:

"Caley, you know, as I have already told you, that I was well pleased with the sale you made for me."

"Yes," he said, "I thought you were."

"Well, I am," I said, "but there is some information that I believe you can give me if you will."

"Very willingly, Lookabaugh, if I can," he replied.

"Tell me why his heifers brought 50 cents per hundred more than mine when his had not been fed corn at all and mine had been fed corn all winter."

Well, he hesitated a little and then said:

"His heifers have more quality than yours, haven't they?"

I was green and did not exactly understand him then. I said:

"Quality. What do you mean by quality?"

"Well," he said, "look at those flat backs; see how they are flanked down; notice the steak on one of those heifers from Kansas. They fill out better; they furnish a larger per cent of dressed beef, and that is what brings the packers or butchers the returns."

I thanked him. He had opened my eyes. To make a long story short I went home and made a more careful selection of steers for the next winter's feed. The result was a little better, I might say, but so little that I came to the conclusion that if I wanted to compete with those Northern men I would have to get a better quality of cattle, and the way I decided was that the cheapest and quickest way to get them was to buy me a registered male and raise them. This I did, and when his calves were a year old they weighed 1,000 pounds, and the neighbors were buying them for bulls at $50 a piece. I did not have any steers left to feed, consequently I kept on raising bulls. I soon saw that the grade bulls were not going to breed like the registered bulls did. I had a call for a registered bull and did not have one. I got me some registered cows, and now I am in the Shorthorn business. The more I saw of the better kind the better quality I wanted, and if I were giving advice to a young breeder just starting it would be to buy the best and not so many of them.

There is such an advantage in a registered male—it matters not what kind of stock you are handling—that I wanted to proclaim the good tidings to all my friends in Oklahoma. Therefore I went to raising Shorthorn cattle, big boned Polands, Percheron horses and Collie dogs. The latter I give to my friends and neighbors as soon as they are old enough to wean.

There is a great deal more that could be said in regard to the kind of stock that is better adapted for the farm, but this I will leave for another time. I might say in conclusion that I am young in the business and do not think I know very much, considering the amount there is to learn. But I believe that if a young man has the ambition to be of more good to the world while he is here, to attain a higher position in his farm life, and individually be come a much better man himself, that this is a very good road to pursue.—H. C. Lookabaugh, Blaine county, Ok.

PRODUCTS OF A HERD THAT WAS FOUNDED AS THE RESULT OF A STOCK YARDS LESSON.

A Colorado Hereford Breeder.

In 1883 as a young man I caught the fever then existing generally throughout the West, to go into the cattle business and reap some of the fabulous returns which the cattle barons were credited with garnering from running cattle all the year round for nothing on Uncle Sam's free grass.

In connection with my brother and an uncle I started a small ranch on the plains of Eastern Colorado, and went to Iowa and bought about 200 head of the best grade breeding cows we could get, and enough thoroughbred bulls for use on the same. These cattle were about all Shorthorns and raised in the vicinity of the State Agricultural college at Ames.

The condition of the free range in those days can be pictured when I state that for the first few years we were in business we branded 95 per cent of a calf crop off these cows every year, and for three consecutive years, as our steers matured, we sold 3-year-old steers right off the grass for Christmas beef in Denver, without hay, or grain, that averaged better than 1,300 pounds.

These halcyon days soon passed, never to return. Overstocking and overcrowding on the free public ranges soon reduced the weight of our steers so that 3-year-olds only weighed about 1,000 pounds and sold for feeders instead of beef. Calf crops dropped from 95 per cent to about 30 per cent. Something had to be done.

The first noticeable improvement we made was to substitute Hereford for Shorthorn bulls. The latter breed of cattle did all right as long as conditions were favorable and feed plentiful, but they did not make the best of adverse conditions that overtook us. We found the Hereford did, and made the best of conditions as he found them, got along somehow when feed and water were short, and when better times came along was not slow to take advantage of the same and made his returns accordingly.

The range business has gone from bad to worse, until now I am not sorry to say it is a thing of the past in this part of the country.

In 1900 I sold out my interests in the firm of Painter Bros. and bought a neighboring ranch that cut a great deal of wild hay. I bought all the land I could afford to—and more, too—and once more started a grade herd. I found after running my grade herd on my preserved pastures all winter and feeding them considerable hay besides, on turning them on the free range in the summer time they fell off in flesh at the time they ought to be putting it on, that I could not get over 35 per cent of a calf crop. This did not pay. I remembered the old conditions of 25 years ago and concluded to just run what breeding cattle I could handle on my own pastures and never eat them down closer than our range used to be eaten in the halcyon days I referred to above, and see if I could not keep my cattle looking as they used to do then.

Fewer cattle had to be run necessarily, yet it was also necessary the net receipts should be about the same to pay running expenses, hence there was only one way, and that was to run better cattle and make the same

profit out of one that formerly was made out of three or four.

In 1906 I bought my first herd of registered Herefords. My neighbors pitied me; they thought I had become unbalanced and saw ruination staring me in the face. I am glad to say I am still on the outside of the poor house, and also pleased to record my neighbors are not nearly so afraid of thoroughbreds from a financial standpoint as they were. My next door neighbor's pure bred Angus calves won first in the car-lot of feeder calves at the late National Western Stock show in Denver, weighing 548 pounds and selling for 7 cents per pound. Do thoroughbred cattle pay? Most certainly. Of course good judgment, the right kind of thoroughbred stock, the proper method of running them must be applied, and perhaps most important of all, close attention to business is essential.

I sold my first herd of registered cattle before I had owned it a year, because I found they were not the up-to-date type. I soon realized my would-be customers wanted the best bulls the breed afforded and generally knew them when they saw them. The next bunch of Hereford cows I got cost me for each animal the same price I sold three of the first bunch for, but it paid, and paid well. I have yet my first bull of my own raising to keep until he was 18 months old, unless it was something not in the market, and I might say the prices received have been highly satisfactory.

The present prices of beef cattle are such that they can be profitably kept on any farm in the country, no matter how high priced the land is, if the right kind of stock and the right methods employed in handling them. The day of the scrub has gone. The conservation of the fast diminishing fertility of our soils demands that these market conditions shall continue to exist, and I believe the consideration of this matter is the most serious that confronts the American farmer today. Is he going to allow the organized non-producing classes to so influence legislation that his products shall be cheapened so that it shall once more, as in the last two decades, become unprofitable to maintain live stock on our high priced lands? Should this condition be brought about it is only a matter of a few years, through the continued depreciation of our soils, if no fertilizers are put back on the land, until it will be necessary to import breadstuffs as well as meat to feed our fast increasing population.

The farming and stock raising interests are largely unorganized, and hence their interests are very much handicapped in the legislative halls of the nation, when confronted by the strongly organized, non-producing classes of manufacturers, middlemen and labor.

It is of the utmost importance that each and every farmer and stockman should aid in every way possible, both singly and collectively, the efforts of the American National Live Stock Association before Congress in their struggle to protect our mutual interests. Let your senators and congressmen know how you feel on these matters when they come up, as they surely will. Write them personal letters. —John E. Painter, Weld county, Col.

A Kansas Galloway Breeder.

A herd of pure blooded, well bred cattle is much more beautiful and far more interesting than one of scrubs, of all shapes, sizes and colors. The more interest one has in his stock the more thought and care will be given them. Another point in favor of pure bred cattle is they will always sell for more than market price, are always in demand. Again pure blood enables one to establish desirable traits, more substance, weight bone and beauty of outline. I am always looking and planning ahead and watching developments from certain crosses in order to produce some of the desired points, therefore making it an interesting study at all times.

One would hesitate to use scrub stock for the foundation of a work on which he wished to continue all his lifetime, and it costs not a cent more for his time, labor or feed to care for and support a herd of pure-bred stock than of the other kind. And there is a feeling of satisfaction when working among them and thinking of them, which I have failed to experience as owner of grades. My aim is to feed for growth and healthy development and to give them good, strong constitutions.

The Galloway I find to be better adapted for this and the range countries for many reasons. First, they seem to adapt themselves more readily to the different climates. Nature has provided them with a coat of hair that when dressed by a furrier, who takes all of the coarse hair out, equals that of the otter, and in its natural form is superior to buffalo for robes, and is used for overcoats, sacks, capes and other articles of rare value. This coarse hair, however, is very essential with the animal. All fur-bearing animals have it. When they go into water this coarse hair laps over the fur; that prevents water from penetrating the hide. This same theory explains why the Galloway will stand all day in the rain and remain dry; this same coat of hair answers for protection against the sudden changes and severe blizzards subject to most of our range countries. During the severe winter just passed I have had one instance reported to me whereby a herd of grade Galloways in the center of the most severe district, where some herds experienced losses of over 30 per cent, this Galloway herd had no losses, and one of the most remarkable things of all had two calves dropped during the blizzard, and both lived and are hearty and good.

At the International Live Stock Exposition during the past ten years Galloways have won one reserve champion, four first premiums and many seconds and thirds. In carcass classes four firsts; two seconds, two thirds and three fourth premiums. It is remarkable to note their winnings in these carcass contests. With but one or two exceptions every Galloway shown in the carcass classes has won premiums. In the fat carcass lots at the same show only eight loads of Galloways have been shown and six of them were prize winners. In the range and feeder classes at the American Royal at Kansas City there has been just three championships offered, and two of them were won by Galloways. When we consider the very small number of Galloways exhibited in comparison with the other breeds their winnings are remarkable.

Another thing in favor of the Galloway is that on farms and ranges the breeding cows will come through the winter in good shape on rough feed that goes to waste on most farms. No breed will make more profitable use of the rougher feeds than will the Galloway, and this is a most important factor to be considered in these days when our farm lands are increasing so rapidly in value.—C. E. Clark, Shawnee county, Kas.

A Kansas Polled Durham Breeder.

In 1901 I bought some land. The next step was to stock it. As I was raised on a farm and all experiences had proven to me that the best stock was the most profitable, I decided on the Double Standard Polled Durham cattle for my foundation, and I am more than pleased with my choice. My advice is, keep less stock and better, and the profits will be greater. Keep your own bulls and don't breed them outside your own herd unless you know the outside cows are all right.—D. C. Van Nice, Shawnee county, Kas.

Results From Organized Effort

How the Proposed Increase in Stocker and Feeder Rates Was Prevented. The "Bubbly Creek" Investigation at the Chicago Stock Yards, and Other Services as Important.

A few weeks ago, stock and farm papers all over the West, published the news of an Interstate Commerce Commission ruling that meant the saving of thousands of dollars in freight charges to the shippers of stocker and feeder cattle. The order was a just one and vastly beneficial, and won friends for the law creating the commission. But probably few people realized that it was really another of the many triumphs of organized effort. The ruling probably would not yet be made—in fact the matter might never have been brought before a competent tribunal—had there been no organization among the people interested in securing it. But, fortunately, some good strong organizations were on the job, as shown by the following letter, received while the hearing was in progress, from President Sykes of the Corn Belt Meat Producers' Association:

To the American Breeder:—The hearing before the Interstate Commerce Commission at Washington, D. C., on the proposed advance on stocker and feeder cattle and sheep, I think, was very satisfactory from the stockmen's viewpoint, as, at this hearing the oral arguments were made in the case and the case was submitted and closed for the consideration of the

A. SYKES,
President Corn Belt Meat Producers' Association.

commission. I took up the stockmen's side of the case and attempted to show to the commission how important the live stock and feeding industry is to the Middle West and how practically all other industries are affected by the prosperity of the live stock industry, and how very important it is that no increased burdens be placed upon this industry at the present time on account of the precarious conditions that have existed in the live stock industry for the last eighteen months.

J. H. Henderson, commerce counsel for the state of Iowa; Mr. Loomis, representing the St. Paul Exchange; Mr. Bell, representing the Sioux City Exchange; Mr. Stryker, representing the Omaha Live Stock Exchange, and Mr. Wilson of Kansas City, representing the Kansas City Live Stock Exchange, all took part in the arguments and spoke mostly from the legal phases of the question, and also presented other phases in which the commission was interested and which had a bearing on the case. These men all made good strong arguments in the case and we feel that on the whole the stockmen's interest was ably represented and defended, and I am not inclined to believe that the commission will permit any such wholesale advances in rates on stocker and feeder cattle and sheep as is proposed in this case.—A. Sykes, Des Moines county, Iowa.

What One Association Has Done.

Before going to Washington for the hearing which President Sykes describes in his letter above, he furnished us with the following summary of work in which his association had successfully looked after the interests of its members.:

Returned the stockman's pass to the shipper.

Improved the running time and service of stock trains.

Secured a reduction in the Iowa rates on live stock of 18½ per cent.

Secured a reduction in the Iowa rate on feeding sheep 25 to 50 per cent.

Secured a re-grouping of the freight rates on live stock from Iowa points to Chicago, which means a saving of $100,000 a year to farmers and stockmen.

Secured an improvement of conditions in the stock yards at Chicago.

Secured feeding-in-transit rates for Iowa shippers and feeders.

During the fall and winter of 1909 and 1910 much complaint was made by stockmen about the heavy "shrink" on cattle shipped to Chicago, the shippers complaining that their cattle would not drink enough water at the stock yards to take on anything of a fill. It was found the stockyards company was furnishing water from Bubbly creek, which is nothing but the sewage of South Chicago, and undertaking to purify it by chemicals. The matter was taken up and a change to lake water secured, reducing the "shrink" about 25 per cent, a saving to the stockmen of from $15 to $25 per car.

During the summer of 1910 the railroads demanded a general advance in rates in the Middle West, extending east to the seaboard. This association fought the advances in the most important case that has been before the people since the Dred Scott case. There was almost a continuous hearing before the commission from the latter part of August to the first of December, and the final arguments were made in January, resulting in a ruling adverse to the railroads by the commission. Had it not been for the association, the farmers of Iowa would not have been represented.

In addition to this, the Corn Belt Meat Producers' Association has been active in securing legislation favorable to farmers and stockmen, both before the Iowa legislature and the national Congress.

CATTLE ON GRASS.

This is the best news we can give to our readers. Green grass, be it ever so short, has greatly improved the live stock situation. There never was a time in American history when feed was higher and more difficult to obtain generally than during the past winter. The continued drought over the Southwestern country for several years, except New Mexico and Arizona, which fared better than common, was a starter of a scarcity of feed. Last year was a bad crop year generally, and especially for roughness.

Each severe experience serves to put the breeding business on a more stable basis. It is likely that most of the breeders have suffered severely for the want of feed and protection for their live stock and will not be caught again in the same condition. Heretofore one section of the country might be short of feed, but could be supplied from another more

favored part of the world.

All interested in producing more and better stock should get familiar with emergency crops. There was ample time last year, in most sections, to produce a fair crop of roughness where the early planted crops were seen to be almost failures, but one breeder usually depends on some other breeder for producing a surplus which would regulate the market value. It is usually better to have this feed produced on the owner's land if possible, or at least as near as possible to where it is to be fed, as transportation is expensive in moving bulky feed.

When the issue of the American Breeder reaches our readers practically every animal that can be turned into the pasture will be consuming green grass. The same animals, only a short time ago, were partaking of most any kind of feed that was available at an exorbitant price. Plain shock fodder, without any corn, has sold in many localities for $1.50 per shock.

Beef cattle breeders have noticed this shortage in feed more than owners of most other class of live stock. The past few years have not been favorable for the production of high-class beef cattle, but the tide is now changing. There will be a gradual increase in the demand for pure-bred beef cattle, both registered and common stockers. At every market the demand is noticeable among the farmers who are buying the stuff, and especially springers.

There is no boom among the producers of pure-bred beef cattle, as many of them seem to have given up hope, but those who have stayed with the good ones will surely receive just reward for their staying qualities.

ALONG THE QUARANTINE LINE.

A progressive breeder, living below the quarantine a few counties, wishes to purchase Northern pure bred cattle, but is afraid to do so, owing to the ticks. He is anxious to have the quarantine line moved below his farm and asks us to have other breeders explain the best method of doing this. This is a subject that should interest all breeders of pure bred cattle. There are sections in the South where the tick has been eliminated, but cattle taken from one of these districts into an infected section are liable to take the fever and die. If the quarantine could be gradually pushed farther south each year it would open up more territory for better cattle. If a united effort was put forth along the quarantine line it could be pushed farther south rapidly. We want our readers who have had experience on this subject to give us their ideas for publication, as they will be valuable to the cause of farming as well as cattle raising.

MULEFOOT HOG BREEDERS' MEETING.

The annual meeting of the American Mulefoot Hog Record Association was held in Columbus, O. John H. Dunlap of Williamsport, O., the largest breeder of this hog, was elected president; C. W. Burkett of Newburgh, N. Y., vice-president; H. C. Moore of Columbus, O., was elected secretary.

The object of this association is to encourage and extend the breeding and improvement of the Mulefoot hog; to assist the members and to safeguard their interests in every possible way; to gather and to furnish them with information that may be beneficial to them in the conduct of their business of raising and breeding these hogs; and to publish a record from time to time of the breed.

Members from a great many states are enrolled. This breed has been brought before the public largely by Mr. Dunlap, who has written about them and advertised them largely through the farm press.

Uses of Record Associations

Two Classes of Services Rendered Breeders By Their Official Organizations. Plans of One Registry for Educational Publicity. Present Outlook For Breeders of Beef Cattle.

Written for The American Breeder.
By Secretary R. W. Brown, American Galloway Cattle Breeders' Association.

THE purposes of a pure-bred record association may be classified under two heads; record work and exploitation work. The first comes first in importance. It has to do with the preservation of the purity of a breed. It stands for improvement. The success of those engaged in animal husbandry, whether producing meat for food, beasts of burden for the trade or pure-bred animals for breeding purposes, is dependent more or less upon a pedigree record. The sphere of work of the pure-bred record associations is coordinate with that of the experiment station, the state fair or the farm journal. These associations furnish the elementary knowledge from which improvement comes, and were we to abandon registration even for a short period of time our improved stock would soon degenerate into "scrubs."

The need of registration becomes more and more apparent as our studs, herds and flocks increase in number. It is obvious also that the work becomes more and more complicated with each additional pedigree. In view of these facts record associations should spare no expense toward maintaining permanent and efficient systems of registration. Recognizing the importance and permanency of our work, the American Galloway Breeders' Association two years ago started a revision of its entire registration system, and we expect soon to have it as nearly up to date as it is possible to make it.

With our inside reorganization plans well under way, our attention is now being given to outside organization. Under our present charter all annual meetings, meetings of the board of directors, executive committee meetings, etc., must be held in the office of the association. This restricts somewhat the beneficial influence that comes from such meetings. At our last annual meeting a committee was appointed to draw up a reorganization plan which will empower us to hold our annual meetings alternately in different sections of the country. The plan will be submitted for adoption at our next meeting, and there is every reason to believe that it will effect a closer relationship between breeders in all sections of the country and between the association and its members.

The exploitation work of record associations is confined largely to the offering of special premiums at state fairs and live stock shows. There is no way of estimating the value of such work in so far as it applies to the development of an approved type, but the history of beef production in the United States in recent years teaches us that there is need of supplementing our show work with something else. The state fair or live stock show creates a desire for better stock, but there is lacking information to show the economic value of the animals exhibited. Experiment stations and agricultural journals are supplying this information to a large extent, but there is also need of educational work on the part of our record associations. Cheap advertising will not do. Breeders must have an appreciation of the permanency of their work, and through their record associations seek to establish those practices that stand for solidity. Publicity along educational lines is needed more than anything else, and this is what our association has in view.

There was never a time in the history of animal husbandry when the pure-bred beef cattle industry presented such golden opportunities as right now. Some of the greatest fortunes made in connection with the development of our American agriculture were made by beef producers on a free range. True, it was the free range that made these fortunes possibl, but the beef animal was chosen because he of all animals could make the best use of the cheaper feeds that the ranges produced. We no longer have free pastures, but there is more cheap feed going to waste cn our farms than was ever produced on the range, and it is for the utilization of this rough feed that we need a greater number of beef-producing herds on our farms. We are no longer living in a day and age of cheap beef, and the corn belt farmer under an intensive system of farm practice can produce this meat more profitably than the range man could ten years ago. It is foolish to say that land values are too high. British farmers produce beef on land for which they pay a yearly rental of $20.00 per acre, and the day is fast coming when beef will command as high a price in this country as in Great Britain. A system of crop rotation, which includes pasturage for a herd of beef cows, will in a ten-year period produce more grain from a given number of acres than these same acres can ever produce under a straight grain-raising policy

A FAMOUS OLD COUNTRY GALLOWAY ON HIS NATIVE HEATH.

Demonstration of this fact is found in the various practices of farmers in all sections of the country. Systems of agriculture that combine animal husbandry with the growing of food and fibrous plants are the only systems that stand for a permanent agriculture and for maximum production at minimum cost. It is up to us to feed and clothe an ever-increasing population, and this means that we must put into practice more intensive forms of agriculture. There will always be a place for every kind of live stock, but we must learn to select our breeding animals with the same care and intelligence with which we select our seed for grain crops. The "scrub" must go; the pure-bred animal must take its place, and the associations that stand for purity in breeding must always have an important part in the development of a permanent agriculture.

BIG THING IN STOCKMEN'S CO-OPERATION.

Plans for the organization of a Texas Cattle Raisers' Sales Directing Agency, with headquarters in Fort Worth, of which so much has been heard but which so few fully understood, were detailed in the annual address of Ed. C. Lasater of Falfurrias, president of the Texas Cattle Raisers' Association.

Mr. Lasater said in part:

"The objects to be accomplished by the establishment of the sales directing agency are the elimination of waste from the farm to the consumer and the confining of the returns of the middle man to earned toll. With your permission, I will read a short prospectus of this sales directing agency: Style of concern, Texas Cattle Raisers' Sales Directing Agency. Capital, $3,000,000. Object of the Texas cattle raisers' sales directing agency: The directing of the marketing of cattle, sheep and hogs, and the loaning of money upon chattel mortgage with live stock as security. Capital required to be raised as follows: $1,500,000 to be subscribed by the members of the Cattle Raisers' Association of Texas, this being at the rate of $1 per head on cattle rendered to the association: $1,500,000 to be subscribed by other interested parties. After its organization it would be controlled by its stockholders, but the election of directors and officers of said agency would be subject to confirmation by the Cattle Raisers' Association of Texas, acting through its executive committee. The chief office of the Cattle Raisers' Sales Directing Agency would be at Fort Worth, Tex., with branch offices at Kansas City, St. Louis and Oklahoma City.—Ft. Worth Live Stock Reporter.

BLOAT IN CATTLE.

To the American Breeder: Bloating is a very common trouble among cattle in the spring and summer. It is caused by the animals eating large quantities of greed food, which ferments and often proves fatal if not promptly attended to. Alfalfa is especially conducive to bloating when covered with dew.

The symptoms of bloating are familiar to the experienced farmer. One or more of the cattle act restless and move from one place to another as if in pain. The breathing is labored and rapid, and in a short time the characteristic distension of the abdomen is noted. In acute cases death may ensue in from ten to thirty minutes from suffocation or apoplexy.

Prompt treatment is usually necessary, and often the animal dies before a veterinarian can be summoned. To be prepared for such emergencies should be the aim of every stock owner.

Treatment consists in stopping the fermentation and formation of gas. All sorts of medicinal agents are used. Common baking soda, a tablespoonful

to a pint of water or three or four tablespoonfuls turpentine in a pint of water, given as a drench, is good. Mechanical appliances, such as the old-fashioned straw bridle or probang, are still used.

A trocar should be kept on hand and the animal punctured on the left side a hand's breadth in front of the point of the hip, about four inches back of the last rib, and the same distance below the backbone. If a knife is used, make a small incision and hold the aperture open until the gas escapes. Do not wait until the animal is almost dead before trocaring, but experience will only teach one the proper time if at all needed. Horses are trocared on the right side at about the same location. Greater precautions must be used on horses than on cattle or peritonitis will result.—Dr. E. T. Baker, Veterinarian, Idaho Experiment station.

EACH HAS ITS PLACE.

We now have an authentic report on the value of kafir corn for ensilage. Prof. O. E. Reed, head of the dairy department of the Kansas Agricultural College, referring to a careful test made last year, says that kafir corn silage proved to be better than silage made from sorghum, but not as good as silage made from Indian corn.

There are two important deductions to be made from the results of this test: One is that the silo, excellent as it is, is not an agent of alchemy—it does not make something from nothing, and it cannot add to ensilage elements not possessed by the material used in filling the silo. Where the land and the locality are suitable for producing good crops of Indian corn that crop should always be first choice as a silo filler. On the other hand, there are many farms which, either on account of soil or the climate, can not produce with economy and with certainty full crops of Indian corn. It is important to the owners of all such farms to know the excellent results which have been gotten from Kafir corn silage.

There is still another situation in which this knowledge comes into important play. In the big wheat growing areas of Kansas and further south, there is hardly a season in which an early variety of Kafir corn, planted immediately after wheat harvest, would not fail to reach a stage suitable for ensilage making, while the chances for its becoming sufficiently matured to make good fodder and grain in the ordinary way are much smaller. Herein lies, perhaps, the largest possibility for building up the live stock business in what we now know as wheat growing territory.

The putting of sorghum in third place in this test for ensilage should not be allowed to result in the elimination of this important crop. Those who have grown sorghum hay and learned how to feed it, especially those living on farms more or less spotted with thin land, have found it an important help, even where corn fodder, clover hay, and the grasses are reasonably abundant. Sorghum handled with the care which other forage crops require, and fed out before the freezing and thawing of late winter or early spring have started fermentation of its sugar content, will do well its part in the wintering of the average quota of farm stock. Men who have studied its use make a practice of using their sorghum hay first of all their roughage, mixing with it just enough of other feeds to give the variety necessary for appetite and health. As either Indian corn or Kafir can be grown where sorghum can, it is probable that making ensilage of sorghum should seldom, if ever, be advised. But used as hay, properly grown and cured, it will play an important part in the feed crops of the farm.

A serious pest in the South is the crayfish; carbon bisulphid is a sure remedy.—From the 1911 report of the United States Secretary of Agriculture.

Handling a Milk Fever Case

Discussion of Parturition Condition and Treatments for Milk Fever Adapted to the Average Farm. Cautions as to Care of Cow.

Written for The American Breeder,
By W. R. Gilbert, V.S., Calgary, Alta., Canada.

THE use of ergot in cleansing drenches is for the stimulation of the womb to contract, and the student should know that such contraction is the normal physiological process, and that delay is inimical to milk production and early restoration to renewed fertility. The opportunity should be taken of examining the thin and light material of which the maiden uterus is composed, and a comparison made with the great mass to which it attains when a cow dies at the time of parturition. It does not remain at that great size when the animal is again impregnated, but has an interval during which much of its substance is converted for other uses, milk making among them.

Superflous accumulations of fat in the bodies of suckling mothers is utilized for milk making, and most pig breeders like to see a sow in pretty good condition before farrowing, as they know how she will melt away when the pigs begin to pull on her. Among cattlemen there are two separate schools—the one holding the view that a high condition is favorable, the other believing in only store condition. There is, of course, something to be said for those who entertain extreme views, and the truth probably lies in the middle. Fat animals are less easily induced to breed or become pregnant. Of that most are agreed. That they are more liable to inflammatory diseases if anything goes wrong is probable, but given good luck at parturition time they will do themselves and their progeny better; while the poor beast will expend all her energies in milk production and remain poor, and if she fails to conceive there is nothing but a frame on which to build a fat cow, worth scarcely anything more than the food she will have consumed.

Breeders I have known, and who had suffered losses by milk fever, would get their cows as fat as they could, and if the animals dropped after calving would give no medicine, but slaughter and dress for market, as they held that that was the best way to cut losses. Perhaps it was then. I have eaten many a bit of meat so killed, and deemed it fit for food, though not equal to a fatted steer or prime heifer. I have a letter before me written by the late Dr. Fleming, author of "Veterinary Obstetrics," in which he says (March 28, 1886): "I am still of the opinion that in parturient apoplexy, provided the animal has not been drugged, and has been well bled in killing, the flesh is perfectly fit for human food."

The years that have elapsed since that was written have brought about a great change in the general views of what is and is not fit for food, and whatever opinion the individual veterinary may have now, he will fear to certify such a carcass if it dresses ever so well. Milk fever was then believed to be apoplexy, or pressure of blood on the neck portion of the spinal cord. A specimen in a bottle used to be handed round to the students, in proof, by the most eminent of cattle pathologists. It was bad form for a student to speak of "milk fever," because the clinical thermometer, then a new toy, proved that increase of temperature was quite unusual, and that more often than not the temperature was subnormal.

Cause of Milk Fever.

It is now supposed that milk fever is due to something developed in the udder, some elusive toxin which has not been identified, but appears to be neutralized by oxygen brought into direct contact. A Danish veterinary surgeon, Schmidt of Kolding, was the first to succeed with injections of iodide of potassium; then antiseptics were found useful, air pumped through a sterilizing medium (or without it, as I can personally testify), or, perhaps better than all, oxygen itself, forced into the glands and retained by clips. These all have proved by the great number of recoveries that whatever this subtle self-developed poison consists of it can be neutralized.

Having regard to the conditions under which oxygen is employed, the apparatus required, and the probable delay in obtaining it and using it, by persons not specially skilled in the manipulation of scientific instruments, and further the very large, perhaps equally large, measure of success which attends the simpler plan of injecting solutions, these latter may, with confidence, be recommended to the every-day cow keeper of no more than ordinary skill. A $2 or $3 outfit is all that he needs, and this will serve him on many other occasions if scrupulous about cleanliness and care of the instrument. A bottle containing six drams of iodide of potassium, half a dram of chinosol, an ounce of glycerine, and made up to half a pint with water, may be put away in a dark cupboard or wrapped in blue paper, and will keep almost indefinitely. When wanted it can be mixed with three half pints of warm water and half a pint injected into each quarter.

To prepare the instrument, it should be immersed in the basin containing the mixture, and the latter should be passed through the syringe. The nozzle should be introduced carefully and not pushed too far. When the amount of fluid has gone in the syringe will be a fairly safe conduit for air which can be pumped in without withdrawing and until quarter is blown up. When removed the teat should be pressed and the bag massaged with the object of spreading both the fluid and the air.

Objection is, of course, made to the impurity of the air of the ordinary cow stable, but as a matter of practical experience I have never found any bad consequences, because whatever impurities may have been carried in they have found themselves in circumstances in which they apparently could not live. It is not as the best possible plan of treatment that I recommend this now aging method, but taking it all round, as the most successful and safe in the hands of non-professional men. The prospective small holder can afford the outlay and employ the remedy whether he has sent for a veterinary surgeon or not. Time is of such great importance in milk fever, and a practitioner has to cover such a big country to make a small living that he may not be available for many hours.

Use Care With the Cow.

While the remedy introduced into the udder is doing its work we should not neglect other matters, but keep the cow's head from falling into a bad position. Hoist her up with bundles of straw, or anything that comes handy, stuffed into sacks. The surface should be kept warm with rugs, and the legs rubbed from time to time; not allowing a cramp position at any time. Cold swabs to the head and a warm flatiron over the loin from time to time is, I think helpful. We should empty the rectum by hand, and if we find any disposition to hardness introduce half a pound of neat glycerine, leaving it there to do its work. If consciousness does return in six hours the dose may be repeated.

Some of my farming friends have been too successful, so to speak; they have given the udder treatment with success, and become too cock sure, neglecting other matters which help to restore circulation, which it should be understood is affected as by a narcotic poison, and if not restored within a reasonable time the cow's return to sensibility and perhaps capacity to rise is followed by congestion of the lungs, from which the animal dies. As soon as sensible, and the risk of giving medicine the wrong way has passed, large quantities of strong black coffee should be given, and they are none the worse for a "wee drappie of mountain dew" or other spirit. In deference to total abstainers, and on farms where no alcohol was obtainable, I have given carbonate of ammonia, but have not found it comparable to whisky for this purpose.

A cow should not be despaired of if she goes down a second time. Thirty years ago, before the new treatment was heard of, I saw the same cow twice which was said to be on her side, and would be dead before I could get there (four miles). Each time she was up and chewing her cud on my arrival. She bore several calves afterward, and had no further attack.

IMPROVING YOUNG BEFORE BIRTH.

(Continued from page 4.)

low the first three beef breeds. In swine the writer has observed the following:

Yearling Sows	Ave. Wt. Litter	Wt. Pig	*Ave. Daily Gain
Up to 235 lbs., incl.	14.54	2.4	.48
Over 235 lbs.	16.46	2.4	.483
Two-year-old sows—			
Up to 290 lbs., incl.	21.0	2.5	.563
Over 290 lbs.	29.1	2.8	.626

*After weaning for 4 weeks.

This would show a result in favor of the larger sows at both ages. In cattle, however, a different conclusion was arrived at when the weight depended not on size of frame, but fleshiness. Here it was found that calves from Shorthorns over 1,800 pounds were either of similar weight to the calves from the 1,800-pound cows (approximate) or actually even lighter.

A much mooted question has been that of the best way to increase the size of the herd through the male or females. There is apparently nothing on the subject in connection with beef cattle but the conclusions one can draw from the following work, should unquestionably apply to cattle as well as sheep. The authorities are quoted at the close of each conclusion:

1. The heavier the ewe the heavier the lamb, almost directly proportional.—(University of Missouri; University of Wisconsin).

2. The ram has little or no influence on weight of lamb. Average weight two heaviest rams, 237 pounds; their lambs at birth, 8.16 pounds. Average weight two lightest rams, 142 pounds; their lambs at birth, 8.02 pounds.—(Missouri).

3. Small ewes produce largest per cent of single lambs, large ewes largest per cent twins or better.—(Wisconsin).

These factors show that the female is the most effective of the two sexes on weight at birth, and furthermore that size is correlated with fertility. In addition to this point in favor of the large mother, the study of the Jersey cows that were members of the winning herd at the St. Louis exposition shows that large cows are better milkers (within the breed) and consequently nourish their offspring better.

Further confirmatory of the fact that the large females are better mothers, an examination of the daily gains of the lambs from large ewes shows clearly that all evidence favors the large dam and size in the young at birth. The Missouri experiment station concludes that "large lambs (9 pounds and over) gained over 2 pounds weekly and smaller lambs less. They also were earlier maturing and larger when grown."

J. I. Falconer, a 1909 graduate of

the New Hampshire Agricultural college, presents the following table, still favoring the larger young:

Lot 1. Birth Wt.	No. Lambs	Av. Wk'ly Gain
Below 8 lbs.....	14	2.73
8 to 10 lbs.....	25	2.96
10 to 12 lbs.....	11	3.19
12 lbs. up.....	0	0
Lot 2. Birth Wt.	**No. Lambs**	**Av. Wk'ly Gain**
Below 8 lbs.....	0	0
8 to 10 lbs.....	8	3.55
10 to 12 lbs.....	8	4.04
12 lbs. up.....	4	4.29

The writer trusts that these points brought forth drive home the conclusion that the larger the ewe the larger the lamb—the larger the lamb, the greater the gain—and finally as a result of these the larger the mature animal. Without a doubt these conclusions apply (within reasonable bounds) to cattle as well as to sheep and swine, so that one may safely say that the most satisfactory way to increase the size of the individuals in the herd is through the females.

Other Factors.

Sex and length of the gestation period are sometimes assumed to influence the size of the offspring. From published conclusions on cattle sheep and swine it seems that the length of gestation has no influence on size. Sex apparently may cause a variation in birth weight. In a medical publication the writer recently saw a table giving an advantage in weight of .4 of a pound to boy babies. Wisconsin reports ram lambs for five years at 8.3 pounds and ewe lambs 7.8 pounds; Missouri claims 16 per cent more weight for male lambs, a prominent Percheron breeder claims 8 pounds for male foals, and the results so far of this year's farrowing list at the Iowa station shows .2 of a pound advantage to the boar pig. With all of these variations in other animals it is not improbable that cattle vary also in the same direction.

The number of offspring at a single birth affects size adversely. Missouri reports twin lambs as .5 of a pound lighter than singles; Iowa records show 20 pounds for the single calf over the twin. Averages from numerous cases show a deduction in individual weight of .1 of a pound on each pig for all over seven in the litter, and twin humans are 2.2 pounds lighter on the average than single babies.

It is not absolute that these factors bring individual results, but from the statistics and material available, the conclusions in terms of averages seem justifiable. In beef cattle so much money is involved in a single animal that any measure the breeder may take to increase his returns is a distinct advance over ordinary farm practice.

Indiana Cattle Feeders Meet

Report on the Purdue University Experiment in Using Silage to Fatten Cattle, Which the Cattle Feeders Assembled to Study. Important Variation in Profit Figures.

To the American Breeder:—The great interest in cattle feeding and especially in the experimental work at Purdue is attested to by the presence of more than 350 enthusiastic feeders at the fifth annual spring meeting of the Indiana Cattle Feeders' Association. The spring meeting was held to allow the visiting feeders to inspect the experimental cattle at Purdue after they had been fattened for the market.

The results of the feeding trial, which has been completed, were discussed by F. G. King, associate in animal husbandry. The cattle used in the trial were choice feeders, purchased on the market and cost in the feed lot $5.55 per cwt. They had been fed for 160 days on grain rations of shelled corn and cotton seed meal. The roughage of the different lots consisted of clover hay and oat straw in connection with corn silage. During the feeding trial the value of the cattle as a whole increased $3.20 per cwt. and returned profits varying from $8.24 to $26.21 per head. The selling value of these cattle is the highest ever received at Purdue for an entire drove of experimental cattle. The lot of cattle producing the greatest profit were fed shelled corn, cotton seed meal and corn silage. These cattle gained 2.52 pounds daily per head at a cost of $9.88 per cwt. According to Messrs. J. T. Alexander and Allen Beeler, who placed values on all lots of cattle these steers were worth on the Chicago market $8.75 per cwt. After deducting 40 cents per hundred pounds for shipping the cattle returned a profit of $26.21 per head.

The second lot in point of profit was fed shelled corn, cotton seed meal, silage twice daily, and oat straw. The rate of gain was 2.40 pounds daily per head, and cost of gain was $10.16. Selling value was $8.65 per cwt. in Chicago and the profit was $24.54.

The lot of cattle ranking third in profit received silage, oat straw and cotton seed meal for 60 days, and from that time forward, received a full feed of corn in addition. Their rate of gain was 2.20 daily per head at a cost of $9.50 per cwt. With a value of $8.50 per cwt. in Chicago, or $8.10 in the lots their returns as profit were $24.16 per head.

The lot of cattle ranking fourth was fed shelled corn, cotton seed meal, oat straw once daily, and corn silage once daily. With a rate of gain of 2:16 pounds daily per head, and a cost of gain of $11.27 per cwt. and a selling value of $8.10 per cwt. in the lot, this lot of cattle returned a profit of $19.86 per head. A lot of cattle fed shelled corn, cotton seed meal, silage twice daily and clover hay, ranked fifth with a daily gain of 2.32 pounds per head and a cost of gain of $11.06 per cwt. The profit in this lot was $19.43 per head. A lot of cattle fed shelled corn, cotton seed meal, corn silage once daily and clover hay once daily returned a profit of $17.07 per head, while the lot fed shelled corn, cotton seed meal and clover hay returned a profit of $8.24.

The most important matter brought out by the trial was the remarkable efficiency of the corn silage as compared to the clover hay for fattening cattle. The exceedingly large difference between profits of the lots was due largely to the price of clover hay, which was valued at $20 per ton.

AT THE INDIANA CATTLE FEEDERS MEETING.
F. G. King Giving Results of the Steer Feeding Experiment Which Had Just Closed.

At a business session a resolution in favor of conducting a cattle and hog train in Indiana, and another enlarging the policy of the association were adopted. Favorable action on a resolution asking railroads for better rates on limestone for fertilizer was taken. The principal feature of the session was an address by Mr. John Clay of Chicago on "The Passing of the Range and Our Supply of Young Cattle." He pointed out that the movement of feeder cattle in 1912 had decreased 18 per cent from the five-year average, and said: "Never before has it been so difficult to pick up in the corn belt states young cattle for either grazing or feed lot use. Prospective buyers are forced to buy them at the larger markets. This brings them in direct competition with the packers, who need such kinds for cheap beef. This in no small measure has contributed to depleting the stock of cows and heifers available for beef in most parts of the Middle West and East to such an extent that packers have been forced to draw heavily upon the young steers that normally and properly belong in the feed lots.

"This shortage," he said, "is shown by the fact that pastures in the Southwest have been receiving cattle from markets as far East as Chicago at a time when the average price of stocker and feeder cattle at Chicago the first four months of 1912 was around $5.35, the highest ever known, and 60 cents per cwt. higher than the five-year average."

The long looked for shortage of beef which has now arrived must be met, according to Mr. Clay, by better methods of government supervision of public lands in the range country. Under such administration of the public lands, whereby settlers may secure long time leases upon these lands, the production of feeder cattle would be stimulated so that in a few years our supply would reach normal again. In absence of such beneficial public land legislation, however, the burden of supply falls upon the men in the feeding land of the country, the corn belt, who will, under the stimulation of high prices, establish breeding herds and raise their own calves for the feed lot. This method of production is inevitable under existing conditions.—F. G. King, secretary Indiana Cattle Feeders' Association.

SUMMARY OF CATTLE FEEDING AT PURDUE UNIVERSITY EXPERIMENT STATION, WINTER 1911- 1912. (160 DAYS.)

	Lot 1.	Lot 2.	Lot 3.	Lot 4.	Lot 5.	Lot 6.	Lot 7.
Initial value, Nov. 17, '11	$5.55	$5.55	$5.55	$5.55	$5.55	$5.55	$5.55
Initial weight, Nov. 17, '11	9,653	9,660	9,687	9,637	9,680	9,687	9,642
Final weight, April 25, '12	13,398	13,460	13,720	13,353	13,135	13,530	13,160
Total gain	3,745	3,800	4,033	3,716	3,455	3,843	3,518
Average daily gain	2.34	2.375	2.52	2.32	2.16	2.40	2.20
Total feed consumed:							
Shelled corn	24,645	28,605	23,570	21,885	23,900	22,200	14,255
Cottonseed meal	4,401	4,437	4,562.5	4,452.5	4,331	4,467.5	4,060
Clover hay	9,298	17,848	.....	4,071	.....	.....	.....
Oat straw	.....	.....	.....	.....	6,740	3,695	5,550
Corn silage	25,650	.....	43,810	39,664	25,550	40,410	47,750
Daily feed per steer:							
Shelled corn	15.40	17.88	14.73	13.68	14.94	13.88	8.91
Cottonseed meal	2.75	2.77	2.85	2.78	2.71	2.79	2.54
Clover hay	5.81	11.16	.....	2.54	.....	.....	.....
Oat straw	.....	.....	.....	.....	4.21	2.31	3.47
Corn silage	16.03	.....	27.38	24.79	15.97	25.26	29.84
Cost of grain, per cwt., 1	$12.40	$14.23	$9.88	$11.06	$11.27	$10.16	$9.50
2	11.61	13.05	9.61	10.52	10.89	9.80	9.00
3	10.99	11.88	.....	10.24	10.70	9.70	8.85
Necessary selling price, 1	7.47	8.00	6.82	7.08	7.05	6.86	6.61
2	7.24	7.67	6.74	6.93	6.96	6.76	6.47
3	7.07	7.34	.....	6.86	6.90	6.73	6.43
Actual selling price (Chicago price, less 40c.)	8.25	8.25	8.35	8.10	8.10	8.25	8.10
Profit per steer:							
Including pork	17.07	8.24	26.21	19.43	19.86	24.54	24.16
Not including pork	10.49	3.37	20.96	13.59	13.73	18.84	19.66
	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.
Pork produced from droppings	1,128	907	957	1,033	1,070	1,015	880
Corn fed to hogs in lots	2,096	2,096	2,096	2,096	2,096	2,096	2,244

These figures are based upon the following prices for feeds: Shelled corn, first month, 51.7c; second month, 51.7c; third month, 57.1c; fourth month, 58.5c; fifth month, 64.2c; last ten days, 71.2c; cottonseed meal, $29.00 per ton.

1. Clover hay, $20.00 per ton; oat straw, $8.00 per ton; corn silage, $4.00 per ton.
2. Clover hay, $15.00 per ton; oat straw, $6.00 per ton; corn silage, $3.50 per ton.
3. Clover hay, $10.00 per ton; oat straw, $4.00 per ton; corn silage, $3.50 per ton.

THE AD PAID HIM.

To The American Breeder: Does advertising pay? Well, I guess yes. By inserting two one-inch ads in The American Breeder I was sucessful in selling several of my Percherons. On March 7 I sold Mr. Adams of Udall, the 2-year-old stallion, Model 68354, weighing 2,060 pounds; a better individual was never taken from the Sumner County Stock Farm. On March 20, I sold to Mr. A. M. Ewbank of Cherokee, Oklahoma, the yearling black Percheron stallion, Superior 77288. Mr. Ewbank being a lover and breeder of the Percherons, certainly knew a good yearling when he made his selection. He is one of the most enterprising stock men of Alfalfa County, Oklahoma, and will be pleased to show his purchase to any interested parties, as he spent considerable time and money among the several breeders before he found one that he wanted to place at the head of his herd.—John A. Spohr, Sumner County, Kansas.

There is great promise in the fact that whole classes of graduates of agricultural colleges go back to the farms, having learned how to make them profitable.—From the 1911 report of the United States Secretary of Agriculture.

THE AMERICAN BREEDER

With which is combined
THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE
Editors.

Published semi-monthly (on the 5th and 20th of each month) by the
GRAHAM PUBLISHING COMPANY,
INCORPORATED.
225 WEST TWELFTH STREET.
Kansas City, Mo.
BELL TELEPHONE, 4297 GRAND.

All communications for this paper should be addressed to the American Breeder, or the Graham Publishing Company, and not to individuals.

Advertising Rates On Application.

Subscription Rates.

To all points in the United States and Mexico, per annum, 50c; 3 years, $1, payable in advance.

To all points in Canada, per annum, in advance, 75c.

To all foreign points (in the International Postal Union), per annum, in advance (6 francs, 5 shillings), or $1.15.

When sending subscriptions, please state whether they are renewals or new ones. Always renew under the same name and initials as previously used, and at least two weeks before your present subscription expires, so that you will not miss any number. When changing your postoffice address, state the old address as well as the new one.

Watch the wrappers on your paper. The month before your subscription expires they are stamped "your subscription expires with next issue," and on the following edition is stamped "your subscription expires with this issue." When the time for which the AMERICAN BREEDER is ordered has expired, it is always discontinued.

If you miss your paper please notify us at once and all lost copies will be replaced.

Entered as second class matter, November 23, 1911, at the postoffice at Kansas City, Mo., under the act of March 3, 1879.

Copyright, 1912, by the Graham Publishing Co.

All persons are warned not to reprint any part of this paper during 1912, without giving full credit for the same to the American Breeder, Kansas City, Mo.

SHIPPING LIVE STOCK.

The present conditions under which breeding animals must be shipped are doing much to retard the use of better stock. The improvement of live stock on our farms is brought about largely by the use of better sires. The average farmer when buying improved live stock usually purchases one sire at a time. The rate for shipping one male animal is very expensive when it is shipped alone. A prominent breeder who recently shipped two bulls on separate orders to Oregon from Kansas City found that he could have shipped a whole car load of animals for less money over the same route. This heavy expense falls entirely on the producers of improved stock, as the scrubs are not often shipped a great distance owing to their limited value.

The breeders of pure-bred stock can only expect relief from these exorbitant prices through organization, and the best organizations to be formed for their protection are county breeders' organizations in every county where pure-bred live stock is produced.

The rules of some railroads require that live stock in transit must be accompanied by a caretaker. Unless the railroad company receives pay for a car lot shipment, the caretaker, as a rule, must buy a first-class ticket in order to accompany the animals. The rules of the railroads in this regard vary somewhat, and this has lead to confusion, in addition to the expense. There certainly should be some uniform regulations regarding this feature in the shipping of improved live stock intended for breeding purposes. Organizations of shippers and live stock commission men have given their attention to railroad rates and regulations bearing on the shipping of live stock intended for slaughter or feeding purposes, but there has not yet been sufficient organization among the breeders to secure equally good conditions for their business.

We contend that all live stock of recognized registration should be transported at half the rates charged for other stock. If this subject is properly presented before congress and there are enough well-organized county breeders' organizations to back up a demand for better conditions a change may be had. Canada has regulated the shipment of pure-bred stock to the extent of securing its transportation at half the price of other stock.

The mail order business in breeding animals can be greatly enlarged in all pure-bred live stock except the equines if lower rates could be had without requiring an attendant to accompany the stock.

MATTERS MEANT TO BE UNDERSTOOD.

Everyone interested in the production of live stock should be interested in the fertility of their own breeding animals. We hope all our readers will read and study every article in this paper on this subject, whether it should be horses or cattle.

The two classes of live stock are very similar in many ways, and a study of one will suggest substantial material for improved methods in either class of stock.

While fertilization in the mare usually takes place in the fallopian tubes, and the nucleus is formed in the horns of the uterus in the cow, yet this should not cause the breeders of either class of stock to be less interested in these articles. The cow is less subject to infection of certain types in the genital tract than the mare, while the cow is more liable to other infections in the same region.

The study of this subject has been neglected, and many animals of our best blood and type have been sacrificed, for the want of information on this subject. We hope our many readers will pardon the plain language used in discussing these subjects, but it is necessary for accuracy that we use plain terms and go into such detail as to be easily understood by all readers. We again request all our readers not to think these subjects are too deep for the average breeder, for we will do our utmost to make them as plain as possible. Some of these articles have required months of hard labor, and a large expenditure of money in the preparation, and we hope our readers will appreciate our efforts.

It is not our intention to print a lot of worthless material, but to try and condense the information so that it may be easily applied. Some of the more important articles we print could be read several times to an advantage.

Some of our readers have asked questions on subjects which have been thoroughly covered in former issues. A lot of valuable information can be laid away for reference which will be of value to every breeder for life, but we will cheerfully reprint the essential points of any such article that may be called for.

BREEDING HEIFERS.

A young Oklahoma breeder has purchased a number of registered Shorthorn yearling heifers and wishes to know at what time would be the most suitable to breed these heifers. The Hereford Association has ruled that a calf can not be registered out of a heifer less than 27 months of age. We believe this is a good rule, and 30 months might be better. Most heifers when bred too young have more or less difficulty in delivering the calf. This frequently impairs the generative tract to the extent that they are not easily gotten with calf again that season. If a heifer can have a few weeks on grass before her time is up she is more liable to have an easy delivery than if fed dry feed. If a cow is an extreme milker and the calf should be able to consume the greater portion of the milk, it is difficult to get the required growth while the calf is nursing. Shorthorn cows, to be in demand, must have a considerable growth, and many of them are extra good milkers. Unless the Oklahoma breeder has better than the average pasture in his state, it would be better to build a good frame before the heifers are fresh, unless he is supplied with some other feed.

PROGRESSIVE HORSE BREEDERS.

Nearly every mail brings us this inquiry: "Can the average man be successful with the Capsule System?" If the stallion or jack discharges live spermatozoa and the operator will observe a few rules the average breeder can be successful with the Capsule System. And the great wonder is that even more of the breeders are not taking hold of this wonderful proposition.

Occasionally a breeder believes that we are working to his disadavantage in advocating the Capsule System. This is not true with any progressive man. We are showing where it is possible to dispose of an inferior animal and purchase an individual good enough to command the best and principal part of the patronage in an average breeding district. If one stallion or one jack can do as much service with modern methods as a whole barn full of inferior stock, and make more money with less work, less capital, less feed, less risk and a more satisfactory business, are we working to the diadvantage of the progressive breeders?

This is really, also, an advantage to mare owners. A certain hour can be advertised when all mare owners know that they can get their mares bred at that particular time without making any date. They can patronize a better sire for less money. If six mares are bred at one service for a fee of $10 each, how can an inferior animal meet this competition? This is the problem that every breeder who expects to remain in the business must consider seriously.

One successful breeder who is in competition with a lot of inferior horses has cut the price to $10 to insure the colt to stand and suck for thirty days. He will breed this year nearly 600 mares, and he should get at least three-fourths of them in foal. Is this not a good profit on the investment of any stallion? This is no boy's talk; this is actual experience; this is the change that is taking place in scientific horse breeding.

The question is frequently asked whether colts are as good from the Capsule System. It is not necessary to make more than one service a day to breed all the mares in a community. The spermatozoa is always stronger from a stallion or jack when he is not used to excess; the colt comes in better condition. Many of the weak colts are the result of the stallion or jack doing too much service. Some say that the mare owners will not allow the use of capsules. This is all imagination. The writer has made public demonstrations all over the Corn Belt, and never has found one that would refuse to accept the Capsule System.

ADVERTISING SADDLE HORSES.

The American saddle horse is a home product and only known extensively in half a dozen states. Gen. John B. Castleman did the saddle horse breeders much service by exhibiting his great saddle mare at the leading state fairs some years ago. We believe the American Saddle Horse Breeders' Association could afford to pay the expense of sending a number of the leading stallions to the state fairs, where they could be exhibited daily in front of the grand stand between the races and at other points on the grounds where these beautiful animals could be inspected and admired. We believe there are a number of breeders who own valuable stallions who would be glad to send a rider with the consignment free of charge if the association would pay the traveling expenses. The stallions might also compete for prizes in their regular classes. Such a campaign should prove a profitable investment, as it would increase the interest in American saddle horses in sections where many individuals have not had an opportunity to see these excellent animals in motion. Many newspapers would be glad to give this feature publicity, which would aid both the individual stallions and the American Saddle Horse as a breed.

SOUTH AMERICAN BEEF.

Every few months for the past three or four years news dispatches have contained information relative to beef production in South America, which have naturally lead to the anticipated efforts toward placing South American beef on the free list. On account of the high cost of living in the cities of this country, there has been an enormous demand for the reduction of tariffs on food stuffs, and gigantic beef producing concerns on the Southern Continent are sure to be taking advantage of this movement in their campaign for the free admission of their products.

We lately gave a full account of the organization and proposed operation of the biggest company ever formed, the sole business of which is to be the production and merchandising of meats. Cattle and hogs are to be raised on a scale never before dreamed of in the history of the world, and packing and shipping facilities are included in the plan. It is expected that within a very few years the shipment of chilled beef and cured pork resulting from these activities in South America will become enormous, and if a free entrance to the markets of the United States can be secured meat producers of this country will feel the effects.

It is not believed that such a thing will ever be permitted, as this country has a problem, no less serious than the cost of food stuffs, in the maintainance of our soil fertility. The history of every country in the world that has maintained a respectable agriculture for any great length of time proves that this can be done only by keeping a good deal of live stock on the land. Live stock can not be kept on the land, and the best means of maintaining fertility thus secured, unless the stock growers are assured good prices for their products. To open our doors to a flood of meats produced on the free range of South American and the rich land secured for almost nothing and by the use of the cheapest labor to be found on the Western Hemisphere would be directly opposed to the interests of a much greater and more important class than the class which is now asking for relief from high prices in the cities.

The cities should be made to take care of their own problems. To a large extent the people living in the cities have gone there from choice. Thousands would be welcomed back to the land, where they could live better and more healthfully if they were willing to give up the artificial life and excitement of the city, and thousands whose early training made it possible for them to provide for themselves on the land have gone back to the life which they had deserted for a disappointing existence in town.

But this is away from the point. The agricultural classes of this country cannot afford to take any chances on a blunder in tariff making which will injure a business that directly safeguards the most fundamental part

of this country's wealth, and there is no surer way to guard against such mistaken action than to have organizations in every county of our farming districts ready to take united action on any public question. Without such organizations it is practically impossible to get an expression of the will of the farming and stock-growing population, excepting at election time. With such organizations congress can be made to feel at any time the sentiment of the people it represents. This is by no means the only important thing which such an organization can accomplish. It is not even the most important, but it is one thing which alone should justify the forming of county improved live stock breeders' associations wherever such organizations do not now exist

FALL FAIRS OF 1912.

The following list shows the opening dates of the leading fall fairs and live stock shows of 1912, as arranged by the American Association of Fairs and Expositions

Aug. 26—Iowa state fair, Des Moines.
Aug. 26—Ohio state fair, Columbus.
Sept. 2—Minnesota state fair, Hamline.
Sept. 2—Indiana state fair, Indianapolis.
Sept. 2—Nebraska state fair, Lincoln.
Sept. 2—California state fair, Sacramento.
Sept. 9—South Dakota state fair, Huron.
Sept. 9—Wisconsin state fair, Milwaukee.
Sept. 9—Kansas state fair, Topeka.
Sept. 9—West Michigan state fair, Grand Rapids.
Sept. 9—Oregon state fair, Salem.
Sept. 9—New York state fair, Syracuse.
Sept. 9—Colorado state fair and exposition, Denver.
Sept. 16—Interstate Live Stock Fair association, Sioux City, Ia.
Sept. 16—Central Kansas Fair Association, Hutchinson.
Sept. 16—Tennessee state fair, Nashville.
Sept. 16—Vermont state fair, White River Junction.
Sept. 16—Colorado state fair, Pueblo.
Sept. 23—Interstate Live Stock and Horse Show, St. Joseph, Mo.
Sept. 23—Tri-State fair, Memphis, Tenn.
Sept. 23—Montana state fair, Helena.
Sept 23—Oklahoma state fair, Oklahoma City.
Sept. 30—Interstate fair, Spokane, Wash.
Sept. 30—Missouri state fair, Sedalia.
Sept. 30—Utah state fair, Salt Lake City.
Sept. 30—Interstate fair, Trenton, N. J.
Oct. 7—American Royal Live Stock Show, Kansas City, Mo.
Oct. 7—Illinois state fair, Springfield.
Oct. 7—Muskogee Fair Association, Muskogee, Okla.
Oct. 14—Northwestern Live Stock Association, South St. Paul, Minn.
Oct. 14—Texas state fair, Dallas.
Oct. 28—Louisiana state Fair, Shreveport.

SORE SHOULDERS.

With horses going into heavy labor in very thin condition, many of them will not fill the collar as snug as in former years. This will necessarily create more sore shoulders and necks than commonly. The collar should fit up tight, so there will be no extra room between the collar and the neck. If a collar has been used it can frequently be buckled up a notch tighter to remove the slack. Keep the collar smooth by rubbing with the hand. Do not use a knife nor curry comb, as they leave the surface rough and irritates and causes sores. This should be done when the collar is removed, before the accumulation drys. Wash the shoulder or neck at night with cold water and remove all surplus hair and dirt so as to leave the surface smooth; then apply lime, sulphur and tannin in three equal parts. This is a powder. Rub it in thoroughly, as it heals and toughens the surface. There is little use to have sores if care is taken. With a late spring and weak horses, it behooves every one using horses to be as careful with them as possible.

THE BARN AND HOUSE FLIES.

Last year in the course of the most active "swat the fly campaign," somebody said that good housekeeping in the country must begin at the barn, and explained that fighting flies about the house was almost a hopeless task as long as manure piles at the barn nearby afforded the most favorable breeding place known for this pest.

While all sorts of degrees of fly prevention are possible, and even the least of them is desirable, there is no way to keep flies from breeding readily in warm weather, until accumulations of manure are removed daily and scattered thinly over the meadow or pasture, or the manure heaps covered with something which will keep flies away. In many localities a liberal sprinkling of lime over manure heaps will not only very largely check the breeding of flies, but will add to the value of the manure for that particular soil.

But the housekeeper is by no means the only one interested in keeping down the fly crop. It is equally important in the work of the man. Much of the difficulty in treating sickness and injury of live stock in the summer time comes from the work of the fly, carrying infection and annoying the patient. A great many of the better equipped stock barns are thoroughly screened, not only for animals out of condition, but for all work and breeding stock. And it is probable that the saving in feed alone will pay for such expense.

The place to begin, however, is, as indicated above, at the breeding place of the fly. While there are many other places in which flies propagate to some extent, a vast majority of the millions produced on every farm, hatch in the accumulations of stable manure, breeding most regularly in dark, out-of-the-way places where the sunlight never reaches.

EDUCATING MARE OWNERS.

A visit to any of the leading horse markets will convince the most skeptical that a large percentage of mares are being bred to inferior stallions. Much of the inferior stuff that is reaching the markets is not paying for its production. Most of it is being produced at a loss, while the better stock with quality and size never sold higher, and the demand is steadily increasing.

The horse stock of this country has not progressed as rapidly as other classes of farm animals. But this is not the most difficult proposition for the stallion and jack owner, as the mares are not producing as they should. Most mare owners are anxious to raise colts, but there are so many old fogy notions in horse breeding that must be eliminated before a good percentage of foals can be produced. Among these are retrying the mares every nine days, the double cover, breeding in the moon, the daylight service, breeding every day until the mare goes out of heat and—the most disastrous of all—breeding diseased mares.

There is just one easy way to overcome this difficulty, and the owner of every stallion or jack can easily do it with a little time: that is to have the mare owners read the American Breeder. Every stallion or jack owner should have at least ten or twenty of his leading customers reading the American Breeder all the time. A great many of the breeders have taken advantage of this opportunity. Some of them have sent us as high as a hundred subscriptions. It is not necessary for the agent to have a lot of sample copies to distribute. Just show the customer your paper and state that you would not take a dollar for it, and if he is not satisfied with the American Breeder that you will give him back his money.

There is no danger of them being dissatisfied, and most of them are very thankful that the paper was brought to their notice. If the breeder had a lot of samples to distribute the mare owner would take the sample copy, put it in his pocket and never read it; he would take this opportunitl as an excuse to get away. But if the breeder will insist upon getting his subscription then and there nine out of ten will take it. If an effort is made during the next few weeks of the breeding season to solicit every man who brings a mare to the barn it will result in a larger percentage of foals and a better class of foals and in the end make more money for the stallion or jack owner, as well as the mare owners. Don't overlook this golden opportunity at this particular time, but get busy.

STALLION FEED SCARCE.

In many sections good, bright oats and suitable hay are very difficult to obtain. But this is the most profitable feed for valuable stallions during the breeding season. Many breeders have not provided a sufficient amount nor the right kind of feed for this breeding season owing to its scarcity. Some are feeding cotton seed meal, which should never be fed to horses extensively, and more especially to stallions and jacks that do not get a sufficient amount of exercise. Some are forced to feed moldy feed, which is usually injurious to any kind of breeding stock. It would be more profitable to buy the expensive feed and feed it a little oftener in smaller quantities than to take chances on injuring a valuable animal. Those feeding corn should be sure that all ears are free from must and that all injured grains are shelled from the points. Corn is not a very good feed for stallions or jacks, but it is better than nothing.

In many sections the grass will soon do to mow. This should be fed very sparingly at the start, but can be increased gradually each day until it will make the principal hay ration. For the best results it should be fed green, without allowing it to partly cure. Stallions or jacks will do better on old hay if it is of good quality than too much green stuff until they become accustomed to the new feed.

Plenty of salt should be kept by the stallion or jack at all times, and more especially while green feed is being given.

FREE SUBSCRIBERS.

An Iowa beef cattle breeder writes that he would like to have his name put on our mailing list—that he is an extensive advertiser and will use the American Breeder to sell his beef cattle. We appreciate the offer to advertise with us, but we have no free mailing list. That was one of the ironclad rules when this paper started that it should comply with the postal laws, which prohibit sending out papers as first class matter to free subscribers. Years ago newspapers were lax in this respect, and there may be some that have not yet entirely complied with the postoffice rulings. The subscription price to the American Breeder is low enough for a breeder to subscribe for it in the regular way. Occasionally we send out a sample copy, with a stamp on it, but we have no free mailing list, and those who expect to read the American Breeder regularly will send in the subscription price in advance. The paper stops promptly at the expiration of the paid up time.

PARTIALLY PERSONAL

The record for stale news is now held by the stock yards dailies with imitation telegraph news service which "covered" the Titanic disaster.

Since the small-pox quarantine was declared at the state prison in Jefferson City, Mo., outsiders avoid the place as much as possible, and insiders are not allowed to leave it.

A man at Potsdam, N. Y., advertises "Shetland Ponies and Babies," but it develops, on reading the ad that you are to raise your own babies—with the ponies' help.

S. M. Jordan, one of the leaders in the Missouri agricultural college extension work, has been engaged by Pettis County, Missouri, to give his entire time to the farming interests of that county.

A president has finally been secured for the Iowa State College of Agriculture—Dr. Raymond A. Pearson of New York. Dr. Pearson has been for several years, Commissioner of Agriculture in New York.

John Letham, widely known as manager of the Woody Lea Herefords (until the herd was dispersed), and one of the best posted men identified with the breed, has joined the staff of the American Hereford Journal.

Geo. H. Burge, a well known Shorthorn cattle breeder of Iowa, announces himself as a live stock auctioneer. From $25 to $100 for a day's work looks good to many people, although the jobs may be scattering at first.

"Hay Scarce This Year," declared a headline in the Kansas Industrialist of April 6. The esteemed Industrialist may not have noticed it, but by April 6 the stockmen of its state were not limiting themselves to the word "scarce" in describing the hay situation.

Young Editor—In case you find yourself short of "dope" for your paper, prepare an article stating that it is impossible to give attention to the many unsigned communications received. This has been known to start correspondence where other means have failed.

A recent issue of the Kansas Industrialist might have been called the "Fertilizer Number." It contained three articles on potash, one on barnyard manure, four book reviews (not the Walt Mason kind), and introduced a personal paragraph as follows: "Dean Willard, who was fifty years old last Tuesday—and looks thirty—"

In connection with the fight which the Dairy Union is making against oleomargarine, a committee of five has been appointed to fix a "color standard" for the "oleo." We will just save the work of four men. Make 'em ('em means the packers) color it like a green window shutter. Then nobody will eat it—and that is what the Dairy Union wants.

John Fields, the (not "of the") Oklahoma Farm Journal, believes that too many institutions of "higher education" have been placed in Oklahoma towns as "political pork," and that the interests of the school population and the taxpayers demand that less money be spent for this sort of thing and more for the rural schools. And what John Fields believes he is in the habit of saying, and it is generally pretty sound doctrine.

Ensilage in Cattle Feeding

Does Not Reduce Value of Corn For Hogs Following Steers. A Test in Comparison With Shock Corn and in Connection With Other Feeds. Silo History and Silage Cost.

Written for The American Breeder,
By Prof. Henry P. Rusk, University of Illinois.

THE art of preserving green crops as ensilage has long been known. It was first practiced in European countries in the preservation of beet leaves, beet waste and even green grasses, and later extended to the preservation of the Indian corn plant. Thirty-five years ago (1877), a French farmer, Goffart, published a book, giving the results of twenty-five years' of practical experience with silage and recommending the corn plant as possessing peculiar advantages for this purpose. It was about this time that Frances Morris, a Maryland farmer, erected the first silo ever built in America. And five years later American experiment stations became actively engaged in the investigation of silage and its usefulness in American agriculture. In spite of the fact that the results of these investigations and the experience of practical stockmen were almost uniformly in favor of ensilage, the American farmer was slow to adopt this method of storage, probably because American agriculture was too young and our virgin soils too rich and plentiful to encourage conservation of its products.

In America, this method of utilizing the corn plant found its earliest advocates among the dairymen and it has so increased in favor with that class of stockmen that you can scarcely find an up-to-date dairy farm that does not count among its various items of equipment at least one silo. In fact, most dairymen have come to believe that it is practically indispensable to the successful operation of their business.

Recently many cattle and sheep feeders have learned the economic value of the silo in their business and the number of silos erected annually has increased by leaps and bounds during the last few years. One of the leading silo manufacturing concerns recently stated that there were 15,000 users of their silos in this country. It would indeed be a very conservative estimate to say that their output would not represent more than 10 per cent of the silos in use. This makes the total number in use at the present time at least 150,000. And the present scarcity of roughage means that more silos will be erected during 1912 than ever before in a similar length of time.

Now let us see what there is about corn silage that is making it so popular with stockmen. First, it makes possible the utilization of the whole corn plant. Under the ordinary methods of harvesting in the corn belt the stalk and leaves, which contain from 35 to 40 per cent of the digestible nutrients of the corn plant, remains in the field and is practicaly a total loss so far as its feeding value is concerned. In some instances a slight portion of its real food value is secured by pasturing the stalk fields, and in other instances still more is utilized by shocking the corn in the field, but this latter method is practically half as expensive as putting the corn in the silo and under the most favorable conditions field cured fodder loses much more of its nutritive value than does siloed corn. Then, too, 25 to 50 per cent of field cured stover will be refused because it is woody and unpalatable, while properly siloed corn will be completely consumed. This is because the cellulose or crude fiber in the cell walls is partially digested by the chemical changes which take place in siloed corn, making it softer in texture and more palatable. In fact it makes a succulent and appetizing roughage that fills the same place in winter feeding that blue grass pasture does in summer feeding, and makes it possible to secure equally good results from a much smaller acreage.

Second, instead of feeding cattle in order to profitably utilize the roughage on their farms many corn belt cattle feeders are face to face with the problem of securing some efficient and cheap roughage in order to economically feed cattle. When properly supplemented corn silage is one of the most efficient and economical roughages the corn belt cattle feeder can use. And considered in the light of present prices for all kinds of dry roughages it is certainly cheap. The cost of corn silage to the farmer is the cost of putting it in the silo plus the value of the corn and stover in the field and an allowance for shrinkage. Some might contend that the cost and up-keep of the silo should also be considered; but the equipment of every feeding plant must include some storage space and since a ton of silage occupies only 50 cubic feet of space, while a ton of well settled clover hay occupies approximately 550 cubic feet, it surely should not be considered an additional expense. In Bulletin 101 of the Illinois Experiment Station is given the results of a series of tests conducted on a large number of farms in various parts of the state to determine the cost of putting up silage. This bulletin shows that the average cost of putting up a ton of silage on the farms visited was 56 cents. Taking that as a basis, I have computed the cost of the silage used in our cattle feeding experiments during the last two years.

During the season of 1910, our silage made about 15 or 16 tons to the acre and contained 3.99 bushels of corn per ton, allowing 50c per bushel for corn in silage and at the rate of about $1.50 per acre for stalks we have for the cost of one ton:

$2.00	for corn
.10	for stover
.56	for siloing
$2.66	
.13	5 per cent for shrinkage
$2.79	Total cost of ton of silage

Our silage this last year was a little richer in corn and figuring it in the same way that which we have used so far, runs $3.16 per ton.

At the Ohio Experiment Station six lots of cattle were fed to test the replacement value of silage. There were seven steers to the lot. Lots 1, 3 and 5 were fed a ration of corn, cottonseed meal, corn silage, stover and mixed hay. While Lots 2, 4 and 6 received the same kinds of feeds with the exception of corn silage. "It was found that under the conditions of this experiment, one ton of silage was equivalent to, or replaced 4.4266 bushels of corn, .1369 tons of stover and .257 tons of mixed hay." Charging corn at 50 cents per bushel, stover at $4.00 per ton and mixed hay at $12.00 per ton, the replacement value of one ton of corn silage under the conditions of this experiment was $4.96. However, there were 6.6 pounds of pork produced for every ton of silage fed and deducting that at 5 cents per pound, the Ohio Experiment Station get a net replacement value of $4.63 per ton.

In this experiment the silage fed cattle were not fed grain according to appetite, but such amounts that the grain fed dry and the grain in silage would equal grain fed dry fed lots. The pork produced per bushel of dry corn fed was more in silage fed lots than in dry fed lots and had these cattle been fed according to appetite, it is quite possible that they would have to add a little pork per ton of silage fed instead of substracting.

At the Illinois Experiment Station, Professor Mumford fed two lots of Aberdeen Angus cows to determine the relative value of corn silage, and shock corn for wintering breeding cows. One lot received corn silage, clover hay and oats straw, while the other lot received shock corn, clover hay and oats straw.

The value of the shock corn fed is based on 50 cents per bushel for the corn contained in it and $2.50 for the fodder. The corn silage used in this experiment contained 7.13 bushels of corn per ton. Using the method of calculation previously explained in this article the total cost of this silage was $4.43 per ton. These figures show that the corn silage fed not only replaced enough other feeds to pay its cost, but yielded an additional profit of $1.12 per ton. Another important result that cannot be accurately measured was the difference in thrift of the two lots. The silage fed lot was much thriftier than the dry fed lot and came out of the experiment in much better condition. During the experiment Lot 1 gained an average of 1.07 pounds per cow per day, while Lot 2 made an average daily gain of .75 pounds.

WINTERING COWS—140 DAYS—10 COWS PER LOT.

Lot No.	Rations	Tons per Cow	Replacement Value of Ton of Silage.	
1.	Corn silage	1.165 Tons		
	Clover hay	.245 Tons		
	Oats straw	.667 Tons		
2.	Shock corn	.609 Tons	.523 Tons at $10.17	$5.32
	Clover hay	.245 Tons	None	
	Oats straw	.758 Tons	.976 Tons at $ 3.00	.23
	Total replacement value			$5.55

During the past few years there has been a country-wide interest awakened in the production of alfalfa. It was reported at the Illinois State Alfalfa Growers' convention last summer that alfalfa was being grown in practically every county in the state and that the estimated acreage in Illinois for 1911 is something like 30,000 acres and the number of successful fileds over 3,000.

With this awakened interest in the production of alfalfa comes a call from the stockmen of the corn belt for information regarding the feeding value of alfalfa compared with the other available roughages, and especially regarding the various combinations of alfalfa and corn silage that may be expected to give the best results in the feed lot. In answer to this demand for information the Illinois Experiment Station has inaugurated a series of experiments to determine the relative value of various combinations of corn, corn silage, alfalfa, cotton seed meal and some of the more common available corn belt roughages. The first of these experiments was conducted during the winter of 1910-11, and a part of the results of that test are shown in the following table:

ILLINOIS CATTLE FEEDING EXPERIMENTS, 1910-11.

Length of Experiment, 126 Days. Ten Steers Per Lot.	Steers fed corn, clover hay, silage	Steers fed corn, alfalfa silage	Steers fed corn, cotton seed meal, silage.	Steers fed corn, cotton seed meal, alfalfa.
Ave. initial weight, pounds	922.5	943.	914.	913.5
Ave. daily gains, lbs.	2.048	2.38	2.55	2.874
Cost of grains	$6.80	$6.80	$6.84	$6.72
Pork, per bu. of corn fed, lbs.	1.07	1.37	1.21	1.24
Necessary selling price	$5.16	$5.17	$5.24	$5.24
Actual value in lots	5.65	5.75	5.75	6.00
Profit per steer (pork included)	5.78	7.21	6.33	9.78

Based on the following prices for feed: Corn 40c per bu., cottonseed meal $28.00 per ton, silage $2.80 per ton, alfalfa $16.00 per ton, and clover hay $10.00 per ton.

A comparison of Lots 1 and 2 in the foregoing table shows that the use of alfalfa hay in the place of clover increased the average daily gain from 2.048 pounds to 2.38 pounds. The pork produced from the droppings was increased .3 pounds per bushel of ear corn fed by the use of alfalfa in the place of clover. Due to the greater cost of alfalfa hay, the cost of gains in Lot 2 was as high as that in Lot 1. There is also practically no difference in the necessary selling price. But the actual value of the alfalfa-fed cattle was $5.75 per cwt., while that of the clover-fed cattle was $5.65, showing that the alfalfa-fed cattle had attained a higher degree of finish than the clover-fed cattle. The profit per steer in the clover-fed lot was $5.78 per steer, while the alfalfa-fed lot returned a profit of $7.21 per steer. The foregoing data show very clearly that when used with a full feed of broken ear corn and corn silage alfalfa hay gives much better results than does clover hay.

A comparison of the last two lots in the table shows that the use of alfalfa alone as a roughage produced more rapid and economical gains than did the use of corn silage. There was not a marked difference in the amount of pork produced per bushel of corn fed, and the necessary selling price was exactly the same. However, the marketable finish, as indicated by the actual value in lots, was much higher in the alfalfa-fed lot than in the silage-fed, making the resulting profit per steer $6.33 for the silage lot and $9.78 for the alfalfa lot.

A comparison of Lot 4 with all the other lots shows that, contrary to general opinion, the feeding of silage does not materially lessen the amount of pork produced per bushel of corn fed. Such a comparison also shows that under the conditions of this experiment alfalfa hay, at $16.00 per ton, proved to be a more economical roughage than corn silage or the combination of corn silage with either clover or alfalfa hay.

THREE NEW RECORD VOLUMES.

This office has just received the latest record volumes from three of the swine breeders' associations as follows: Volume 40 of the National Duroc Jersey Record located at Peoria, Ill., J. R. Pfander, secretary; Volume 6 of the American Hampshire Record, E. C. Stone, secretary, Peoria, Ill., and Volume 34 of the American Duroc Jersey Record, Robt. J. Evans, secretary, Chicago, Ill.

The high numbers in the first named record are 118899 for boars and 304698 for females. This means that half the numbers given (of the respective sexes, have been recorded with this association, as odd numbers are given to boars and even numbers to sows. The other records follow the same rule. The high numbers for Hampshires are 7027 for boars and 12220 for sows. The high numbers for the other Duroc record are 38599 for boars and 88000 for sows.

Higher Market Levels Reached

Horse Demand Broadened. Single Mules Reach $300. Prime Beeves Reached $8.85. Scramble For Good Stockers Continues. Hog Top Sticks Around $8. Sheep Jumped Up.

Factors which earlier in the season operated as a restraining influence in the horse market have been adjusted, and together with nominal demand from all sources the volume of business is large. The South was hindered by floods and heavy rains at a time when they usually buy the bulk of their horses, and it was not until in the past ten days that they began making up for lost time. This outlet has been broadened by farm requirements from new sections in the West and Southwest—and also by an urgent demand for army horses and mules. As opposed to the open outlet channels, receipts were smaller. Country buyers say it is hard to pick up a load of good horses on short notice, and the bulk of horses coming are those out of work, and in none too good condition. Prices continue very firm. Dealers in some cases were willing to quote an advance on the best grades, though the plainer kinds they thought no more than strong.

Army Demand Helps Market.

In April about 1,200 horses and mules were purchased in Kansas City and adjoining territory by the United States government for army use. Some were purchased on the open market and others were accepted on contract by regular agents. Normal purchases, by the government in this section, for one year are about 2,500 head, so that last month's sales were about six times larger than usual. Most of the horses have been shipped to the Mexican frontier and were for immediate use. Horse men at the stock yards are inclined to believe that the government is preparing for trouble with Mexico. If such is the case, and war is declared, there will be an unprecedented demand for horses, as the campaign will be carried on from the north and across the country.

Big Mules Sell Well.

Weight is a big factor in the mule market. There is so much heavy work in progress throughout the country that construction men say they are unable to get all the heavy mules they need. Prices are high, but that apparently does not interfere with demand. Last week Willsie & Whitlow of Atchison county, Mo., brought in two car loads of 1,390-pound mules, good hardy colors, principally grays and browns, and well mated, four to seven years old. They sold the first clip out at $280 a head. Some heavier mules sold at $285 to $300 a head, but only in small bunches, and dealers say there never has been a time when prices were higher than at present. Lighter weights, of course, are not so high, but still sell well.

Prevailing prices for serviceably sound horses and mules, 4 to 7 years old, are as follows:

Drafters, 1,700-pound up	$180@300
Drafters, fair to good	155@175
Chunks, Good	130@165
Chunks, fair	95@130
Southerners, good to choice	130@150
Southerners	70@125
Driving horses	65 up
Mules—	
13½ to 14½ hands	$ 95@130
14½ to 15½ hands	125@175
15½ to 16 hands	165@220
16½ or better	200@300

Cattle Making New Records.

Early last week demand for cattle hesitated owing to a moderate increase in the supply, but later in the week the market turned up again, and the advance soon brought values up to the record levels, and in the past two days slight net advances occurred. Last Wednesday when the best cattle of the week were offered steers on the native side brought $8.60 and $8.65 for tops, and averaged 1,344 and 1,472 pounds. Yearlings sold up to $8.25, and on the quarantine side $8.30, the second highest price in the history of the local market, was paid. The record, $8.40, was made in March, 1910, when some show cattle from Fort Worth, Tex., brought $8.40. As to the $8.60 and $8.65 cattle they brought the highest prices ever paid at this season of the year, and have been surpassed only in the fall of 1910, when some extra prime corn fat steers brought $9 and better on the open market, and show cattle sold up to $10.50. If the market shows the usual advance for fed grades by fall, that has occurred in former years, over spring prices, fed steers in September will be selling at $10 or better. Scarcity is the cry fro mall sources. Buyers say that the high prices for beef has checked the demand to some extent, but still they keep on buying, and are unable to force any break in prices. Some dealers are forecasting a break in the market as they say that strawberries are becoming plentiful, eggs are lower in price, spring chickens are tempting, and there is a profusion of green stuff on teh market. Their argument is that anything that diverts demand from established lines will check demand on commodities that are advancing in price. The exact position of the steer market compared with two weeks ago is 10 to 25 cents up. More advance was made on the medium grades than on the better classes. The bulk of the steers are selling at $7.25 to $8.25.

Some Texas Grassers Offered.

Several car loads of Texas grass fat cattle have arrived on the quarantine side in the past ten days. They were from Southwest Texas, and strictly speaking had been fattened on early weeds, as they preceed the growth of grass. Some sold at $5, some at $6.60, and others with a touch of cotton seed cake brought $7. In a few weeks such cattle on the quarantine side will be fairly plentiful and packers are figuring on herding the market down on medium classes of natives from that competition.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$8.60@8.85
Good to choice steers	8.00@8.55
Fair to good steers	7.25@8.00
Common to fair steers	6.00@7.20
Meal fed, choice	7.50@8.60
Meal fed, common to fair	6.00@7.45
Grass fat	5.00@7.00

New Influence in Butcher Cattle Trade.

Buyers in the past two weeks have been insistent in their demand for lower prices on medium cows. At times they were able to get 25 cent concessions, but as a rule the market promptly recovered. Their claims to lower prices on medium grades is that animals make a strong showing of grass at this season of the year, and consequently killing percentages are low. The movement of early fat Southern cattle will affect of the trade more than ices are expected to decline materially in the next few weeks. The good to choice fed butcher cattle are strong and slightly higher than two weeks ago. Handy weight heifers and steers and heifers mixed have taken precedent in demand, and some of the latter have sold as high as $8.25. Heifers sold up to $7.80. Veal calves last week declined 25 cents, and in the past few days were up again, closing 25 cents higher than two weeks ago.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice	$6.75@7.25
Fair to good	5.75@6.70
Common to good	4.25@5.70
Canners	2.85@4.20
Heifers—	
Choice	7.40@7.90
Good to choice	6.75@7.40
Plain to fair	5.75@6.70
Common	4.50@5.70
Veal calves	4.00@8.00
Bulls	4.50@6.75

Getting Thin Cattle a Problem.

With plenty of grass in sight and few thin cattle coming, countrymen are rather undecided what to do. Prices, of course, are high, and with no feed available other than the new grass, stockmen do not know whether to risk buying now, save the grass and trust to luck for the production of a big corn crop. Should a big corn and forage crop be raised prices for thin cattle this fall would be prohibitive. Many old-time stockmen are doing their usual spring buying regardless of cost. Prices now are as high as at any time this year. Killers are crowding feeder buyers out on those with any weight, and reports from the pasture sections of the West indicate an unusually large number of young cattle coming, and a scarcity of threes and fours. This will tend to make weight at fall marketing light.

The following quotations are for stock and feeding cattle.

Selected feeders	$ 7.00@ 7.50
Good to choice feeders	6.60@ 6.95
Plain to fair feeders	5.75@ 6.55
Selected stockers	6.50@ 6.90
Good to choice stockers	6.00@ 6.45
Plain to fair stockers	6.00@ 6.45
Stock calves	5.00@ 6.75
Stock cows	3.85@ 5.00
Stock heifers	4.25@ 5.50
Milch cows	40.00@90.00

Hog Market in a Rut.

In the first two and one-half months this year prices for hogs held at $5 to $6.50. About the middle of March there was a material advance and quotations were moved up to $8. Since the last of March prices have held at $7.50 to $8.05, varying only 15 to 25 cents weekly. Eight cents in the past six weeks has appeared as much of a stumbling block as $6.50 did in the first two and one-half months this year. In other words the market now is in a rut. Two weeks ago hogs sold up to $8.05. In the next few days the market broke 15 to 20 cents, and then regained the loss. In the past few days there was a 15 to 25-cent decline or that much net loss from two weeks ago. Chicago, Omaha, and St. Joseph have been able to show supplies larger than a year ago, but April receipts in Kansas City were more than 100,000 less than in the same month in 1911, and St. Louis showed a 47,000 decrease. The territory that is shortest on hogs is Kansas and Missouri. However, a shortage is expected to show at other markets in the next month, and by fall good fat hogs will be scarce. Prices of provisions are rising in anticipation of decreasing supplies, and a good many wagers have been made that $9 or better would be paid before next September.

The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week.
Mon., Apr. 29	$7.60@8.00	$7.40@7.80
Tuesday	7.50@8.00	7.40@7.82½
Wednesday	7.40@7.85	7.40@7.82½
Thursday	7.40@7.80	7.50@7.95
Friday	7.30@7.75	7.60@8.00
Sat., Apr. 27	7.60@8.05	7.50@7.85

The following quotations are for hogs:

Choice, 250@300 lbs	$7.65@7.75
Choice, 200@245 lbs	7.60@7.72½
Medium weight	7.50@7.70
Light weight	6.40@7.50
Common to fair	5.50@6.40
Stags	5.00@7.40
Boars	4.25@6.50
Bulk of sales	7.30@7.70

Sensational Rise in Sheep.

In the past two weeks prices for sheep were advanced $1 to $1.75 a hundred pounds, and with the exception of April, 1910, when lambs sold up to $10.25, were the highest on record. This week wooled lambs sold up to $10.10, clipped lambs $9.25, spring lambs $14.25, wethers $8, yearlings $8.50, and ewes $7.25. Several loads of Texas grass fat sheep brought $6.60 to $7. The advance was not wholly expected, as packers for some time have been figuring on large enough supplies of fed grades to carry them through to a time when Southern spring lambs, and clipped Texas sheep would be plentiful. A readjustment on a scale downward is expected in the next two weeks.

The lot of steers fed corn, cottonseed meal and silage for 160 days, valued at $8.75, and which returned a profit of $26.21 per head; last winter's steer feeding experiment at Purdue University. (See page 15.)

THIS MARE A PRODUCER, TOO.

To The American Breeder: I have a mare that I think beats Mr. Rawlins' mare, or Mr. Stickelmaier's either. She has had fourteen colts, having two sets of twins. She has had six years of rest without being bred. She will be 25 years old the 15th of April, 1912. She has a Percheron colt by her side, foaled September 2d, 1911, which is about fourteen hands high, and weighs enough for its height. She suckled this colt and held up fairly well this winter. She can eat corn and hay as well as she ever did. She has made a hand on the farm ever since she was two years old. She is of the old Sweet-Brier and Canadian stock.—I. P. Limbaugh, Cape Girardeau County, Missouri.

WHAT VETERINARIANS SAY.

To the American Breeder:—Enclosed find 50 cents in stamps for one year's subscription to the American Breeder. I recently received your sample copy of March 5 with articles on barren mares and the capsule system of breeding and will say that I was very greatly interested in your paper. I must congratulate you on this issue of your paper and will say further as a practicing veterinarian that I am open to learn from the columns of a practical stock paper. Please forward the paper to my address.—Dr. Geo. A. Scott, Waterloo, Blackhawk county, Iowa.

QUESTIONS AND ANSWERS.

(Continued from page 6).

SORE HEELS—I have a jack that at times won't serve on account of cracked heels. They become very sore, and he lays down most of the time when they are sore. I keep his stall and lot as sanitary as possible. Please tell me what do do.—Kansas Subscriber.

REPLY—Reduce the inflammation of the parts first by applying large, warm antiphologistine packs to the heels, keeping them in place with bandages. Remove the packs twice a day and add some fresh antiphlogistine. After the soreness subsides dust the wounds with calomel twice a day. If you keep the stall in a sanitary condition and give the jack proper feed and care there should be a marked improvement in a short time.

RUPTURED COLT—I have a stallion colt, foaled April 15, 1912, which is ruptured between the hind legs. What can I do for him? Could he be castrated and sewed up so as to keep it back, or should some medicine be used?—Minnesota Subscriber.

REPLY—This colt can be operated on by a qualified veterinarian and castrated in a manner so as to reduce the hernia completely.

CROOKED KNEE—We have a Percheron colt, two months old, that has a crooked knee. His left knee bends in at the joints, so that it nearly bumps the other knee. We had a boot made with a joint on it, but it didn't work very well. Lately we have been rubbing and trying to work it in shape that way. He has been that way from birth.—Minnesota Subscriber.

REPLY—It is not often that these crooked little fellows need help to overcome their numerous deformities that show up at birth as they incline to gradually outgrow them as they get older. It is quite difficult to apply anything in the way of a splint or support without interfering with the colt taking the necessary exercise or causing chafing of the parts. A reasonable amount of exercise is very necessary to recovery and we believe you will strengthen the part and get along the best by giving the joint daily hand rubbing with dilute alcohol.

PARTIAL PARALYSIS—On the 28th of November, while driving one of my work horses to my hack (without any warning or sickness) he dropped in the road and could not get up. The second day I raised him with blocks and he walked home about one mile. Every since then, when he is down, I have to raise him with blocks. For a while when down, if laid out on his side he could raise his head up. I would raise his head about eight or ten inches and he would get to a sitting position. About six weeks ago he had a swelling begin at each of his hips, running forward across his flanks, also on right stifle. They disappeared and in a few days appeared between his fore legs and extended back to the end of his ribs. The swelling gradually worked bac ktoward his right flank and hips. There it stopped and gradually got worse. I lanced it, and it ran pus for about 35 days. He had very little use of that leg during this time. About a week ago the same kind of swelling came on his left hip joint, and extends more above—toward the back bone. His leg is swollen down to the stifle joint. This horse has a good bright look and eats and drinks about as usual. At times I try him, and I don't think his vision is very good. Is there any remedy or cure for him? What is the name of this disease and what causes it? Is it contagious? The horse in question has been kept up, and I feed and work him all the time. I lost his mate two years ago this winter, with the same disease.—New Mexico Subscriber.

REPLY—Your horse is evidently partially paralyzed from some disturbance in the brain of which we are unable to determine. We believe the local swellings that have developed are a result of infections through abrasions that naturally take place in animals that are down an unusual length of time. One of the difficult things to handle in horses that are forced to remain down very much are the bed sores. Well bedded box stalls should be provided and antiseptic lotions applied at frequent intervals in such cases.

CRIBBER—What causes a horse to be a stump or manger sucker? Will this hurt his value, and if so, what per cent?—Kentucky Subscriber.

REPLY—Numerous theories have been set forth as to the cause of cribbing, but it yet remains a problem. One thing is certain, it shortly becomes a habit that very few horses give up. It frequently becomes a menace to the horse's health, inducing digestion, disorder and is classed as an unsoundness.

DEAD FETUS—Tell me how long will a mare carry a colt (of 6 or 8 months) after it is disconnected or killed by slip or a strain not sufficient to cause it to be thrown at the time?—Kansas Subscriber.

REPLY—No definite time could be given in answer to the above inquiry for the reason that much depends on the amount of local disturbance induced at the time of injury. In many cases a reaction occurs in a very few hours or days and the mare aborts. In others the disturbance is not sufficient to excite labor pains and the fetus may remain indefinitely. In other words, it may mummify and remain in the womb as long as the mare lives.

METRITIS—A had a 5-year-old mare, due to foal about March 28. On March 14, A got up late and found the mare trying to have her foal, but it seemed that she needed help, and A tied a rope to the foal's front feet, and used the force of two men and pulled the colt away in no time. The colt's feet at the hoof were bent backwards, but otherwise it was all right, except that it was dead. The mare did not clean for three days after; then as A was coming into the barn, the mare which had been lying down, jumped up, and stepped on the end of cleanings and pulled them from her. We thought that part of the afterbirth did not come from her, and got a horse doctor to examine her womb, and he said it had all come away. The vulva was swollen quite large, but otherwise the mare seemed to be quite well, and would eat and drink a little at a time. She was in a large box stall in a fairly good barn. On the fourth day, after the foal had been born, the mare began to strain every few minutes, and to make water. Water seemed normal, but she continued to increase the straining. She would lie down and then sit up for ten minutes at a time. Now, was this womb flooding, or blood poison, or both? After four days the mare refused to eat or drink and seemed in great pain, sitting up and lying down all the time, and on the sixth day she died. She was strong, and stood up and walked five minutes before she died. No medicine, but one ounce of alcohol was given, which seemed to increase the pain. Now, what we want to know, is this: Did pulling that foal from the mare cause anything to hurt the womb, or cause blood poisoning, or was it the afterbirth remaining in the womb four days that caused blood poisoning or womb flooding? We contend that had the afterbirth been taken away a few hours after the birth of the colt, the mare would have lived. What should be done to prevent blood poison? What should be done in case of womb flooding? Is womb flooding a sign of blood poisoning? What should be done in cases like the above? There are a good many farmers here that have mares to foal soon, and they always wait until the mare gets sick before they look for a remedy. If you will kindly answer, through The American Breeder, you will oblige a good many subscribers, and may save a good many colts and mares. We have quite a lot of pure bred mares here.—Nebraska Subscriber.

REPLY—Your mare died as a result of either rough manipulation during the removal of the colt or from the effects of the retained after-birth. It is simply folly and a losing proposition for the average stock owner to venture to remove either the foetus or the after-birth in mares where it becomes necessary to introduce the hand into the uterus. Such cases too often result in infection which nearly always means death to the mare. Qualified veterinarians with all their knowledge of the subject of infection frequently lose these cases in spite of skill and the average stock man and unqualified horse doctor should abstain from going beyond gentle external assistance. An afterbirth should not be permitted to remain longer than twenty-four hours, provided it can then be easily detached and removed. Whenever force is used lasceration of the uterine wall results, which opens up small areas for infection to enter. In case of valuable mares, such as are being encouraged in your locality in the way of pure bred stock, by all means employ the best veterinary talent obtainable. We speak from years of observation and know it pays.

NAVEL ILL—About two weeks ago I wrote a piece for your paper about navel ill and joint ill and gave my experience, as my colts do not come in contact with a stable and yet get this disease, and it comes in new places. It seems to be carried in the mare's blood from year to year. Is there some way to eradicate it in the mare's systm? You print others' letters and give them advice. I have taken your paper for three years and expect to be treated like your other patrons. If there is any objectionable feature in my letter, leave it out.—Kansas Subscriber.

REPLY—It is not likely that navel disease is carried in the blood of a mare, but after the fetus is delivered, the navel cord breaks and comes in contact with germs that thrive in manure piles and other places. These germs enter the navel cord and find their way into the blood circulation of the colt. There is one difficulty resulting from tying the navel cord, and that is, after the germs have lodged in this canal the string tied below them prevents their escaping. While on the other hand, if the navel is stripped downward, pushing the fluid out at the bottom, and then a dusting powder is applied which will close the opening, infection cannot enter through the cord. One of the old successful methods has been to put a bandage around the colt so as to bind a disinfectant on the navel cord; but it is difficult to keep the bandage on. The most successful way of handling this condition is to use the dusting powder, which destroys the germs and dries up the navel cord. This is very easily done and is the surest and safest way. There are more colts lost by germs entering the navel than all other colt diseases combined. Navel infection is one of the most fatal diseases we have to contend with. The prescription we have found most satisfactory in preventing this disease cannot be filled at the country drug store, and if it could, it is too expensive to use, as a rule. This is the reason we have contracted for a large amount of dusting powder, which we can sell to our readers for 50 cents a can. It is put up in a metal box, like a pepper box, so that it can be used without waste. Ten colts can be treated with this powder for 50 cents. It can be purchased from The American Breeder.

WEEDS IN HAY—Will it hinder a stallion from getting mares in foal by feeding hay containing dog-fennel?—Washington Subscriber.

REPLY—We have never known of a case of this kind being tried out and we do not believe it wise to experiment on a valuable stallion with any questionable feed. If such feed must be fed, let it be reserved for less valuable animals. A stallion should be fed nothing but the very best.

CHRONIC LAMINITIS—Have a 9-year old mare that was foundered when four years old. She is stiff in the morning, but after traveling about half a mile, she goes all right. Can you tell me what I can do for her?—Illinois Subscriber.

REPLY—Chronic laminitis is not a disease that can be treated very satisfactorily, as it is difficult to cure. Such an animal should always be kept and worked on soft ground. For the reason that the chronic inflmation of the feet induces a very dry and hard condition of them, the feet should be poulticed or soaked in water at intervals. After they are softened by one of these processes, apply a blister around the coronet allowing it to extend up about two inches. First clip the hair from the part to be blistered and then apply the following, rubbing in well for several minutes with the hand: Powdered cantharides, one-half ounce, biniodide of mercury, one dram, lard three ounces. Mix all together and apply as directed. Allow to remain on for twenty-four hours and then remove by washing with warm water and castile soap. Keep the horse's head tied up while the animal is being blistered. For a few days afterwards apply a little cotton seed oil to the parts to keep the skin soft. Repeat the blister in three or four weeks.

HERNIA—I have a mare, ruptured in the left side, just under the flank. There was a bruise on the under side of the rupture indicating that she had fallen on a rock. I cut it open and put the entrails back, and took five stitches in the inner lining, the tear being about four inches long; also stitched the outside, but not so closely, using silk. This was about four months ago and apparently it has not healed. There is a slight swelling and a scab which breaks open occasionally discharging a white matter. The mare runs in pasture and does as well as any; is bred again this spring; there being no veterinary near, I write for information.—Wyoming Subscriber.

REPLY—It would appear that the deeper stitches have not absorbed, but have remained where placed and are keeping up some irritation the same as some other foreign body. Inasmuch as the parts are not much swollen at this time it would seem that the deeper parts or muscles have united pretty well. It would perhaps be a safe plan to open the skin wound sufficiently to search for the deeper stitches and if they are found remove them, as they have done all the good they will do.

FOOT INJURED BY SNAG—I have an imported mare that stuck a snag in her hind foot, just above the hair of the hoof about the first of December, and have doctored her all winter. The sliver worked out, or part of it did, but she has not put any weight on the foot yet, and there is a growth around her ankle just above the hoof, as large as my wrist, which has broken in five or six places. I can't get it reduced or healed. I think the hoof will come off. Will a new hoof come on?—Kansas Subscriber.

REPLY—We fear you case has reached a point where we are unable to prescribe any medicine that will help your mare. The proper thing for you to do, and what you should have done with so valuable an animal long before this, is to take her to some competent veterinarian with the idea of submitting her to a surgical operation. It is quite probable that a portion of the snag is yet in the foot and is responsible for its breaking out in several places. At this time there already may be developing a ring bone, or perhaps the joint itself is opened. By all means have a careful examination made by a qualified man.

SWOLLEN SHEATH—I have a smooth gelding with a badly swollen sheath. Examination failed to show any "bean" or a very dirty interior. His hind legs are also swollen. He has very little difficulty in urinating. What, in your opinion, is wrong with him? And what treatment would you advise?—Kansas Subscriber.

REPLY—A swollen sheath may result from a variety of causes, among which may be mentioned, filthy condition of the parts, very fat animal, irregular or no exercise, heart diseases or other interference with the circulation. The sheaths of horses are often caused to swell from rough manipulation during an examination or from the application of irritating substances such as lard. If the above suggestions do not enable you to locate the cause, we would suggest that you have him examined by a graduate veterinarian.

RIDGLING HORSE—A year ago I castrated a 5-year-old stallion that had never been used as a breeder, but a farm work horse. He was very keen after mares and had served a few. Only one testicle had entered the scrotum; this was a well developed seed and I clipped the end of the scrotum and removed the testicle, taking as much of the cord as I could with it. The other testicle had never entered the scrotum and I thrust my hand through the canal, through which it should have entered, and found a small testicle about one-fourth natural size, which I removed with all the cord that it was possible to get. This horse soon recovered, and this spring he is bad after mares, and can serve as readily as though he had

never been castrated. Please tell me what to do in order to stop him from serving.—Texas Subscriber.

REPLY—We fear your horse has not been properly castrated, and the way to stop the annoyance is to have a competent surgeon operate on him. We suspect that the part removed was not the testicle proper, as it is a very easy matter for one not fully familiar with these cases to be misled.

FEEDING LINSEED MEAL—I am feeding a good handful of old process linseed meal to my stallion and jack three times a day. Is there any danger of this affecting their breeding? Have never used linseed meal before. —A Kansas Subscriber.

REPLY—We have always regarded linseed meal or ground oil cake a valuable feed for all animals when fed in proper amounts, and believe you will experience no bad results from the amount you are feeding.

SWOLLEN HOCK—I have a mule colt, twelve days old, that is weak in the hind legs. The right hind leg is swelled in the hock joint and the joint seems to be very sore, and he wants to lie down all the time, and I have to wake him to get up every time I want him to suck. Otherwise he seems to be all right. He sucks good, and looks fine, and is not swelled about the body or navel. I am treating him for rheumatism. Would like to know what is the trouble and what to do for it. He has been in this condition ever since foaled.—Illinois Subscriber.

REPLY—There are several things that could produce the condition mentioned, and you may be right in your idea that it is rheumatism. Also it might have been brought about by some injury, and still further, may be a result of some navel infection, even though no local swelling or other disturbance is in evidence at the navel. The thing most needed is to give attention to the local inflammation at the hock and one of the best things that can be done at this particular time is to apply a good, big warm antiphlogistine pack to the entire hock and keep it in place by means of a bandage, which must be very carefully bound about the part. This should be renewed twice a day and the application should be kept up for three or four days. Follow this with a liniment composed of soap liniment four ounces, alcohol six ounces and distilled extract of witch hazel six ounces; apply two or three times a day.

WORMS AND LICE—I would like to ask what to do for worms and lice on young horses. I have never seen so many infested horses in my life.—Illinois Subscriber.

REPLY—In the case of worms we have found that a brick purge is one of the most effective ways of ridding the bowels of horses and colts of worms. For this purpose barbadoes aloes is one of the best agents. A horse may be given an ounce of the drug and colts in proportion, depending on age and size, in the form of a bolus or it may be given in drench, dissolved in a little warm water. As a rule when horses are turned to a fine growth of grass such as usually abounds over the country at this time, sufficient physicing is induced to produce the desired effect without the use of the purge. What few worms remain after the treatment may be destroyed by giving a level teaspoonful of dried sulphate of iron in the feed three times a day. This is the dose for an average size horse. Numerous agents are used to destroy lice, including decotions of tobacco, creolin solutions and lime and sulphur preparations. We have never found anything quite so effective as the kerosene emulsion preparation, the formula of which has appeared numerous times in this paper. It has the effect of ridding the animal of not only the lice present, but prevents the hatching of the eggs.

SEMEN FROM THE UTERUS—In taking the semen from the uterus, is there enough left in for that mare to get with foal, or do you have to use a capsule on her?—Nebraska Subscriber.

REPLY—It is better to put a cap-

(Continued on page 26.)

Our Harness Horse Talk

Hot-House Tendency as Evidenced in Big Money Offered to Early Speed. Trotters That Have Responded to This Call and Made Good.

Written for The American Breeder, by Henry Ten Eyck White.

Of late the trend of breeding operations, so far as the light harness horse of America is concerned, has been almost wholly in the direction of producing early speed, no matter what other qualities in horseflesh must be sacrificed to that ambition.

Result: the establishment of so many and such rich stakes and purses for 3-year-old trotters that a champion of that age any season which outclasses all the others, is well trained, and well driven has the possibility of winning over $50,000 worth of events —or in other words, more than any aged trotter ever has won in a single campaign, the high water mark for the mature ones being around $32,000. Naturally not only is the endeavor to breed trotters capable of winning stakes at three years going to be continued with greater fervor than ever, but as the supply of fast colt trotters increases—as it annually does—the tracks are quick to respond by offering fat money prizes for races at that age. A few years ago a grand circuit meeting with a 3-year-old race was a rarity, and the 2-year-olds never dreamed of starting until late in September; now they are ready to trip off miles in 2:15 or better the first part of July if anybody will suspend the currency from the wire.

It occurred to me that a very interesting lot of information for breeders and horsemen generally lay concealed in the list of stallions and mares that have trotted into the 2:10 list when 3 years old. So I looked it up and give below a list of such equines. It is possible one or two may have been overlooked, but not probable. The stallions, and the sire and the sire of the dam of each is given, so the main blood lines may be seen at a glance.

Colorado E., 2:03¾; sire, The Bondsman; dam's sire, Jay McGregor.
Gen. Watts, 2:06¾; sire, Axworthy; dam's sire, Prodigal.
Atlantic Express, 2:08¼; sire, Bellini; dam's dire, Electioneer.
Mainleaf, 2:08¼; sire, Mainsheet; dam's sire, Ashland Wilkes.
Justice Brooks, 2:08½; sire, Barongale; dam's sire, Autograph.
The Harvester, 2:08¾; sire, Walnut Hall; dam's sire, Moko.
Kentucky Todd, 2:08¾;sire, Todd; dam's sire, Parkville.
Binvolo, 2:09¼; sire Bingara; dam's sire, Kremlin.
J. M. Forbes, 2:09½; sire, Bingen; dam's sire, Grand Sentinel.

There are nine of these stallions that took records under 2:10 as 3-year-olds, and as usual in cases where the standard is a certain rate of speed there are other horses that, under the law of equity, should be considered with them, but which nags unfortunately did not officially trot in 2:10 or better at the age named. Arion is the most striking instance of the possible injustice of such a rule. He took a record of 2:10¾ at 2 years of age to a high wheel sulky, a performance never approached by a colt of the age to that hitch. At 3 Arion trotted in 2:10½, and eventually in 2:07¾, but his 2:10¾ as a 2-year-old to high wheels is unquestionably better than 2:10, or a shade better at 3 to the bike hitch.

Bingen would easily have taken a 2:10 record at 3 had he been pointed for the effort, as he trotted a public exhibition at 2 in 2:12½. Cresceus at at 3 won the fastest eight-heat race on record, beating aged horses and doing one of his miles better than 2:12, a certainty that is better than 2:10 against his own age, in a small field, especially as Cresceus took the sixth, seventh and eighth heats. Admiral Dewey, ultimate record 2:04¼, made when he could not be properly trained, won a race at 3 in 2:14¼. He could have beaten 2:10 way off that year had his bad leg stood the work. Billy Burke, present record 2:03¾, trotted a public mile at 2 in 2:10¾, and another at 3 in 2:07¾, but was too unreliable to get a mark in his races. Bob Douglas was marked in 2:12¼ his first start as a 3-year-old and then took sick. Peter the Great won his only start, the Kentucky futurity, as a 3-year-old in 2:12½, but that he could have beaten 2:10 had there been anything in the race to prompt him, was patent. Todd gave an exhibition at Boston when 2 in 2:21, the last half in 1:07, but was too lame to be trained at 3. So don't forget those that fell outside the breastworks and are not recorded in the general muster, and when a stallion gets colt trotters of class look him up, if he is not in the list of notables, and you generally will find he was a colt trotter of merit just the same.

These nine stallions that went in 2:10 or better at 3 are mostly too young to show whether or not they are sires, but Kentucky Todd and Binvolo already have "arrived," as the French say, and it should be mentally noted that they are of the Bingen strain, one being by Todd and the other by Bingara, both sons of Bingen. J. M. Forbes had a yearling in training last summer that could trot a quarter at better than a 2:30 gait, and I am told by a Denver man that the yearling by Colorado E., and out of Dorothy Axworthy (that was beaten only a head as a 2-year-old by Trampfast in 2:12¼) is a hummer and up to a quarter in :37 right now. Mr. Geers told me not long ago he had a Harvester yearling that impressed nim as much as anything of the age he ever pulled a line over—and that means much.

Now, if present principles of breeding be not wholly amiss in their teachings it is from the fast young stallions and mares of successive generations that most of the good colt trotters will come. Gen Watts, holder of the 3-year-old record until Colorado E. came along, was by Axworthy, colt trotter, 2:15½ at 3; son of the colt trotter, Axtell, 2:12 at 3 to high wheels. Colorado E. is by the colt trotter, The Bondsman, up to a mile in 2:12 at 3, and he was by Baron Wilkes, colt trotter, etc. And this is the theory on which the most progressive breeders are banking their hopes, the one mare man, under this system, having just as good a chance as the big fellow. At the present time there is not history enough in the way of colt trotting to throw light on some angles of the problem, but right now it would seem that at the age named and the rate of speed taken as a standard, the fillies are more apt pupils than the colts, as not only was Fantasy, daughter of Chimes, far in advance of all the 3-year-old colts in beating 2:10, but to date 13 fillies are in the select band as compared with 9 colts. Their names and blood lines are:

Native Belle, 2:06¼; sire, Moko; dam's sire, Gen. Wellington.
The Leading Lady, 2:07; sire, Bingen; dam's sire, Heir at Law.
Czarevna, 2:07¼; sire, Peter the Great; dam's sire, Onward.
Grace, 2:08; sire, Peter the Great; dam's sire, Onward.
Baroness Virginia, 2:08¼; sire, Baron Review; dam's sire, Jay Bird.
Margaret Parrish, 2:08¼; sire, Vice Commodore; dam's sire, Arion.
Soprano, 2:08¾; sire, Bellini; dam's sire, Elyria.
Miss Stokes, 2:08¾; sire, Peter the Great; dam's sire, Guy Wilkes.
Fantasy, 2:08¾; sire, Chimes; dam's sire, Hamlin's Almont.
Lou Billings, 2:08¾; sire, J. A. McKerron; dam's sire, Sidney Dillon.
Grace Bond, 2:09¼; sire, The Bondsman; dam's sire, Ashland Wilkes.
Susie N., 2:09¼; sire, Moko; dam's sire, Wiltwood.
Miss Adbell, 2:09¾; sire, Adbell; dam's sire, Socrates.

As in the list of colts given above there are some very suggestive facts in this tabulation. Peter the Great, a futurity winner, has three in his list of fillies—almost one-fourth of the whole number. Moko has two, and had Fereno been put to her trumps the day she won the Kentucky futurity in 2:10¾ he would have three. But, on the other hand, had not Sadie Mac, daughter of Peter the Great, been given a wet and heavy track on which to perform when her futurity was trotted she assuredly would have gone in 2:10, as at Hartford, several weeks previous, in a winning race, she was very easy at the end of a mile in 2:11½ over a mealy track.

The Bondsman sired two of the above fillies, and his work as a colt trotter has been refered to. J. A. McKerron sired one. He was the fastest 3-year-old stallion of his day, 2:12½ with indifferent training and driving, and then, in new hands, he went on and won at matinees until he had the stallion record to wagon in the amateur field, and finally took a record of 2:04½ when very lame—which fact I have on the authority of Mr. H. K. Devereux of Cleveland, who owned the stallion and drove him the trial. "He was so lame I would not ask Tanner (the stallion's trainer) to get up behind him," was the way Mr. Devereux put it.

And then there is Adbell, which "makes" the list through his daughter, Miss Adbell, and her mark of 2:09¾ was made in the course of winning the Kentucky futurity. After that heat the rest of the trip was easy for the mare, but as it then was uncommon for a 3-year-old to beat 2:10 and it so happened that Miss Adbell did not start again as a 3-year-old, or at 4, there was an impression among horsemen that her futurity mile was her limit.

Now, as a matter of fact Miss Adbell was a good deal better 3-year-old than even her 2:09¾ indicated, as in talking about the mare in later years McDonald said to me he put the filly into winter quarters the year she won the futurity with the firm belief she was the making of a great race horse, and moreover that she was a shade better 3-year-old than Sadie Mac, which he trained and drove to her 3-year-old mark, she being unbeaten at that age. After Sadie Mac, known to be the champion of her year, and about as good a 3-year-old as up to that time had appeared, had won the Kentucky futurity and finished her campaign, McDonald gave her a tryout at Lexington of a single mile with a fast eighth at the finish. That mile was in 2:16, last eighth about :15. That was in 1903, and in 1905 when Miss Adbell won the big stake for McDonald he tried her the same way. Her mile was in 2:14½, if I remember correctly, and the last eighth was :14½, which made McDonald rate Miss Adbell the best trotter he had held the lines over.

So all the way through the above lists of champion race horse 3-year-olds is woven the thread of early speed on the part of sires as well as of the children, and Adbell who was a champion yearling with a mark of 2:23, is but an example, as are Bingen, Peter the Great, McKerron, The Bondsman and Chimes, the last named being a 2:30¾ trotter at 3 years to high wheels. Even Moko was a colt trotter, although commonly not known as such. As a 3-year-old he worked the Cleveland track in 2:25 for Ed. Benyon, but a slight injury stopped his training, and after his first crop of foals came they looked so good to the stallion's owner he kept the horse in the stud, not caring to take the risk of shipping him while in training.

The figures in the case assuredly indicate that it is the young trotters of the future, which is nature's law, despite the fulminations of many men who argue the improbable—that a slow horse will sire more fast ones than a fast horse will.

BREEDING TERMS

In our issue of April 5 appeared a letter from Charles Jordan of Wabaunsee county, Kansas, asking for the ideas of other readers as to breeding terms which would prove fair and satisfactory to stallion owners and mare owners alike. From among the replies to his letter we have selected the following to print:

To the American Breeder: In regard to Mr. Jordan's question, would say that the man who breeds the mares should pay the service fee, as he is the one who went in debt for it. He bred under the condition if mare is sold, traded or moved the service fee must be paid.

There are a number of men in my district who will breed a mare to a good stallion or jack in order to sell and get a good price. If the stallion owner wants to collect the fee they tell him the mare was not in foal, and to the one who bought her they will say the mare was sure in foal, and neither one of them wants to pay. Therefore I think cash will be the best.—Jacob Maurer, Montrose County, Colorado.

To The American Breeder: In looking over The American Breeder we see an inquiry from Mr. Charlie Jordon. Here is what we think are good terms for both parties, and the way we stand our imported stallions —$15.00 to insure a two weeks' old colt, and should your colt die before it is two weeks old, service fee becomes due and you have the privilege of returning your mare until you get a colt older than two weeks. Or in Mr. Jordon's case it might be put, $15.00 to insure a colt to stand and suck. Should the colt not stand and suck, service fee becomes due, or when mare is sold, traded or removed from the county, with privilege of returning mare until you get a colt that stands and sucks. We think these are both very fair terms to both parties. What do others think?—S. D. Bryant & Sons, Lorain County, Ohio.

To The American Breeder:—Having had quite a bit of experience in horse and mule breeding, both as mare and sire owner, I may be able to offer a few suggestions that will be of benefit to Mr. Jordon, of Kansas, and perhaps others.

I fully realize that a stallion owner if he holds his customers, must make them satisfied, not only as to quality of colts, but they must feel that they are getting a square deal. I know, too, that sometimes in order to meet competition (and sometimes of an unscrupulous kind), they are tempted to make terms contrary to their better judgment, but I can't for the life of me see how any man with a stallion or jack worth charging anything for at all, will agree to stand good, as far as his own business is concerned, for the misfortunes, accidents, ignorance, carelessness and often cussedness that will inevitably be scattered more or less among even the best class of patrons, by insuring colts to "stand and suck." It looks to me like just common sense that after a person has put up good money for a stallion or jack and qualified himself to handle them properly, that after a mare is safe in foal, the stallioner and stallion have performed their part—have done all they can do, and the stallioner has no further control or supervisions of the mare. Whether there is ever a colt to "stand and suck," now depends wholly on the mare owner and the mare. Let them do their part or be responsible for the future.

One of my rules that has done much to hold my patrons, and make them feel that they are getting something for their money is: When a mare is insured in foal, and with reasonable care there is a misfortune with the colt, I breed the mare back free.

We have no stallion lien law in this state, so I make the agreement with the man who breeds the mare, and look to him for its fulfillment. If he disposes of her and she goes out of the neighborhood, he must furnish proof that she was not in foal or pay the bill.—L. Current, San Juan County, New Mexico.

COLT SCOURS.

Colt scours should always be prevented if possible instead of depending on curative treatment. The cause of the trouble lies usually in some fault of the owner in the management of the dam. The chief trouble is in the manner in which the mare is fed. Mares that are kept for brood purposes are usually required to work and while being worked are fed too much and too heating food for the good of the colts. Many mares are such heavy milkers that it is difficult to keep the flesh on them without overtaxing the colt's digestion with the rich flow of the milk induced by strong grain rations. All these things should be carefully studied by the mare owners and the dams handled in a way so as to prevent scours as these young things do not withstand a severe attack of indigestion very well. Inasmuch as colt scours in the most cases is primarily indigestion it is well to give a dose of castor or olive oil first (one or two ounces, depending on age and size of colt). Use such agents as whisky to keep up the strength of the colt with subnitrate of bismuth or prepared chalk to allay the irritation of the bowels. Small doses of laudanum may be given if the discharges become watery and there is much straining, but one should be careful not to check the bowels too quickly. Always be careful that the colt is kept in a warm sanitary place with proper exposure to sunlight.

CASH PRIZES FOR BELGIANS.

We are informed that the Belgian Herd Book in Belgium wishes to give cash prizes at the different state fairs this year instead of giving cups, as the duty would be too expensive on cups. Secretaries of all horse shows should write Societe le Cheval de Trait Belge, Chevalier G. Hynderick, secretary, 20 Rue Royle, Brussels, Belgium.

MARE HAS HAD 16 COLTS.

To the American Breeder:—I noticed in your issue of February 20, 1912, your record of two brood mares as good producers. William Fetzer of Lewisburg, Union county, Pa., R. F. D. No. 2, has a black Norman mare 20 years old; weight about 1,350 pounds, that has produced 16 colts, and carryrying her seventeenth one, of which this mare has raised 14 good sound colts. She has always been in the harness at farm work. The last two colts she raised and the one she is now carrying are sired by my stallion. He weighs 1,700 pounds. There are none better in any way as a drafter. He works in all harness any time or place as a gelding would.—Murray A. Miller, Northumberland county, Pennsylvania.

The final figures in the live stock wealth of the United States give it as $5,008,149,000. These figures were given out January 30 by the National Department of Agriculture in a statement giving the combined number of horses, mules, cattle, sheep and hogs on the farms and ranges of this country, as 200,601,000. These figures are based on the reports to headquarters dated January 1. This means an average value, per hoof, for all kinds of stock of about $25.

How the Capsule System Works

A Few Letters From Practical Men Who Have Demonstrated the Superiority of This Modern Breeding Method.

To the American Breeder: I have had good success with the capsule system. In fact, I think it the only sure and safe way to breed.—C. A. Flint, Rooks county, Kas.

To the American Breeder: I find the capsule system to be all that is claimed for it. Have been successful in settling mares that had been given up as non-breeders.—C. C. Fisher, Lee county, Ill.

To the American Breeder: I have used the capsule system for two years. I have had fair success. Have got mares in foal when bred out of heat; also got mares in foal that had failed to settle by natural service. Would not be without it.—J. J. Adams, Tulare county, Cal.

From 137 Capsule Services, 110 Colts.

To the American Breeder: I have been very successful with the capsule breeding. I bought a horse in addition to my other stock and I bred 137 mare; got 110 mares in foal and got pay for 100 colts at $15 apiece. This is the best I ever did with one horse. They were all bred with the capsule system. I have been in the breeding business for 18 years.—G. W. Nickerson, Harrison county, Mo.

Convinced Those Who Doubted.

To the American Breeder: I used the capsule system last season for the first time and had good success. I settled mares with capsules that could not be settled with a stallion or jack. Now I have several customers that have spoken for the capsule system for the coming season, and several of them have been breeding to other horses that have asked me if I would use the capsules they would be over with their mares. I convinced some who had no faith in it at all before, and now they are my best advertisers.—Frank O. Peterson, Montgomery county, Iowa.

Made Producers of Barren Mares.

To the American Breeder: In the two years that I have practiced the capsule system of breeding I have been more than pleased. I have had no trouble in settling breeding mares and I have made breeders of a great many mares that had never been in foal from a natural service. The fact that I am the only breeder in the county who practices the capsule system of breeding has caused a great many now breeding mares to be brought to me from out of my natural district, to try the capsule system. They have come as far as 20 miles in order to have me breed their mares.

The first mare that I tried the capsule on was my own mare. She was 8 years old, and while I had bred her every year from the time she was a 2-year-old, she had never been in foal. The second time I bred her with a capsule she settled. When she was three months along she ran away, was thrown down and the shock caused her to lose her colt. When she was again in breeding condition I bred her in the natural way and she settled the first service and brought a fine colt. She gave no further trouble. Another case was that of a driving mare 9 years old. She had been bred every year since she was a 3-year-old and had never been in foal. I examined her and found her womb abnormally small and turned to one side. I bred her with a capsule and she settled the first time. Another mare 8 years old that had been bred since a 3-year-old without getting in foal. On examination I found her womb to be contracted and turned to one side. She brought a colt from one breeding with a capsule. Another case of two mares belonging to the same man. After failing to breed naturally were brought to me to be bred. They were bred with a capsule and on the 21st day both were returned and proved to be in heat. I bred them the second time and both brought colts.

I have bred as many as seven mares at a single service and settled five of them. The above are only a few of many similar cases of my two years' work with the capsule system. I have settled fully as many of the breeding mares bred with capsules as natural, and have made breeders of a large per cent of mares that never had and never would have brought colts from a natural service.—E. L. Pitzer, Pratt county, Kas.

A Pioneer in Capsule Use.

To the American Breeder: I have been breeding mares for several years with capsules. I will tell you how I first bred with capsules. I got a nice little pan, and when the cover was made as the stallion or jack came off, I would drop his tool in the pan, catch enough semen to fill two or three capsules. I have one mare here at Le Loup that has got three mule colts. This mare was never bred naturally; all three of these mule foals were got by filling capsules caught from this pan.

Last year I bought a big Percheron stallion from the Percheron Importing Company, and the mares came in so fast I could not breed them all from the catch in the pan, so I sent and got the Carlson Semen Extractor, also a box of 100 capsules, and I soon found that this was better than catching in the pan, from the fact that I could breed four or five at one time. And I must say that the capsule is the most sure way to breed any mare. I have a large Mammoth jack; his weight is 1,200 pounds, and I breed jennets from all parts of the state, and I seldom ever let him see one. I just breed a mare, get the semen and fill the capsule and breed the jennet. This is the only way to breed a jennet and you will never spoil a jack.—C. F. Johnson, Franklin county, Kas.

ONE WAY TO KILL A HORSE.

An exchange of Puyallup, Wash., the home of Ezra Meeker of Oregon trail fame, tells how the old man had a narrow escape from death recently, all because he is tender hearted.

A horse that for thirty years had been a faithful farm animal on Meeker's ranch was in a precarious condition. Meeker decided to destroy the horse painlessly. He went to town and bought two sticks of dynamite, caps, and a bit of fuse.

He tied the explosive to the horse's neck, inserted the caps, and attached the fuse. When all was ready the fuse was lighted and Meeker ran for the orchard, 100 yards away, as fast as his 79 years would permit.

The old man had not gone far when, hearing a noise behind, he turned to behold the old horse following him at a brisk trot. The animal was frightened at the sizzling fuse dangling from its neck and sought protection at the hands of Meeker.

Meeker realized his danger and ran faster. A barbed wire fence separated the orchard from the pasture and this the old man hurdled like a deer. The horse stopped at the fence and then something happened.

The farmer, with his clothes in shreds, found himself in an apple tree. The old horse had vanished, as had about fifty yards of the wire fence.

HOW TO PROVIDE BALANCED LIVE STOCK RATIONS.

To the American Breeder:—Feeds are divided into two great classes—those that are concerned with growth and are used to build up muscular tissue, and those that are used to produce heat and energy and are the principal sources of animal fat. The former are called nitrogenous feeds, the latter carbohydrate feeds. Examples of the former are soy bean meal, oil meal, bran, shorts, alfalfa, clover and other legume hays, tankage, field peas, cotton seed meal, etc. Carbohydrate feeds include corn, wheat, barley, rye, root crops, silage, straws, etc. Oats are more nearly nitrogenous.

Animals differ widely as to the kind of feeds they can use to best advantage. Young and growing animals need to build bone, muscle and tissue, and therefore require a rather high proportion of digestible nitrogen. Fattening animals have to a great degree accomplished the necessary growth of bone and flesh and are ready to utilize feed adapted to the storage of fat. Carbohydrate feeds are better suited to this purpose. Dairy cows require feed for maintenance of the body functions and for supplying the fat and nitrogenous matter found in the milk. In addition to grains and pasture, hogs need supplementary feeds such as charcoal, wood ashes, tankage, etc.

In short, a feed must be fitted or adapted to the needs of the animal. When a ration is so fitted or adapted it is called "balanced." A man feeding corn alone to growing pigs is not feeding economically. The young pig cannot use to advantage a ration so strongly carbohydrate and will of necessity fail to develop fully in vigor and strength of bone and muscle. The horseman who feeds alfalfa hay, and alfalfa alone, to his brood mare is feeding too high a proportion of nitrogen. To handle and eliminate through the kidneys this unusually large quantity of nitrogen is too severe a tax on a pregnant mare and is liable to result in the foaling of a defective colt. The brood mare needs a variety or balanced ration. In the same way the steer, the sheep, the brood sow, and in fact all classes of animals require rations adapted or balanced to their needs.

A pig five months old requires one pound of digestible nitrogenous feed to five pounds of digestible carbohydrates. A ration can be so balanced by using two pounds of shorts, one pound of corn, three-fourths pound of barley, and one-fourth pound of tankage. A pure bred Poland China barrow so fed on the University Farm weighs 265 pounds at seven months.

A 1,000 pound dairy cow requires seven-tenths pound of digestible protein, seven pounds of digestible carbohydrates, and one-fourth pound of digestible fat for maintenance. When producing 25 pounds of 3 per cent milk she needs in addition to her maintenance requirements one pound of digestible protein, four and three-fourths pounds of digestible carbohydrates, and four-tenths pounds digestible fat for sustaining the milk flow. This result can be accomplished by compounding a ration of four pounds of ground corn, three pounds of rolled barley, seven pounds of alfalfa hay and 31 pounds of corn silage.

By similar processes balanced rations can be calculated for other classes of animals. Standard and modern books that fully explain the nature and value of the various feedstuffs in common use and that fully explain the compounding and balancing of rations are as follows:

"Profitable Stock Feeding," by Prof. H. R. Smith.

"The Feeding of Animals," by Prof. W. H. Jordan.

"Feeds and Feeding" (revised edition), by Prof. W. A. Henry.

"Feeding Farm Animals," by Prof. Thomas Shaw.

"Elementary Treatise on Stock Feeds and Feeding," by Prof. J. E. Halligan. (A new book.)

Farmers' Bulletin 22 on the "Feeding of Farm Animals" contains a discussion of feeds and feeding and extensive tables for us in balancing rations. This publication can be obtained by writing the U. S. Department of Agriculture, Washington, D. C.—E. J. Iddings, Animal Husbandry Department, University of Idaho.

THE BEST BEEF BREEDS.

There are about twenty-five distinct beef breeds of cattle. Each of these are claimed by their followers to be the best. Strictly speaking, beef cattle are intended for beef only. A careful study of beef cattle at the leading markets does not show any call for any particular color or fashion of breeding, but are sold for so much per pound, which varies according to the quality and condition of the animal. Two animals may be found in the same feed lot and one of them bring 4 cents per pound and the other double that amount. The better quality will dress out a greater per cent of the high-class cuts. The animal with better quality usually receives full benefit of all nutriment taken, which is a great saving in high-priced feed. A greater outlet for beef cattle is rapidly calling for the farmers' best beef cow, that is for a cow that will give a reasonable amount of milk, raise good calves without a nurse cow, fatten easily and rapidly and when sent to the market bring a good price. Owing to the large per cent of high-priced cuts, the market should be used more as a standard among the producers of pure-bred beef cattle. During the dull times most breeders have weeded out their inferior stock at butcher prices. Those that have remained are very high class as a rule. It matters not so much what record an animal may be registered in as that the individual and breeding is of the best and an improvement in that breed. The point we wish to emphasize is this: that the particular characteristics of some particular breed is not the principal consideration in developing the better live stock.

AT AN ENGLISH EXHIBITION OF MILKING SHORTHORNS—A TYPE OFTEN ADVOCATED FOR FARMERS ON HIGH-PRICED LAND.

BLACKLEG AND ITS TREATMENT.

To the American Breeder: Blackleg is a disease restricted almost entirely to the bovine family. It is caused by a definite bacterium or germ which generally attacks some one quarter of the animal, producing there a rapidly developing enlargement. The disease generally terminates fatally in a few hours. The infection causes the meat of the diseased quarter to turn black with a large production of gas just under the skin. Hence the name "blackleg" or "quarter evil." One of the best diagnoses is to pass the hand over the swollen quarter and detect the gas under the skin. In true blackleg the skin will rattle like paper when thus rubbed.

There is little that can be done to cure the disease when it has manifested itself in the animal, but the rest of the herd can be successfully protected by the use of blackleg vaccine. In those regions where blackleg is prevalent it is the common practice to vaccinate each spring before turning upon the range all cattle from six months up to and including three years. The peculiar thing about blackleg is its infectivity for young, fat stock. The fattest and apparently strongest are first to succumb.

The vaccine is made by the United States government and the State Ex-

PUBLIC SALE

ABERDEEN ANGUS CATTLE

LA PLATA, MISSOURI, MAY 16

27 Head, 14 Bulls and 23 Females

Lord Roberts 3rd 95565 is the sire of most of them. He is one of the best sires in this country. Bulls 12 to 20 months old. 15 cows with calves at foot. All others safe in calf. If you want honest cattle, buy in this sale.

E. M. GATES, LaPlata, Mo. Col. Geo. P. Bellows, Auctioneer.

ABERDEEN ANGUS BULLS

and a few choice females from 15 to 30 months old. No better individuals. No better bred. Close to city. Can be easily inspected. Address George Stevenson, Jr., Leslie-Orear Bldg., Kansas City, Mo.

Capital View Herd of Registered Galloways

For Sale: A fine lot of young bulls in numbers to suit purchaser. For further particulars call on or write

G. E. Clark, 2301 Van Buren Street, Topeka, Kas.

FOR SALE OR TRADE FOR HORSE OR JACK.

Seven head of registered Galloway cattle to trade for a registered Percheron horse or jack. Would consider a trade for a registered Percheron mare. Don't want anything over seven years old. Address, C. E. & F. W. Madsen, McDonald, Rawlins County, Kansas. R. F. D. 2.

FOR GALLOWAY CATTLE and OXFORDDOWN SHEEP, see Maple Grove Herd

where the prize winners are bred. Undefeated "get of sire" for 3 years in succession. C. S. Hechtner, Route 3, Chariton, Iowa.

PURE BRED GALLOWAY CATTLE.

For Sale—Ten bulls; one 5 years old; one 3 years old; one 2 years old. Seven yearlings. Nine cows, from 3 to 10 years old. Six 2-year-old heifers. Four yearling heifers. These cattle are all well bred and in nice condition; not a cull among them. Address, James P. Milliken, Media, Henderson County, Illinois.

For Sale

A herd of registered Hereford cattle, consisting of 15 females and double-standard Polled bull; part are Polled. Also 5 steers. Low price; must sell. C. Bordwell, Batavia, Clermont County, Ohio.

Seventy-five Registered Hereford bulls, 12 to 18 months old, for sale, singly or in car lots, at moderate prices. Duroc sale of 45 head bred sows and young boars at farm, May 9th. Samuel Drybread, Elk City, Montgomery County, Kansas.

BUENA VISTA HEREFORDS

Paragon 12th 29116 and Rex Donald 323493

Young bulls, cows and heifers for sale. In Service.

W. A. Dallmeyer

Jas. Shanks, Mgr. Jefferson City, Mo.

JOHN R. TOMSON, Dover, Ks.

My herd of Shorthorns are now at the home farm. Gallant Knight's Heir in service. Several good, strong, fleshy bulls ready for service now. Scotch and Scotch-topped.

Nevius' SHORT-HORNS and POLAND CHINAS

Good young bulls, reds and roans by our herd bulls, also few good boars ready for service. Write or come and see them. Mention this paper.

C. S. NEVIUS, CHILES, KANSAS

38 SHORTHORN BULLS

for sale. Twenty of these are around two years old. Will sell them by the head, or at 11 cents per pound (weight at Bucklin, after traveling 9 miles). For the 18 yearlings will take $85 per head, 15 of them are by my ton bull, Scottish Secret 285842. Cows and heifers for sale also. Gus Benson, Bucklin, Linn County, Missouri.

periment stations from the dried flesh of those animals dead of the disease. The meat is first dried, then ground up and made into a paste, then this paste is subjected to heat for several hours. The result of the heating is to weaken the organism causing blackleg, so that upon administering to the animal a mild form of the disease results, which thus protects it against the more severe infection. It does not require a vetinarian to administer the protective vaccination. Directions are sent out with the vaccine, which any one can follow. The only instrument needed is a cheap syringe with which to inject the suspension of the vaccine under the skin.

In case blackleg appears in a herd all the animals up to and including the 3-year-olds should be treated. Blackleg is more particularly a range disease, the cattle contracting it from the infected pastures. Millions of dollars are lost annually in the United States from this trouble, a large per cent of which can be prevented by the timely use of blackleg vaccine. All animals dying with this disease should be burned or deeply buried so that dogs cannot dig up the carcasses and scatter the infection.

The Idaho farmers can obtain the vaccine and directions for its use free of cost by addressing the Idaho Experiment station at Moscow. The farmer must furnish the syringe.—John F. Nicholson, Bateriologist, Idaho Experiment station.

BEEF CATTLE OBSERVATIONS IN EUROPE.

While beef cattle have been bred for many years in Europe, the importance of that type of animals apparently is not as great on the extremely high priced land as it is in this country. Certain sections of Europe pay more attention to their particular breeds of live stock than others. The Eglishman and the Scot must have the credit of producing the best beef cattle as well as some other classes of live stock. Shorthorns, Herefords and our two prominent black breeds in this country, as well as a number of other breeds originated, and were brought to high development, in the British Isles.

To the American, whose eyes are always filled with curiosity, it is often a wonder how so much valuable live stock can be produced on that little island of England and Scotland, between the Irish and English channels. This island is not as large as the Panhandle country of Texas, but it has more rainfall and has been inhabited longer. Considering the smallness of the country, the large amount of grass land and the large reserves owned by the wealthy class, one is certainly puzzled to know where the fine stock is produced that is exhibited at the many small and larger shows.

It is very expensive to thoroughly develop live stock in nearly any part of Europe. Much corn is shipped from here, and considerable oats and other feed. Help, however, is very cheap. A good farm hand can be employed for $2.50 per week. A foreman who is an expert receives about $5 per week. The land is made to produce more than one crop when possible—in fact, they have learned to make their land produce just as much as possible, and yet retain the fertility. The foreign trade has done much to develop the high class live stock in Europe. In other words, American money has placed a premium on high quality and made it profitable for those foreigners to furnish us with outstanding animals in years gone by. During the last quarter of a century other countries have been buying heavily from the European breeders. South America, and especially Argentine, as well as Canada, and even Australia, have been good buyers for the English products.

An interesting conversation took place at the recent Royal Agricultural Show. A group of English and Scotch breeders were asked what feature was the most profitable in high class live stock production, and nearly every breeder stated that it was his opinion that the most successful men in Europe owed their success and reputation largely as producers of excellent stock to one or more high class sires. It was interesting to hear these men tell about the different leading sires that had been famous with the leading beef cattle breeders, during the last half century. If an outstanding individual is of so much importance to these breeders, who live at the fountain head of the stock we are now using, why should not a greater value be placed on our outstanding sires, that have proved themselves such. The same conditions are surrounding the breeders in this country that have contributed serious problems for the breeders in the British Isles, excepting that we have not been handicapped by the smallness of the country. Here we have a large country much of which is yet undeveloped.

THE SEASON'S HOG AUCTIONS.

Public sales of hogs for the past season have been rather less representative of the Corn Belt than for several years. The reason for this is that comparatively few sales were held south of the line running east and west through Des Moines, hog cholera having resulted in cancelling a great majority of the dates claimed excepting north of this line. Fifteen representative sales of Poland China hogs showed an average of practically $50 for bred sows and bred gilts. Over 700 head are counted in this reckoning. The highest average made in any one sale was $100 per head for the sale of Pfander & Son of Iowa, and in this sale the highest price was $265. Most of the sales, however, averaged between $40 and $75. The only other breed in which enough sales have been reported to justify quoting averages is the Duroc Jersey. There have not been many more than half as many Duroc sales as Poland sales, but the Durocs seem to have held up slightly better in average than the Poland Chinas, 375 head of bred sows and bred gilts, selling at auction, having averaged slightly over $54. One of the highest single averages was $85, made by Thomas Johnson & Son of Ohio, and the top price in this sale was $605.

In nearly all of the more important Duroc sales tops of $100 and higher were realized. There did not seem to be a tendency toward higher sales as the season advanced, for the reason probably that in the latter sales there were more young things and more sows bred to farrow late.

HOG LOSSES AND SHORTAGE.

The very apparent scarcity in beef cattle is liable to make us lose sight, at least a part of the time, of a scarcity in hogs, which, while not nearly so serious because it can be more quickly overcome, is almost equally striking and just about as apt to result in sensational prices. Recently gathered figures indicate that the losses in breeding hogs the past twelve months were more than double the losses from the same class for the twelve months preceding. On top of this we have the unusual mortality among young pigs, resulting from unfavorable weather in March and the early part of April. Recovery from this shortage is bound to be slower than usual, for the very apparent reason that while feed remains high and pork is at a good price, many people will choose to continue selling breeding stock in preference to increasing their herds. On one hand they have the prospect of still better prices later on, but on the other hand there is still the chance of disease and a certain degree of uncertainty as to the coming crops. These conditions, favoring a rather slow recovery (as recoveries in hog population go), favor all the more the paying of extreme prices both for pork hogs and breeding stock later in the year.

The figures alluded to in the beginning include as the hog losses from disease 5,834,000 for the past year and 2,624,000 for the year preceding. The average annual loss for the past ten years is given as 2,967,000.

CONCEIVED BOTH HORSE AND MULE COLTS.

To the American Breeder: Gentlemen—I beg to report a case which has just happened and which may be of some value to some mare owner, as well as a stallion or jack owner.

A party, Mr. Bedford Ammons, who lives one mile west of here, bred to my jack a large mare April 14, 1911, and again on May 5, 1911. This mare apparently conceived the last cover as she went out and did not come in any more until along about the middle of July, when she was taken to a horse and bred. This ended the breeding of this mare and she died today, April 23. After her death she was cut open and had a fully matured mule colt; also a horse colt from the July service.

This same man brought another mare here last spring to breed, and, as I use the Capsule System, I always make an examination before breeding. In doing so I found this mare to be with foal, so we did not breed her.

I think this a strong point in favor of the Capsule System, as an examination by an experienced man, I think, would have shown the mare first mentioned to be with foal, thereby saving the mare's life, the stallion or jack service fee and a veterinary bill.—J. W. Timmons, Custer County, Oklahoma.

PLEASURE HORSES ENJOY GOOD TRADE.

Good prices have been paid for light harness horses and saddle horses in recent public and private sales. A 2-year-old stallion, Denmark Rex, bred by Paul Brown of St. Louis, sold to E. T. Castle of Pasadena, Cal., for over $500. Also above the $500 mark was the price paid for King McDonald, sold to Judge Alex Carter of Mexico, Mo. Following shortly after the stock show at Ft. Worth Texas, it is reported that Miss Loula Long of Kansas City had paid $1,500 for the light harness show mare Flossie, which had been exhibited at Ft. Worth by R. E. Hicks. Many profitable trades from $250 to $750 have been made since the first of the year.

WEDD & NEVIUS'

MAY POLAND CHINA SALE

WEDD'S FARM

Springhill, Kansas, Tuesday, May 14

45 Head, 18 Sows 27 Yearling Gilts 45

Wedd & Son sell daughters of Wedd's Expansion, Kansas Wonder and Silver Metal bred to Prince, a son of the 900-pound Prince Ito and Wedd's Expansion. Designer, Major Look, Good Metal and Forest Expansion are the sires of, and the boars to which the Nevius consignment is bred. A useful offering of immune sows and gilts bred for May and June farrow. Our catalogs tell the complete story, and if you are short on hogs, send for one and arrange to attend our sale. Address, mentioning The American Breeder.

GEO. WEDD & SON, Springhill, Kansas.

C. S. NEVIUS, Chiles, Miami County, Kansas.

COL. R. L. HARRIMAN, Auctioneer.

WALLACE'S MAY SALE

MAMMOTH POLAND CHINAS

ELLERSLIE FARM

BUNCETON, MO., WEDNESDAY, MAY 15TH

40—Yearling Gilts—40
By Expansion Wonder and Grand Leader, bred for May and June farrow to opposite boar.

10—Sows With Litters—10
Seven to eight pigs to the litter by Expansion Wonder and Grand Leader.

10—Choice Young Boars—10
Sons of Expansion Wonder, Grand Leader, A Wonder and Big Hadley.

In this offering there are as good as I have ever sold. The sows and gilts are a superb lot, more representatives of my two great herd boars than I have ever sold in a sale. There are herd leaders among the 10 boars. I would be glad to send you catalog and to entertain you on May 15th, at which time you can see my entire herd of 500 head. Address

W. B. WALLACE, BUNCETON, MISSOURI

Col. R. L. Harriman, Auctioneer.

LIVE STOCK PICTURES.

I make the best class of live stock photographs—suitable for making cuts or for framing. Drawings or paintings, if desired, but no cheap work. The leading live stock and farm papers of the country use my pictures. H. L. Ritchie, Mt. Washington, Mo.

STOCK AND ALFALFA RANCH FOR SALE—7 quarters deeded and 9 quarters leased land, all in one body. Good improvements; plenty of spring water. Land one mile to county seat. 350 acres of this land will grow alfalfa by sub-irrigation. Cut 5 crops last season. Only alfalfa proposition in this section. Can sell all the baled alfalfa you can raise at your door for from $16 to $25 a ton. Price $10 an acre for the deeded land. Address owner, W. P. Bailey, Springfield, Baca County, Colorado.

OUR MARKET REVIEW.

Did you ever see a market report which told what the prices would be the next day or the next week? A moment's consideration of this question will suggest the real relation of a good market review to the more frequent, but also more hasty, market reports which at first thought some are inclined to value more highly because of their lateness.

The fact is that practically all the market information we can get from the papers, be they daily, weekly or monthly, depends, for its value, upon the correctness of the idea it gives as to the course of the market for the time covered. A daily reading of hurriedly written market reports does not inform one so rightfully, as to the course of trade in the line he is following, as he would be informed by reading thoroughly, once every two weeks, a carefully prepared market review.

In studying the market, as in studying everything else, a better idea is gotten as to the relative importance of the influence which affect prices, if we study them at a little distance. The daily incidents of the market which are often mistaken as important at the time, often prove merely accidental and are found to exert no permanent influence and to represent no important factor. Many of the older market experts recognize the likelihood of misinterpreting the ups and downs of prices at the moment they occur, and usually withhold the expression of opinion as to the significance of these fluctuations, until after a little time has elapsed.

We are saying this much on the general subject of market reporting, partially in answer to a question which has been asked us several times, and partially for the new ideas it may give to some who, heretofore, may not have given the matter much thought. We have been asked if we thought it paid us to publish as complete and careful a market review as that which we offer twice monthly to our readers. We certainly think it pays and if there is any knowledge to be gained by studying market reports at all, there is no time thus spent which will give better results than the time spent in reading the review we offer. There probably is not presented in any other publication a market story in which every influence concerned is so nearly always given its proper importance. It is the work of an expert, prepared after a daily study on the ground; a careful reviewing of the transactions of each week and a careful comparison of periods, conditions and prices. Every condition of crops and commerce that bears on past or prospective prices is taken into consideration.

Many of our readers have noticed that we are giving them something on the market page which is altogether out of the ordinary, and have expressed both surprise and appreciation at the excellence of the department. We are writing this, however, in the belief that a great many, not realizing the possibilities of a real market review, are missing one of the very best things in the paper by limiting their attention to the market page to a mere study of prices.

SNOW WHITE HORSES.

There seems to be quite a few breeders of pink skinned, white horses, and as there is no well established breed of these horses it might be worth while for the breeders of this kind of stock to form a registry association. All those interested in this proposition can write to Wyatt Carr of Collins, Ia., whose letter follows:

To the American Breeder:—I see in your paper about white horses in Ohio. I have been a breeder of spotted horses for 40 years. Started with a white stallion. Now have 12 mares in foal. Often get a white one. Our herd stallion gets 5 per cent while out of solid colored mares. I have a one-year-old stallion, white as milk, with pink skin, that will weigh when matured 1,300 pounds.—Wyatt Carr, Collins, Ia.

OBLIGATION AND OPPORTUNITY FOR CATTLE BREEDERS.

To the American Breeder: The time is rapidly approaching when the farmers of the corn belt must find a new source of supply for cattle with which to fill their feed lots. The west and and southwest are gradually being divided into saller tracts of land and the business of the production of the feeder cattle in that territory is diminishing each year.

But with the ever and rapidly increasing population the beef supply must be increased. The apparent source of supply of at least an increasing part of our feder cattle in future years must be the farms of the corn belt states. With the condition must come further means of economy in order to make the remuneration satisfactory. Among these are the production of a better quality of cattle; an increase in the percentage of cows which regularly produce calves, and increased precentage of calves saved at birth. To bring about these conditions and to increase the profits in beef production in the future, a decided increase in the number of pure bred cattle of high quality will be required.

Nor will cattle breeders of the corn belt be called upon to furnish breeding animals merely to supply their own needs. A recent letter from the local officer of the Bureau of Animal Industry located at Memphis, Tenn., tells of the organization of clubs, societies and prize competitions in the south. Much interest is being shown in the improvement of quality and the increase in numbers of beef cattle in that section. Without doubt, in the future as in the past, the states of the corn belt will be the ones to furnish the breeding animals for that improvement.—E. A. Trowbridge, Department of Animal Husbandry, College of Agriculture, Columbia, Mo.

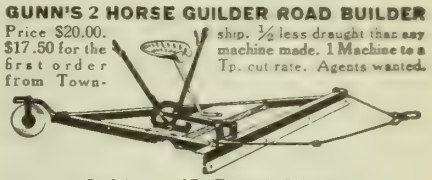
After years of experimentation we find we can grow Egyptian cotton in Southern Caliornia and bulbs in the state of Washington.—From the 1911 report of the United States Secretary of Agriculture.

GRAIN STOCKS LOWEST IN THREE YEARS.

The crop reporting board of the bureau of statistics of the United States Department of Agriculture estimates, from reports of correspondents and agents, that the quantity of wheat on farms March 1, 1912, was about 122,025,000 bushels or 19.6 per cent of the 1911 crop against 162,797,000 bushels or 23.6 per cent of the 1910 crop on farms March 1, 1911, and 166,214,000 bushels, or 23.4 per cent of the 1909 crop on farms March 1, 1910. About 56.1 per cent of the crop will be shipped out of the counties where grown, against 55.6 per cent of the 1910 crop and 61.1 per cent of the 1909 crop so shipped.

The quantity of corn on farms March 1, 1912, was about 884,069,000 bushels, or 34.9 per cent of the 1911 crop, against 1,165,37[illegible] bushels or 40.4 per cent of the 1910 crop on farms March 1, 1911, and 977,561,000 bushels, or 38.3 per cent of the 1909 crop on farms March 1, 1910. About 20.5 per cent of the crop will be shipped out of the counties where grown, against 22.9 per cent of the 1910 crop and 24.9 per cent of the 1909 crop so shipped. The proportion of the total 1911 crop which is merchantable is about 80.1 per cent, against 86.4 per cent of the 1910 crop and 82.5 per cent of the 1909 crop.

The quantity of oats on farms March 1, 1912, was about 289,988,000 bushels, or 31.4 per cent of the 1911 crop, against 442,665,000 bushels, or 37.3 per cent of the 1910 crop on farms March 1, 1911, and 365,432,000 bushels, or 36.3 per cent of the 1909 crop on farms March 1, 1910. About 28.8 per cent of the crop will be shipped out of the counties where grown, against 30.6 per cent of the 1910 crop

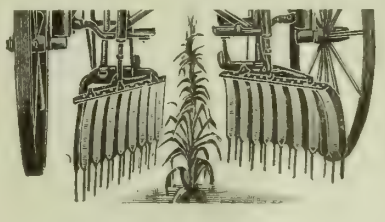


(Continued on page 31.)

TRACTION ENGINE FOR SALE.

Or will trade for good Mammoth jack. The engine is a 15-horse power Advance Traction. Torrens Bros., Glenwood, Pope County, Minnesota.

GUNN'S 2 HORSE GUILDER ROAD BUILDER



Price $20.00. $17.50 for the first order from Town-

ship. ½ less draught than any machine made. 1 Machine to a Tp. cut rate. Agents wanted.

Sold on 15 Days' Trial.
D. B. GUNN, Red Oak, Iowa.

RIDDLE'S PATENT CULTIVATOR GANGS. By their use you will grow better crops. The old style teeth destroy the roots, shortening the crops, leaves grow uneven, letting moisture escape. The gangs do not cut the roots, but make a fine dirt mulch that holds the moisture through severest drought. In use several years by leading farmers and adopted by large nurserymen. Tests made in 1908 for United States Department of Agriculture shows corn grew better worked with teeth like on these gangs. "One-third more potatoes cultivated this way, along side old way." Wm. Daylor, Baldwin, Md. "Used them on corn and potatoes, leaves ground fine and level, has paid me to have them." W. Lawson Groves, Nottingham, Pa. "Your gangs are O. K." J. W. Jenkins, Windsor, Va. "Have been using them several years, they are all right." Oscar Collier, Eaton, M. "Father likes them." R. L. Sharpless, Avendale, Pa. Others say: "They supply a long felt want." "Have been looking for something like them for years." "We know we are cutting the roots the old way." Prof. Alva Agee of Pennsylvania Agricultural College says: "Your gangs are all right, they are a good thing." Price per set, ready to bolt on to any riding or walking cultivator, $8.50; two sets, $16.50; three sets, $24.50. Check or money order. Price through dealers, $10.50. Gangs for one-horse cultivators, $6.50. W. H. RIDDLE, FORK, MD.

SAMPLE FREE

BROWN FENCE

15 to 35 cts.
Per Rod Delivered

You can examine Brown Fence and know just what it is before ordering or paying one cent. We mail you a sample showing size and quality of wire. When you get the sample, test it with a cold chisel and see how hard, tough and springy it is. File off the galvanizing and see how thick THAT is. All wires—both strand and stay wires—are No. 9 gauge, and made of the best grade of steel. Weighs ⅛ to ½ more to the rod than most fences, and will last [illegible] Price 15c to 35c per rod, and we pay the freight on 40 rods or more. [illegible] We [illegible] lowest wholesale prices—[illegible] Galvanized Wire Gates and [illegible] Save money by ordering [illegible]

THE BROWN FENCE & WIRE CO., DEPT. 124, CLEVELAND, O.

QUESTIONS AND ANSWERS.

(Continued from page 24.)

sule back in the uterus from which the semen was taken. Occasionally the semen will be taken from the vagina and none of it enter the uterus. In this way the mare served is sure of a complete service. What we mean by "complete service" is when the semen is deposited in the uterus. It is a good plan to make a practice of capsuling back the mare on which the natural service was made.

SEVERAL CAPSULES—Are two capsules put in a mare better than one, when you have plenty?—Nebraska Subscriber.

REPLY—One capsule will be as effective as several would be. In one drop of semen there will be so many spermatozoa that it is impossible to accurately count them all.

VALUE OF SEMEN—Is the semen in the vagina as good as that in the uterus?—Nebraska Subscriber.

REPLY—Semen deposited in the uterus is the cleanest, as a rule, and it does not come in contact with urine. Taking everything into consideration, we would say that the semen taken from the uterus is the best.

BREEDING ONE EXTRA MARE—If you have only one mare to breed with capsules, can you just take out a little of the semen from the mare that has been served with the natural service and leave the rest in?—Nebraska Subscriber.

REPLY—Yes.

COLOR OF SEMEN—What color and how thin is the semen?—Nebraska Subscriber.

REPLY—The color and thickness of semen is of little importance. There is only one way to tell whether it is fertile or not, and that is through the microscope. It is frequently said among stallion owners that the thick semen is the best; but that idea has little value. Some of the surest stallions and jacks we have ever known, have discharged semen at nearly every service that was as thin as water and looked nearly like water. The thickness of the semen depends largely upon the kind of feed that the stallion consumes.

BREEDING A "GILFLIRT"—Can you breed a "gilflirt" mare, and can she have a colt?—Nebraska Subscriber.

REPLY—All such mares should be bred with the capsule, as it is dangerous to make the natural service on them. Most of them deliver the fetus without difficulty, but occasionally at foaling time, a limb may come in contact with some of the lacerated parts and cause serious injury.

PROUD SERVER—Kindly let me know what the trouble is when a stallion mounts a mare, and by coming off, there is quite all the semen coming out when he dismounts. He don't stay on very long and the penis is still enlarged when he comes off. Any information as to how to remedy this will be appreciated. He is 10 years old and I have had him only a short time, so cannot tell whether or not the mares will settle.—Minnesota Subscriber.

REPLY—The fact that your stallion withdraws semen when he dismounts is an indication that he will get colts, provided the semen is fertile. The fact that some of the semen is withdrawn does not mean that he will be barren, as some of the semen is probably injected into the uterus on the breeding mares. We would suggest that you try this stallion with the halter, or, at least, have a very easy bridle on him, and encourage him to stay on longer. He may have been spoiled when young, which is the proper time to educate a stallion to stay on until the penis is withdrawn into the sheath.

THOROUGHBRED HORSES — In speaking of thoroughbred horses, will you kindly explain what kind it applies to? Also Standard bred?—Arizona Subscriber.

REPLY—The thoroughbred horse is the running horse, the oldest registered breed of horses in the world. They originated in England. All of the light breeds, except ponies, have originated from thoroughbreds.

Standard bred horses were registered under the performance rules, certain horses being able to trot or pace and establish a record which complied with these rules, were admitted as foundation stock.

MARE WON'T OWN HER COLT—I have a mare, coming three years old, that will not own her colt. I was by when she foaled, and rubbed the colt dry with some cloths that I had used on another colt, about three weeks before, and I let this mare lay for about three hours before she got up, and did not let her get her nose on the colt until she got up and then she wanted to kill it. It took four men to manage her, and we had to take the colt away. Is there anything I can do to make her own it Some say it was the cloth that I used on another colt, and some, that it is because I dried it before she got her nose on it.—Ohio Subscriber.

REPLY—You made a mistake by using the same cloth that you had used on another colt. Mares recognize their colts by the scent. When there is difficulty with mares not owning their colts, one front foot should be strapped up and a helper hold the mare by the head while the colt is brushed against her so as to have her scent. Then help the colt to nurse a time or two, after which there should be little difficulty.

RETURNING MARES FOR SERVICE—Will you please tell me what date will find a mare in heat after she has been allowed to pass over the ninth day?—Illinois Subscriber.

REPLY—If a mare is not bred on the ninty day after having a colt, the next period should be the twenty-first day after the ninth day.

COLLECTING SERVICE FEE—What course is best to take to make a party pay for a colt from the service of a horse? Says he has a good colt, but will not pay.—Kansas Subscriber.

REPLY—You should have filed a lien on the colt before it was foaled. This would have given you a lien on the colt until it was one year old. Since you did not do this, you can only sue the individual who bred the mare. If he has more property than the Kansas statutes provide for, you can collect for the colt.

CLOSED CERVIX—I am standing my jack and breeding my own mares. Upon examining one of my mares, I found the vagina very tight, and could barely get my hand through the membranes to the uterus. The neck of the uterus is about two inches long and so small around that I could only insert one finger, and could not push it back far enough to flatten it sufficiently to insert another finger. She is a valuable mare and has had foals; is 13 years old. We have no reliable veterinarian here, so please answer.—California Subscriber.

REPLY—Insert the hand into the vagina and work the cervix between the thumb and finger for a while; then insert one finger, which will open the cervix sufficiently to admit a capsule. This is all that is necessary. The cervix should not be opened any more than is necessary. There is no use to encourage another defect in the way of having the cervix too large.

SHY BREEDING JACK—I have a jack, 7 years old, in good fix, but slow to cover. He was spoiled two years ago by running with Mexican burros. I got him to serve a few mares last year, but he hasn't shown up any colts, and is not settling the mares this year, but is working fairly well. He don't get a great deal of exercise. Is it possible that he can't foal a mare? I have lots of work for this jack to do, and he does his work all right, but don't settle the mares. Any information will be appreciated.—New Mexico Subscriber.

REPLY—Test the semen under a microscope. This is the only way you can tell whether your jack is fertile or not without waiting a year. But it seems that you have waited a year.

STALLION SERVING—Have a 2-year-old stallion that appears to be anxious to serve and will mount a mare, but as soon as keeper takes hold of penis to guide, will shy and back off, refusing to serve. Is there a remedy for this fault?—Missouri Subscriber.

REPLY—As the stallion mounts, place the first three fingers of the left hand into the vulva with the back of the hand covering the rectum, so as to prevent him from making the wrong entrance. Do not touch the penis until he has made a few services; then you will have no more difficulty. In fact, this is the way all young stallions should be educated, then there will be very little danger of them making the wrong entrance.

BRAND ON NECK—What connection do the brands on neck have with pedigree numbers, if any?—California Subscriber.

REPLY—There is no connection between the neck brand on an imported horse and the pedigree. Most of the imported Percherons have brands. A few German Coach horses were branded. These are the only breeds that are branded in Europe.

HOOF NUMBERS—Will you kindly inform me how to connect the hoof numbers with the numbers on pedigree of imported draft horses?—California Subscriber.

REPLY—There is no connection between pedigree number and the hoof brand on an imported horse. The numbers are branded on the hoofs by the importer or breeder for his own identification.

DISINFECTING THE ARM—What is the best disinfector to wash your arm in after having it in a diseased mare, so that the next mare would not get the disease?—Missouri Subscriber.

REPLY—Nothing is as good as soap and water. This is all that should be used at any time. It is cheap and effective. Rinse the arm off with clear water after washing with the soap and water.

POOR SERVING JACK—Have a 7-year old jack. He has always been quick to serve, but this spring will get ready in a few minutes and mount the mare, but does not come up and enter. He will make two or three mounts before he makes the service. Sometimes he will make the service the first time and at other times will make from two to four mounts before he makes the service. He is in good condition. I feed him bran, corn and oats. Have never had trouble with him before. He runs in the lot all day and I put him in the stable at night. Can you advise what the trouble is?—Indiana Subscriber.

REPLY—From the conditions we would conclude that your jack has been caught in the pit and is afraid that he will have another accident. Or, he may be afraid of the bridle; when you serve the next time carefully slip the bridle off and use only the halter. Also, make an examination of the penis and see if there is irritation there.

If you do not find the trouble, put a day and night watch on him for 48 hours to see if he is masturbating. Be very careful with him, so that he will not be afraid of you.

BREEDING MARE BACK TO SIRE—Would like your advice as to breeding a mare back to sire, she not being related any other way.—Illinois Subscriber.

REPLY—Occasionally a breeder reports favorable results from this way of breeding, but as a rule it is not a success. If the sire has a defect it will be intensified just as strong as a good quality. For instance: If a sire is inclined to be curby, the offspring from this union may show that defect a great deal more than the sire does.

STALLION INSPECTION LAW—Is it necessary to have a Standard Bred horse examined when you don't bill him nor solicit business, simply breed what mares happen to come?—Kansas Subscriber.

REPLY—If your stallion serves outside mares for a consideration, he must comply with the Kansas state law.

SHY BREEDING STALLION — I have a large Percheron stallion, which is not sure. He is healthy and sound. Would you advise to try an impregnator? He has an exceptionally large and long penis, and gets some mares with foal. Is there any possibility of his semen being dead?—North Dakota Subscriber.

REPLY—Test the semen under a microscope; if it is found to show movement, we would advise using this stallion only three services a week and using the capsule system. This will give you an opportunity to make the natural service on a big tall mare—the only kind this stallion can make a complete service on, as a rule. The difficulty is that the stallion has such a long penis that he cannot complete his desire, consequently the smaller mares, having a short vagina, do not get in foal. It is quite likely that this stallion makes most of his discharge in the vagina, and the smaller mares, having a short vagina, are severely punished. This is the only solution for the stallion with extra long penis on short mares.

RHEUMATISM—Would like to know

Will Exchange for Percheron Stallions, black, deep virgin prairie land in the center of the Red River Valley, North Dakota. **Drawer C, Inkster, N. Dak.**

Royal Belgian Draft Stallions
AND MARES
IMPORTED AND HOME BRED.
For sale at very reasonable prices.
BLUE VALLEY STOCK FARM.
Blue Mound, Linn County, Kas.

FOR SALE—PERCHERONS AND MORGANS.

A fine large yearling black Percheron stallion, will mature a ton. Price $325. A handsome large bay 2-year-old Morgan stallion. Shows great style, action and lots of speed. Price $200. A black yearling Morgan filly. Price $125. All recorded and guaranteed sound and right. If taken within 20 days will sell at 20 per cent discount from the above last fall prices. Must sell to make room. **J. L. Buchanan, Sherodsville, Carroll County, Ohio.**

Stallions for Mules or Cash

A fine black registered Percheron stallion, 5 years old. Will sell reasonable or exchange for young mules from one to six years old that will weigh 1,200 or better at maturity. Big snap in this horse; guaranteed sound and a sure breeder. **A. D. Benton, Botna, Shelby County, Iowa.**

LESS THAN HALF PRICE TO CLOSE OUT.

Gamaleon (3) 2:25-2, sire of 27 in the list; son of Gambetta Wilks. Dam Lady Pepper, dam of nine in the list, daughter of Onward.

Imported Shire, prize winner at the Royal Horse Show at Kansas City; 1,800 pounds and as big and good boned one as you ever saw; coming 8, perfect in conformation and disposition; sound as a dollar.

A 14½-hand jack; light points. Not large, but a good boned fellow, that breeds large; 9 years old.

Yearling registered Percheron stud colt; black with small star, weighs around 1,000 lbs.; dam weighs 1,950 lbs.; sire weighs 2,000 lbs.

$1,000 will buy the bunch; no time for trifling letter writers. I want to close out and money is what I want. This stock will pay for itself twice in the next 90 days; I am busy manufacturing and selling the Gunn Guider Road Builder, advertised on another page of this paper, and must sell this stock.

D. B. GUNN, Red Oak, Montgomery County, Iowa.

ROBISON & AXTELL PERCHERON SALE

AT THE

Whitewater Falls Stock Farm

Towanda, Kansas

May 29, 1912

¶ Sale will consist of 40 head, 20 from the stud of J. C. Robison, Towanda, Kansas, and 20 from the stud of Dr. J. T. Axtell, Newton, Kansas, who is dispersing his stud at this time, as his other business demands all his time and attention. ¶ This will be the greatest opportunity ever offered in the West to secure brood mares and fillies. Mares are all bred. Many will have colts by their sides and be bred again. There will also be ten yearling and two year old stallions included in the sale. ¶ Many matched pairs, well broken to harness. They have been raising colts and corn.

Sale at the Robison Farm near Towanda, Kansas.
Write to J. C. Robison, Towanda, Butler Co., Kas., for catalog.
Auctioneers—J. D. Snyder, W. M. Arnold, J. P. Oliver.

some remedy for a coming 4-year-old mule. He began to act like he was sore in his shoulders, and now it is all over him. He eats hearty and tries to run and play, but can't get around very rapidly. This began to come on him about three months ago. He was worked hard at two years old and this year also. He is a large, rangy mule, but a very valuable one. I have quit working him for a while. —Illinois Subscriber.

REPLY—Inasmuch as mules and jacks are very subject to rheumatism we are inclined to think that your mule is thus affected.

Give him one-half ounce of salicylate of soda with one dram of nitrate of potash in his feed three times a day if he will eat it. If he refuses it in the feed dissolve it in a little water and give it by means of a hard rubber syringe. Avoid exposure during inclement weather by keeping in warm, dry barn.

RUPTURED COLT—What would you do with a colt that has a rupture? Or what would you call it on the side of his navel the size of an egg. He is nine months old. Has had it for six months.—Minnesota Subscriber.

REPLY—It is not likely now that your colt is nine months old that it is going to recover without some operation being performed. We cannot advise you to undertake a surgical operation of the kind needed to insure a cure of your colt and not endanger its life, and would advise that you consult a qualified veterinarian, whom you know has had a successful experience with this class of cases.

ENGORGED ON CORN—Can you tell me anything to do for one of my mares? She got out of the pasture one night and ate some corn and the next morning she was sick, and I thought she would lose her colt, as there was a sort of skin hanging from her. It looked like a part of the after-birth. But it went back and she is still carrying the colt, but she seems sick at times for five or six hours at a time. I can see the colt move when she drinks cold water, so it is still alive. She is due to foal soon. Will she be apt to carry the colt, and if she does, do you think it will be all right?—Kansas Subscriber.

REPLY—It is quite likely that as a result of the sickness which occurred from getting too much corn, that the palcenta has become partially detached and it may result in an abortion before the proper foaling time is reached. So long as you can note movement on the part of the fetus it is not advisable to do anything except permit the mare to remain quiet in a lot or box stall where she will not be molested by other stock. There has been cases where the envelopes became partially detached for some cause and the mare carried the foal to full maturity and delivered it alive. If it should appear that the colt is dead, and she does not deliver it herself, then she should have assistance at the hands of a qualified veterinarian. Keep her under close observation but do not meddle with her much.

BREEDING TWO-YEAR-OLD FILLIES—Is it advisable to breed a 2-year-old filly? Will it stunt her growth?—Illinois Subscriber.

REPLY—All well developed two-year-old fillies should be bred, but they should be well fed, as two bodies must be nourished. If your filly receives plenty of nutrition there is very little danger of her being stunted, and she will prove a better producer by being bred at this age. She ought to be broke to work during her second year, but she should do only enough work to get accustomed to such labor, so that in later years she will be broken to work, without the danger of causing an abortion.

If an extra growth is wanted the two-year-old mare will require grain in addition to good pasture.

OBSCURE LAMENESS—I have a 7-year-old driving mare that has been lame in her front quarters for almost eighteen months. It began originally with an almost imperceptible limp in her left front foot which in the course of a couple of weeks became quite pronounced. Try as I would I could not find a sore or tender spot upon her, nor could a veterinary surgeon to whom I took her, do any better, but he told me to blister her entire shoulder repeatedly. I did this, but she continued to grow more stiff and lame all the time, until in six months she was lame in both front legs. I then thought perhaps the board floor in the barn was not good for her and so moved her into a warm shed without a floor, and she seemed to improve a little, but never became able to work at all last summer. She raised a very good colt, however, and is in foal now. That brings me to the question. Is there such a thing as colt founder? Several old men in the neighborhood have suggested colt founder as the cause of her lameness, saying I should not breed her. Is this a fact? Others have suggested water founder for which they say there is no cure.

Last September I took the mare to a doctor near here, who said she had bruised or strained the navicular or coffin points, and recommended having her feet packed and shod, and he gave it as his opinion that she would be all right in a short time. The first shoeing failed to do her any perceptible good, so in five weeks had her re-shod with plain shoes, but could not see any improvement. The smith that shod her gave it as his opinion that she was not lame below the ankle, as he had made a study of that part of a horse. He also said he had never seen a healthier looking foot on any horse. She hadn't been driven much before she went lame. She is bad about kicking other horses in the pasture, so thought perhaps she injured herself in that way. If you will please publish as much of this as you think necessary and a reply, you will greatly oblige.—Illinois Subscriber.

REPLY—We are placed at quite a disadvantage in this case, inasmuch as the symptoms you describe do not point to any definite place as being the seat of lameness. You will readily appreciate that if numerous persons have examined this mare, including your shoer and veterinarians, and can reach no common ground for agreement, it would be folly for us to venture an opinion. One thing is certain, and that is that it should not be difficult for a qualified veterinarian to reach a definite conclusion in this matter if he will properly apply a solution of cocaine along the trunk of the sensitive nerves of the limb.

By a process of exclusion the entire lower part of the limb can be eliminated by this method and found free from affection, the lameness must be confined to a restricted area in the upper part of the limb. Three diseases need to be closely studied in this case, viz., rheumatism, navicular diseases and chronic laminitis. Lose no time, but take her to a veterinarian prepared to apply modern methods in making a diagnosis.

BRITTLE HOOFS—I have a mare that had side bones developing when purchased, but they seem to have stopped growing, as lameness has subsided. However, the frog of that foot has shrunk in until she has practically no frog left, and the sole is very concave. The other foot is the same, only not so severe. Both hoofs are brittle and do not grow well, although there is no breaking down of the tissues.

REPLY—The mare's feet should be carefully treated so as to bring the frog as close to the ground as practicable, and she should be put to work that she can do without being shod. The ideal place is farm work, where she can be kept on the soft ground. Directions are given under another inquiry for the treatment of brittle hoofs and we would advise that you follow the directions given there.

STALLION SUMMER SORE—I have an imported stallion, which, when we took him out of the ship, had hurt his hind leg and right ankle, and I cannot get it to heal up.—Ohio Subscriber.

REPLY—These sores are difficult to heal. The O. P. Wilson Serum and Instrument Company is advertising "Jack Sorine," which is guaranteed to cure all sores on the legs of stallions or jacks. This firm has deposited a check for $500 with the American Breeder, to fulfill this guarantee, that if it does not make satisfactory cure without any restriction, the box may be returned and your money refunded. If you think it worth $5 to have this stallion cured, you might give this remedy a trial. You will find their advertisement in this paper. Whatever medicine is used in a case of this kind, it would be better to feed the stallion a teaspoonful of glaubers salts twice a day. If this does not loosen the bowels sufficiently, increase the dose slightly for a week or ten days. Before applying "Jack

Sorine" poultice the sore with hot bran poultice, adding hot water every half hour as hot as the hand can be held into, for 8 to 10 hours; then wash with castile soap and rinse off with clear water, after which dry it with a very soft, clean cloth. Do not wash it any more, but administer the paste with a small paint brush sparingly three times a day until cured. This new remedy has given excellent results.

NAVEL ILL—Have had some trouble with colts. One of them about three weeks old became lame in the right hind leg, remained awfully swollen for about 24 hours, then the front leg swelled up, then there was a streak swelled up all along its side and it died. The colt was doing nicely until this happened. Could this be caused from being around the barn yard; or could it be some kind of pleurisy? Would you advise leaving mares to foal in the barn where they are bedded in straw?—Wyoming Subscriber.

REPLY—We suspect that your colt is affected with the so-called navel ill and that the disease localized within the body which caused the rather sudden death. During inclement weather it is advisable to arrange for mares to foal in inclosure and one should give careful attention to the conditions of the stall. That should be kept scrupulously clean during this period and deep bedded with clean, bright straw.

FAILS TO COME IN HEAT—I have a Holstein heifer which is two years old this month. She is large and well developed for her age, but has never come in heat. What treatment would you prescribe?—Ohio Subscriber.

REPLY—Have a qualified veterinarian make a vaginal-rectal examination with a view of determining the nature and development of the genital organs, and if everything is all right have him carefully massage both the uterus and ovaries. This practice often induces estrum when properly done.

RUNNING SORE—What can be done for a mare that has a running sore near the lower end of the prominent side bones of the face? About three years ago it was noticed to be skinned and inflammed at this point, and it developed into the present condition. The sore is on the left side, and discharges more at some times than at others. Is slightly puffed about the opening. Please advise complete treatment.—Missouri Subscriber.

REPLY—Have a good veterinarian examine the case with a view of scraping the bone or removing a diseased tooth, which may be the cause of the trouble.

KNUCKLING—Will you kindly tell me what to do for a young Percheron mare that knuckles both in front and behind? She is coming two years old in May. This commenced when she was about six months old. The first year she was fed all the oats she would eat, three times a day and all the hay she would eat. Her weight at twelve months of age was 1,200 pounds. Last summer she came back on her pasterns quite a little, and I thought she would be all right, but this winter she is standing quite straight again. She is very much worse in front than behind. I blistered her in front about a month ago, but cannot see any change yet. Would it do to have her shod in front with no toe, and raise the heels with corks? I think that running on pasture this summer will help her very much, but if there is anything I can do to help her overcome this, and any information you can give me, I will be very thankful.—Ohio Subscriber.

REPLY—Carefully examine the back tendons and see if they are thickened at any point, and if so allow the blister to take in the entire back of the limb up to the knees and hocks as well as the fetlocks and parts below. By all means discontinue the animal from service and give a season's run at grass. Repeat the blistering every 30 days.

DIFFICULTY IN SERVING—I have a Shire stallion 5 years old. When he tries to serve a mare he breaks down and falls off backwards without serving. To see this horse travel you would not know anything was wrong with the horse. He is able to rear and get on a mare apparently as easy as any horse, but when he is about to enter the mare he breaks down and falls off. Last year this horse served eighty mares. This spring he has served five mares before he ever broke down. About a month ago he slipped on the wet ground and fell twice while I was exercising him, both falls being very hard ones, but at the time did not seem to hurt him. He served the five mares after falling. I am unable to tell if this trouble is in his back or hind legs, but am inclined to think his trouble is in his back. If it was in his legs it seems to me that it would show up in his training. Please advise.—Kansas Subscriber.

REPLY—You are perhaps correct in thinking that your horse is injured in the region of the back, perhaps near or at the coupling. Bathe this region with a good stimulating liniment two or three times a day. For this purpose use soap liniment and alcohol equal parts. Should it cause soreness of the skin in a few days dilute the liniment with water. It would be best to discontinue this animal from service for the season and give him a run in a grass paddock by himself.

LAME JACK—Will you please tell me what is the trouble with my jack's feet, and a cure? He cripples along almost as bad as he would if he had a nail in his foot, and it don't seem to be sore, when you hit on the bottom of his feet, but in trimming them out there is red spots in the foot. It may be corns. He is about 15 years old, and a good breeder. He is slow, too, which is uncommon for him. He has never been crowded. I feed him ground kafir corn in head, a little bran and a little oats and a handful of cottonseed meal about twice a day, with alfalfa and prairie hay.—Kansas Subscriber.

REPLY—Have his feet carefully trimmed and then apply good, big warm poultices to the feet, changing twice a day. Permit the poultice to envelop the entire foot and keep it warm by immersing the foot in a pail of water as hot as he can stand it several time a day. Do this for several days and if he does not improve write us again.

BUCKEYE POISONING—Is there danger of buckeye poisoning at this time of the year in cattle turned out to range where there is a fair quantity of grass? Part of our pasture is in timber and buckeye grows on the low ground. People have cautioned me against the danger of poisoning, but I thought if there was plenty of grass the cattle would leave the buckeye alone. Please give me the symptoms of buckeye poisoning, and what is the best treatment.—Missouri Subscriber.

REPLY—Cattle are not much inclined to partake of buckeye shoots and blossoms provided there is a good growth of grass obtainable. The difficulty is that most seasons the buckeye is in advance of the grass, and being one of the first green things to appear in the spring invites poisoning when eaten. The safe practice is to eliminate the danger by removing all the young buckeye trees with the ax. When an animal is poisoned from eating buckeye shoots they soon lose control of their limbs and get down. Treatment consists of keeping them in a warm, sheltered place and covered with blankets if necessary. The animal should be turned out several times day so as to be made comfortable. A purge of Epsom salts may be given (one and one-half pounds) if the animal's condition will admit, and follow with stimulants, such as alcohol and nux vomica. For this purpose give one ounce of alcohol and 20 drops of fluid extract of nux vomica in one-half pint of water every three hours.

FRACTURE—I have a mule colt that got her leg broke about the stifle on December 22. The leg is well and straight enough, but the big leader from her hock up to her hip seems to be too short. She can stand on this leg, but when she walks she does not let it touch the ground. Please give me a remedy to soften this leader and cause it to lengthen out, so she can put that foot down when she is walking. She will be a year old about the last of this month. I have just had her a few days.—Arkansas Subscriber.

REPLY—Fractures in this region are difficult to handle successfully for the reason that the broken ends of the bones can not be properly held in position by bandages. It is very likely that the bones have united out of position, that they have slipped past each other and in this way the leg has been shortened. There is not much to be done for a case of this kind excepting to give it time with the hope that the colt may grow out of it. This it may be provided the joints were not involved in the fracture.

BLACKLEG—Please tell me when is the best time to vaccinate for black leg in cattle. How old an animal should one vaccinate as a precaution or are cattle of all ages subject? If there is a difference in breeds in susceptibility of this disease, I should like to know it. I have been told that the Galloways, due to their heavy coats of hair and thick hide, were less subject to blackleg than other breeds.—Iowa Subscriber.

REPLY—No breed of cattle is exempt from blackleg. Young stock seem to be far more susceptible than matured animals and the disease confines itself largely to young things up to two years of age, beyond which point cattle seem to have an immunity. We would advise that all stock up to that age be vaccinated once or perhaps better twice yearly. The disease usually manifests itself in the summer months so that the safer practice is to vaccinate spring and fall.

FOUL SHEATH—I have a stallion that has been very foul in his sheath and I have not dared to clean his sheath, fearing that he would take cold. He has scabs on his penis and his sheath is large and rather hard. It seems to be swollen.—Indiana Subscriber.

REPLY—The few minutes required in cleaning the sheath of your stallion as well as the small amount of surface wet, need give you no great anxiety about your stallion catching cold. Simply prepare a warm bran mash and proceed to get busy.

ABORTION DUE TO INFLUENZA—A great number of horses in this community have influenza and most of the mares that were affected have aborted. Will this have any effect on them getting in foal this season, and if so, what can be done with them?—South Dakota Subscriber.

REPLY—While influenza is a disease that does not often prove fatal when treated by a competent veterinarian, yet it does a vast amount of mischief in the way of favoring va-

IMPORTED STALLIONS

PERCHERON, BELGIAN, OR GERMAN COACH

A large selection of the above named breed of excellent quality, at reasonable prices. Every horse leaving our barn is backed by a fair and square guarantee. Our twenty-seven years of continuous importing high-class stallions with a resident buyer in Europe enables us to meet all competition. If in the market for a stallion, write us. We can use bankable paper.

OLTMANNS BROS.

Box 87 - - - Watseka, Ill.

Leer, Germany; Nevada, Missouri; North Fort Worth, Texas

BREEDING ESTABLISHMENT FOR SALE.

One bay Percheron, registered in the Percheron Society of America; coming 5 years old this spring.

One black Percheron, coming 3 years old this spring, registered in the Percheron Society of America.

Four of the best jacks in the state, and one brown French Coach, 10 years old this spring, grade.

Will sell barns and everything. Best of improvements; in fact, best in state. Will let books go in sale. This year can get 500 mares. Plenty of fine water. Wll take part cash and balance in good notes.

A. G. BUSH, Fairland, Ottawa County, Oklahoma.

STALLION SERVICE RECORD BOOK

Every Stallion or Jack owner Should have this record book, because it is accurate. It is a handy pocket size, with a Waterproof cover, printed on best of paper.

It has a calendar, also a gestation table. It has an index of ten pages, so that each mare can be found easily It has room to give a complete record of each mare. 100 mares can be recorded, each mare having a whole page. The blank at the bottom of each mare's page, when properly filled out and signed gives you a promissory note that is legal and binding.

If you ever use one of these records you will want more of them, just as thousands of others are doing. It has no worthless advertisements in it. It is the latest Stallion Record Book on the market. If you are not satisfied with it, return it, and get your money, which will be cheerfully and promptly refunded to you.

KANSAS CITY, MISSOURI.

rious other disorders, one of which is abortion, the difficulty complained of. No mare that has aborted from any cause should be bred for several weeks after the trouble, for the reason that she is quite apt to abort again within the same period. If the mare has been depleted by influenza the time of breeding should be extended. In fact she should not be bred under any circumstances, after aborting, until she again appears to be in first class physical condition, and especially should there be no unnatural discharge noticeable upon a critical examination of the genitals.

UNGUINAL HERNIA—I have a filly coming two years old in May, that has a rupture at the navel as large as a good sized walnut. I have had this operated on twice, but it did not do any good. Would you advise me to have it operated on again? Would you advise breeding this mare at two years old?—Iowa Subscriber.

REPLY—If your mare has been operated on twice with failure each time we think things do not look very encouraging for a repair of the part. The mare has now reached an age when the fetal structures that aid in closing the opening have been largely absorbed. In the event the opening is not sufficiently large to favor the bowels descending through the opening and thus inviting strangulation of the bowel, we would advise against further operation, unless it could be done by one who makes difficult surgery a specialty.

SWOLLEN LEG—I traded for a fine trotting bred colt today, which cut its hind leg in a wire fence last fall. The cuts were not deep, but there were several of them. The cuts have healed but the leg from the pastern half way up to the hock is nearly twice as large as it should be. Please tell me how to remove this.—Ohio Subscriber.

REPLY—It will require time to reduce the enlargement, but it may be hastened by means of daily massage of the parts. In addition to kneading and working the swollen limb apply alcohol and witch hazel equal parts, which may be rubbed in. One thing is very important and that is that the colt be given the privilege of running in the pasture whenever weather conditions will permit, for constant exercise will greatly facilitate absorption. The greatest thing you have to fear is that the parts will organize and thus cause a permanent enlargement.

BLEEDING AT THE PENIS.

With the spring opening of the breeding season we receive numerous complaints from stallion and jack owners about the animals bleeding during service. The following inquiry will serve to illustrate this class of complaints:

I have an imported Percheron mare, 7 years old, that throws off urine. She commenced doing this two years ago, while she was in foal. It seems to be the clear urine. She will throw her tail up as she walks along, and the urine seems to squirt out, and she never stops or pays any more attention to it. Have had her examined by a veterinary and he says he cannot find anything wrong. I have not been able to get her in foal since unless she is in foal now. I bred her in October, and she has the appearance of being in foal now. She seems to always feel good, and keeps in good shape.—Nebraska Subscriber.

There are numerous conditions that are instrumental in causing bleeding during service. First, it must be remembered that the penis of the horse is in a state of intense congestion during the act and if there is any weakness in the wall of the urethra at any point it makes things favorable for hemorrhage to occur. We believe that the chief cause of diseased conditions of the urethra to be due to some previous infection. It may be that the same organisms that are concerned in producing diseased state of the mucous membranes of the vagina and uterus of the female are also responsible for a similar condition along the course of the urethal canal of the male, and further that there develops on the surface of the same mucous membranes localized ulcerative patches which are inclined to bleed during copulation. Further, there may be diseased spots higher up the organ that are responsible for the hemorrhage. We have always had a notion that the harmful effects of the breeding bag did not stop by making a good server a quitter, but that it had its influence in developing this class of complaints.

THE QUESTION OF SORE NECKS.

To The American Breeder: Would like to hear through the columns of your valuable paper, ranchmen's opinion, how to avoid sore necks on the sulky rake. In this section of the country where the hay meadows are under irrigation the team on the sulky rake gets bad sores on top of the neck, caused by the wheels passing through the laterals one at a time, causing the point of the tongue to jerk. We use snug fitting collars with galvanized steel tops, so there is no fault to find with the collars. The side delivery rake does not give as good satisfaction as the sulky, but I think it is easier on the necks. Jas. Davison, Sheridan County, Wyoming.

Imported Horses $1,000 Each

Home-bred registered Draft Stallions. $300 to $600. All horses warranted sound and sure breeders.

Reference—Any bank in Osceola.

HART BROS.,
Osceola, - Iowa.

Look! Look!

We have a number of good big first class young Percherons and big black jacks that we will sell at a very low price, and guarantee same, if taken at once. Fisher & Walker, Evansville, Vanderburg County, Indiana.

PERCHERON STALLIONS.

One BLACK Herd Stallion, seven years old, weighing 1,850 lbs.; 4 yearlings. All big boned and sound. Also a few mares. Stetson Bros., Neponset, Bureau Co., Ill.

PERCHERONS FOR SALE

We are offering an extra choice lot of stallions from 2 to 6 years old. They are the large drafty fellows that the farmers like and the kind the market demands. All stallions recorded, and sold under a written guarantee. Will price them where they will sell and on terms to suit. Singmaster & Walker, Union Stock Yards, South Omaha, Douglas County, Nebraska.

County Breeders' Organization

One of the Many Letters Favoring the Plan. Points to Consider in Starting Such Associations. Good Work and Influence of Those Already Established.

To the American Breeder:—I have been a silent reader of the Stallion and Jack (now the American Breeder). Many valuable points have I learned from that paper. Therefore I wish the Ameircan Breeder a bountiful success, for its everlasting effort. I noticed an article in the issue of February 5, 1912, where you recommend a county breeding association. That "struck me as just about middle ways," as I have advocated the same idea to my contemporaries heretofore. Now I come to you for further advice and help, to arrange such a county organization, in suggesting a plan and publishing it in a March issue, or as soon as possible, so that many others may get the benefit of the plan.

Nine years ago this spring I bought an imported stallion. That was the first imported horse in this community or county. So far as I know it was the first registered horse. Since that time there has been a big change in our horse stock. That brought different breeds of registered horses to this vicinity. The people in general are now realizing that the registered animals are the only stuff to breed to.—Louis Knoop, Benton county, Mo.

One or two references that have been made in these columns to the need of county breeding organizations have brought us many letters of commendation and many more of inquiry. As a sample of the latter we print above the letter of Mr. Knoop, selected because this gentleman, although a reader of the American Breeder since its beginning under the name of the Stallion and Jack News, has never before occupied space in our columns. Mr. Knoop shows that he is a doer in asking at once for a plan upon which he and his associates may proceed.

Any particular plan for organizing a county breeders' association must, of course, be influenced by the character and needs of the locality. In a general way, however, the plan should first of all be a broad one. The efforts of the organizers should be to interest everybody, and to show everybody, merchants and bankers as well as farmers of every class, that the improvement of the community's live stock is to the interest of all.

This improvement in the domestic animals on the farms should, of course, be the main object of the organization and every proposed activity of the organization should be considered as a means thereto. In some counties where the live stock interests are small, a small beginning must necessarily be made, and it is sometimes desirable to secure encouragement from some outside community in which the movement has made better progress. Exhibitions or live stock shows, if they are attempted, will necessarily begin on a small scale. The first and the best efforts of the organizers will be to get a good turnout of interested parties. Colt shows and poultry shows often prove the best means of making a beginning, and it will surprise one who has not considered, or investigated, the matter to find out how many people, men, women and children, and how nearly every class and business in the county can be interested in thees two kinds of exhibits. Such shows and the usual meeting for discussion and the reading of papers, will soon pave the way to real county institutes.

In almost every state the heartiest co-operation can be had from the extension departments of the agricultural colleges. In fact in many cases the men employed in these extension departments have been leaders in working up local interest in such meetings. As a county organization grows, a thing to be avoided is a tendency to spread out instead of to go deeper. There are few counties that can afford to undertake building up the scale of a state institution. There should be no such spreading out until every need of the live stock interests within the county has been met.

It is probable that the first move will have to be made by men directly interested in the breeding of improved live stock, but it will be a rare case indeed if they cannot secure the immediate co-operation of the banker, the lumberman, the implement dealer or the superintendent and teachers of public schools, or many or all of these, and the fact that they are engaged in a work which interests every class should never be forgot. While keeping constantly in mind the point that the organization is working for the people at home, and everyone, no matter how inferior his live stock, should be encouraged to take part, a proper standard of excellence in judging live stock should always be maintained. In fact the very first things which should be established in an educational way, are correct ideas as to animal excellence and the succeeding efforts should be to educate all up to the point of knowing what constitutes a good animal of every class which the community uses. That once done, all further educational work and promotion can have a definite aim.

It goes without saying that there should be no jealousies between breeds or people, although a friendly rivalry is always to be desired. The man who stands a good Percheron stallion is working along exactly the same lines as the man who stands a good Belgian, Shire or Clydesdale, and there is no reason why any but the friendliest feelings should exist between the men who are breeding good Shorthorn cattle and the ones who are breeding Herefords. Each should encourage those whose stock needs improving, to patronize whichever one of the breeds or classes seems best to meet his needs or fancy.

The territory covered by the American Breeder is dotted with communities in which the farms have been made more valuable and the live stock wealth greatly increased by these associations, and as a rule the communities which are lacking in live stock wealth, and in which farms are deteriorating and interest in farming is standing still, will get the best help they can have through starting organizations of this kind. The principal thing that horsemen are interested in is the education of mare owners. This coming together of farmers and breeders offers a wonderful opportunity for accomplishing this.

INDIANA HORSE MEN ORGANIZE.

At a meeting in Indianapolis, Ind., which was attended by horse breeders, farmers, and importers from nearly all sections of the state, the Indiana Draft Horse Breeders' Association was formed March 20th, 1912. This meeting followed a call issued by a committee on state organization appointed by the Hamilton County Purebred Draft Horse Breeders' Association at a recent meeting held at Noblesville, Ind., this county organization thus leading in an important work.

The election of officers resulted as follows: President, T. E. Beals, Noblesville; vice-president, J. T. Donnelly, Anderson; secretary-treasurer, D. G. Thompson, Lafayette.

As a rule corn fed pigs give more leaf lard than others.

AMONG THE BREEDERS

PUBLIC SALE DATES.

Upon request we will announce, under this head, free of charge, the date and location and the name of proprietor or manager, for all public sales of pure-bred live stock which are to be advertised in the columns of The American Breeder.

Percheron Horses.

May 29—J. C. Robison and Dr. J. T. Axtell, at Towanda, Kas.

Shorthorn Cattle.

May 28—Ira Cottingham, at Eden, Ill.

June 5—Howell Rees and Bellows Bros., at South Omaha.
June 6—C. S. Nevius, Chiles, Kas.
June 7—Jos. Miller & Son, Granger, Mo.
June 18-20—Sidney B. Smith, Mgr., Springfield, Ill.

Hereford Cattle.

May 1—J. H. White, Granger, Mo.

Angus Cattle.

June 5—Chas. Escher & Son, Botna, Ia.
June 11—P. J. Donohoe and John Cash, Holbrook, Ia.
June 12—Patrick Leahy, Williamsburg, Ia.

Poland Chinas.

May 14—C. S. Nevius and Geo. Wedd & Son, at Spring Hill, Kas.
May 15—W. B. Wallace, Bunceton, Mo.

Robison-Axtell Percherons.

A big Percheron sale will be held at J. C. Robison's big Percheron ranch near Towanda, Kas., on May 29. There will be 40 head of registered Percherons; 20 from the well known Robison ranch, where the great show stallion, Casino, has been at the head of the herd for many years. His blood runs through most of these horses and this herd needs little introduction to readers of The American Breeder, as it is one of the oldest and largest herds of registered Percherons in the West.

Twenty head is from the herd of Dr. J. T. Axtell of Newton, Kas. Several years ago Dr. Axtell purchased a number of high class Percherons, paying a long price for most of them, as his foundation stock. He has been very successful in the Percheron business, is a good developer, as the stock will show plenty of size and substance. Dr. Axtell is now dispersing this herd of Percherons and all will be sold to the highest bidder. Here is an opportunity to buy some good stock that would not otherwise be placed on the market.

All the mares in this sale that are old enough are bred, many of them having colts and are bred again. A number of nicely matched pairs will be sold. Here is an opportunity to buy good mares at a reasonable price. There are also ten yearling and two-year-old stallions included.

Send to J. C. Robison, Towanda, Kas., for catalog, and mention The American Breeder.

W. F. Young, R. F. D., 388 Temple St., Springfield, Mass., writes: Absorbine is scientifically compounded of the best ingredients I can buy—it is purely vegetable containing no poisons or minerals. Careful laboratory tests conclusively prove its antiseptic and germicidal properties. Notwithstanding its powerful results, Absorbine is a mild and pleasant liniment to use, does not blister, stain or remove the hair, and horse can be used during treatment. It is economical as only a few drops are required at an application. A bottle of Absorbine diluted as per formula on label, makes three gallons of efficient liniment at a cost of 80 cents a gallon. Write for detailed laboratory reports on the germicidal value of Absorbine, or Absorbine, Jr., Absorbine at druggists, $2.00 a bottle or sent direct, express prepaid, upon receipt of price.

Attention is called to the advertisement of J. W. & F. T. Peterson of Litchfield, Minn., which appears in this issue. They are well known importers and breeders of Percherons, Belgians and Shires. They received their last importation on May 2. All animals are sold at their barns as they have no agents to treble the price. Write them if you are interested.

Taylor & Jones, Williamsville, Ill., write: "Our sales continue good and among those who have recently been here and bought are the following: James Wallace, Oakland, Ill., who bought his first horse of us three years ago, came and bought another stallion, a Shire, that we are sure will please his people. French Brothers, Allendale, Ill., came and selected a good, imported Percheron stallion for their use. Wilkinson & Son, Edinburg, Ill., who breed on quite an extensive scale, and are buying better stallions each time, who have been buying horses of us for many years, came and got one of our very best imported Percherons for use on their mares. McManus Brothers, Taylor Ridge, Ill., who have also been buying of us, came here after they hay spent quite a lot of time inspecting horses, and selected an extra good imported Percheron. J. C. Wiley, Sullivan, Ill., who knows a good horse, made no mistake when he selected what we consider one of our very best 3-year-olds. This horse will do Mr. Wiley's community a lot of good. S. H. Smith, Nebo, Ill., gets an imported stallion with quality that will make good for Mr. Smith and his people.

Trumans' Pioneer Stud Farm writes: We are very pleased to say that our second importation for 1912 that arrived here on the 10th ult., are doing first class, which, in addition to our February importation, gives us a very choice collection of strictly high class Shire, Percheron and Hackney stallions for sale. Last week we had the pleasure of selling to Henry J. Stoecker of Floyd County, Iowa, an imported roan Belgian stallion, which will be a great addition to the draft horse interest of his county. To Charles Bass of Mahaska County, Iowa, an imported Percheron stallion. J. J. Serven of Prairie City, Illinois, a Shire stallion. Mr. Serven has perhaps bred more registered Shire horses than any other man in this country, and has purchased all his stallions from us for the past twenty-eight years. S. H. Brown, Jr., of Shelby County, Missouri, purchased an imported Percheron stallion. A company of bankers and breeders at LaBelle, Missouri, purchased an extraordinary good Shire stallion. Our old customer, C. H. Spurgeon, of Clark County, Missouri, two imported Percheron stallions. Fred Holtby, Story County, Iowa, purchased the noted Shire stallion, Bury Top Quality, one of the best bred Shire stallions in the country today. This gentleman is one of our old customers. Jesse R. Manock, Peoria County, Illinois, purchased an imported gray Percheron stallion. W. R. Baumgardner of McDonough County, Illinois, purchased the dark gray imported 3-yar-old Percheron stallion, Ja (85708), sired by the champion Etudiant, and is one of the low-wide-as-a-wagon kind. His brother also purchased a Percheron mare at the same time. Our old customer, John Fetzer, of Iowa City, Iowa, has purchased an extraordinary 4-year-old imported Shire stallion. He has always purchased the best Shire stallions he could find and this horse is no exception. It is certainly a pleasure to have your old customers coming back right along.

Two splendid bargains in jacks is advertised in this issue by Oakland Stock Farm, Box 207, Chillicothe, Mo. It would pay anyone who is in the market for young jacks to investigate this offer.

Lawrence-Williams Co., Cleveland, Ohio, start an advertisement in this is-

---

Twenty big black jacks, with white points, for sale. Ten, from three to seven years old; five, coming two years old. They have lots of size, bone, quality and style. Write for catalogue. We also have 200 mare mule colts, for sale in car load lots.

SCOTT, ABNEY & JENKINS
Virden, Macoupin Co., Ills.

CLOVERDALE FARM

Breeders of jacks and Percheron horses. 20 three and four-year-old jacks; 15 yearlings.

Some nice Percheron stallions, mares and colts; also Tamworth Swine. All stock registered or subject to register.

Would be glad to have you visit our farm or write for circulars. H. T. Brown & Co., Lexington, Fayette County, Kentucky.

Here are Two Jack Bargains

"In large breeding herds, now and then a jack with as good blood as flows in the veins of the king of the tribe, will be off size. Out of 50 jacks I have but two young ones that are 13½ hands high; one coming three and one coming two. I will sell either of these jacks for $200. They are both good colors, nicely marked, one 13½, the other 13 1-3. They will both be over 14 hands high. A chance for a man of moderate means to get him a small, good blooded jack." Address, Oakland Stock Farm, Box 207, Chillicothe, Mo.

LEAVENWORTH COUNTY JACK FARM.

Forty jacks and jennets, 3 to 8 years old; one good herd jack; also one registered Percheron stallion for sale. Write for prices. Buyers may reach farm from Easton on Leavenworth, Kansas & Western, or Potter on the Santa Fe. Corson Bros., Potter, Atchison County, Kansas.

Republic County Jack Farm—17 jacks and jennets. Three 2-year-old jacks sired by Missouri King—that's hard to beat. Come and see some good stuff. Remember that I pay car fare if I disappoint you. T. E. Collins, Belleville, Kas.

Jacks For Sale

26 fine large Tennessee jacks; 6 months to 7 years old. Also 24 jennets bred to fine jacks. Prices right. Catalog free if you mention American Breeder. S. W. Jetton & Co., Murfreesboro, Tenn.

JACKS AND MULES

300 head of Colorado raised Jacks, Jennets, Mules and Brood Mares. All guaranteed. Prices right. Lewis Swink & Son, Rocky Ford, Otero County, Colorado.

Fairview Jack and Jennet Farm

A fine assortment of the best Mammoth jacks and jennets that grow. 14½ to 16½ hands high; jacks with lots of bone and substance. Everything guaranteed as represented. Prices right. Address

J. C. Huckstep, Eolia, Pike Co., Mo.

Corson Bros., Potter, Kas., would be glad to quote you prices on their jacks and jennets; they also have a registered Percheron stallion for sale. Do not fail to read their advertisement in this issue and write them for prices.

sue. They are advertising Gombault's Caustic Balsam, which is warranted to give satisfaction, and would be pleased to send all readers of this paper a descriptive circular, telling all about this balsam. Do not fail to write them.

If you are bothered with worms in horses, be sure to read the advertisement of W. R. Gilbert, Calgary, Alberta, Canada. He has a sure cure for worms and says if you are not satisfied he will return your money. His advertisement appears in this issue.

Remember the E. M. Gates Aberdeen Angus sale at La Plata, Mo., Thursday, May 16. He is selling a high class lot of Angus cattle. Nearly the entire offering is by the great herd bull, Lord Roberts 3d, or bred to him. If you have not a catalog, write for one at once and arrange to attend the sale.

May 14 is the date of Geo. Wedd & Son and C. S. Nevius' sale of Poland Chinas at Spring Hill, Kas. They are offering 50 head of bred sows and gilts and this will be a good place to get what you want in the way of young stuff. Write for a catalog and attend the sale.

W. B. Wallace will hold a sale of Mammoth Poland Chinas at Bunceton, Mo., Wednesday, May 15. He is offering a choice lot of young boars and gilts and if you are in need of a good Poland China of either sex you cannot well afford to miss this sale.

C. E. & F. W. Madsen, McDonald, Kansas, have seven head of registered Galloway cattle they would like to sell or trade for Percheron horse, jack or mare. If you are interested in anything of this sort, do not fail to read their advertisement and write them for full particulars.

If you are in the market for Shorthorn bulls, Gus Benson, of Bucklin, Mo., would be pleased to tell you about the ones he has for sale. See his ad in this issue and write him.

A car load of Clydesdale stallions are advertised in this issue, by R. O. Miller, Lucas, Iowa. Mr. Miller will dispose of them at as low a price as possible to make room for another load.

H. B. Alderson, Devil's Lake, North Dakota, wants Percheron mares, stallions or jacks in trade for industrial stock, land or automobile.

Read the advertisement of Hart Bros., Osceola, Iowa, about their imported horses. All horses warranted sound and sure.

Some extra good young Percheron stallions, and mares in foal, with plenty of bone and quality, are for sale by A. M. Walker, Laclede, Missouri.

D. K. Roth, of Gibson City, Illinois, writes that he has just returned from France with a new importation of Percherons and Belgians.

Registered Morgan stallions coming two, three and four years old, of large size and fine breeding are advertised for sale by Richard Sellman, of Rochelle, Texas.

Philip Walker, Moline, Kas., writes that he has sold over 40 head of jacks and jennets this season.

A. D. Benton, one of our good subscribers at Botnam, Ia., who has an advertisement of his Percheron stallion for sale in this issue, writes of selling a span of grade Percheron mares recently for $600.

Eight Young Jacks

and 12 jennets for sale or trade. These jacks are of my own raising, and can sell them cheaper than dealers. H. A. Schwatken, Hammond, Bourbon County, Kansas.

FAIRVIEW STOCK FARM

25 Mammoth jacks from weanlings to 8 years; largest breeding herd in the West. Herd headed by the great Pharoah 2491, Champion of Tennessee in 1910.

H. T. Hineman, Dighton, Lane Co., Kansas

Jack Sores Cured

By Using Jack Sorine. Sold With a Cash Guarantee.

We guarantee Jack Sorine to cure any sore on the legs of a jack or stallion, no matter how long it has been sore or what caused it. You know we have a good, reliable remedy or we could not guarantee it to cure all sores on the legs of stallions and jacks, without any restrictions. It is put up in tin boxes, six inches long, three inches deep and three inches wide, and sent promptly my mail. It is a paste and applied with a small brush three times a day.

Send money by bank draft or P. O. money order. Price, $5.00.

O. P. WILSON SERUM AND INSTRUMENT CO.,
3754 Wayne Avenue, Kansas City, Mo.

Samuel Drybread of Elk City, Kas., writes: I have on hand 150 head of registered Herefords headed by Tophon 4th, 289662, an intensely bred Anxiety blood. I now have in herd something like 200 head, representing most all the up-to-date blood lines known to the breed. I have been breeding Herefords and Durocs the past 12 years.

If you are interested in jacks and Percheron horses, do not fail to read the advertisement of H. T. Brown & Co., Lexington, Ky., in this issue. They would be glad to have you visit them at any time and look over their stock.

Write J. T. Watson, New London, Mo., for prices on his Mammoth jacks and jennets. He has a fine bunch of animals and will make the price right.

Jas. P. Milliken, Media, Ill., is advertising a number of pure bred Galloway cattle in this issue. He has bulls from yearlings up to five years old; cows from three to ten years, and heifers, yearlings and two-year-olds. Write him for prices.

John R. Tomson, Dover, Kas., will be pleased to hear from any one interested in Scotch or Scotch-topped Shorthorn cattle. Read his advertisement in this issue, and write him.

A herd of registered Hereford cattle is advertised in this issue by C. Bordwell, Batavia, Ohio. The herd consists of 15 females, one standard Polled bull and five steers. He is making a very low price on this herd. Write him for particulars.

If you are in the market for a first class stallion or filly, write J. L. Buchanan, Sherodsville, Ohio. He is offering some splendid Percherons and Morgans at very reasonable prices. See his advertisement in this issue.

If you want to buy some good jacks and jennets, T. E. Collins of Belleville, Kas., says he would be glad to quote you prices. He has a nice herd and will treat you right. See his advertisement and write him.

S. W. Jetton & Co., Murfreesboro, Tenn., are advertising their Tennessee jacks and jennets in this issue, and would like to send a catalog to readers of this paper who are interested. Write them for prices; you will not be disappointed.

A fine black Percheron stallion is advertised for sale or exchange in this issue by A. D. Benton of Botna, Iowa. Read the advertisement and write for particulars.

GRAIN STOCKS LOWEST IN THREE YEARS.

(Continued from page 25.)

and 32.7 per cent of the 1909 crop so shipped.

The quantity of barley on farms March 1, 1912, was about 24,760,000 bushels, or 15.5 per cent of the 1911 crop, against 33,498,000 bushels, or 19.3 per cent of the 1910 crop on farms March 1, 1911, and 42,602,000 bushels, or 24.6 per cent of the 1909 crop on farms March 1, 1910. About 57.2 per cent will be shipped out of the counties where grown, against 50.0 per cent of the 1910 crop and 52.5 per cent of the 1909 crop so shipped.

A Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

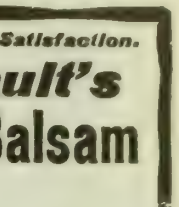
As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

The Lawrence-Williams Co., Cleveland, O.

Don't Have a Blind One "VISIO"

An Absolute Cure for Moon Blindness (Opthalmia), Cataract and Conjunctivitis

Shying horses all suffer from diseased eyes.



"Visio" will convince any horse owner that it will absolutely cure defects of the eye, irrespective of the length of time the animal has been afflicted. No matter how many doctors have tried and failed, use "VISIO" under our GUARANTEE to refund money if it does not cure.

$2.00 per bottle, postpaid on receipt of price.

VISIO Remedy Ass'n, 2475 Calumet Ave., Chicago, Ill.

Don't Cut Out A SHOE BOIL, CAPPED HOCK or BURSITIS FOR

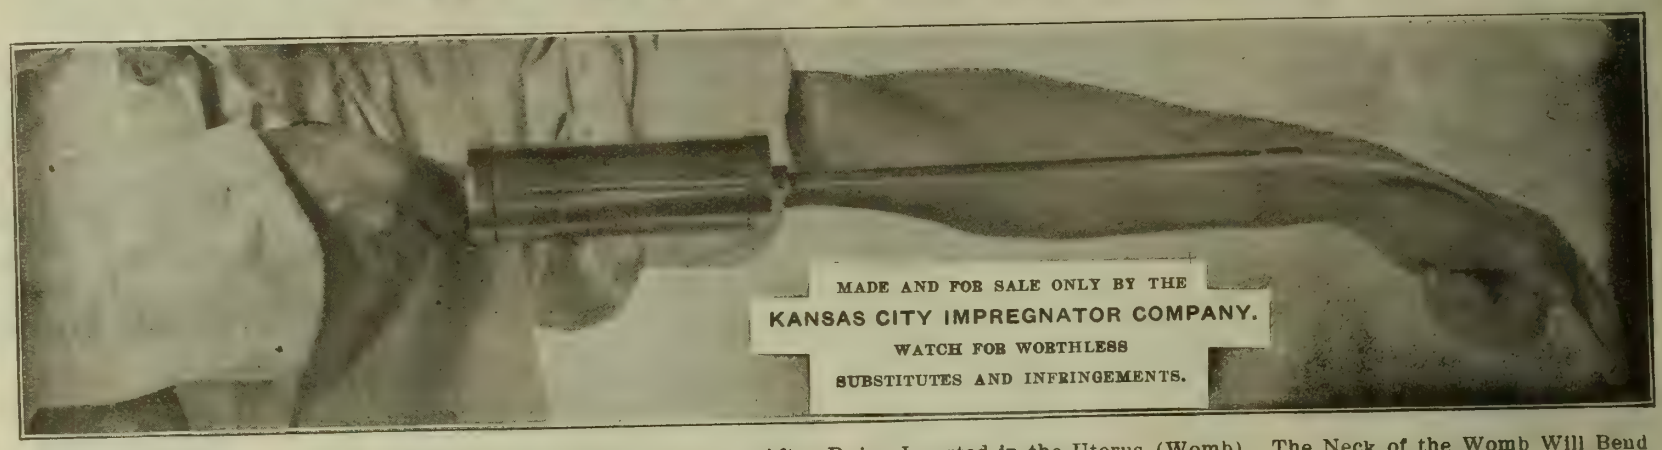
ABSORBINE

will remove them and leave no blemishes. Cures any puff or swelling. Does not blister or remove the hair. Horse can be worked. $2.00 per bottle delivered. Book 6 E free.

ABSORBINE, JR., liniment for mankind. For Boils, Bruises, Old Sores, Swellings, Goitre, Varicose Veins, Varicosities. Allays Pain. Price $1 and $2 a bottle at druggists or delivered. Will tell more if you write. Manufactured only by W. F. YOUNG, P.D.F., 388 Temple St., Springfield, Mass.

WORMS IN HORSES.

Sure Cure.



A well known writer on the horse and its ailments will send you for $2 and a promise of secrecy, a certain and harmless cure for worms in horses. Money returned if remedy is not satisfactory. W. R. Gilbert, Calgary, Alberta, Canada.

Selected Quality

OWL BRAND COTTONSEED MEAL.

No stock feeder should be without it. Feed a balanced ration. Write for our free booklet, "Science of Feeding." F. W. Brode & Company, Memphis, Tenn.

Breeding Appliances of All Kinds

Bending the Soft Metallic Point of the Carlson Semen Extractor After Being Inserted in the Uterus (Womb). The Neck of the Womb Will Bend to Meet These Conditions Without Injury.

The Carlson Semen Extractor and Capsule Syringe

Which can be used as an impregnator or for getting the fluid out of the vagina or uterus for filling capsules. This is the only way to use capsules successfully as 60 per cent of the services inject the semen into the uterus where it cannot be obtained otherwise. The syringe holds 8 ounces of fluid. This instrument is being used successfully by thousands of breeders. It is made of the best metal and can be taken apart easily and boiled, which is the only way breeding instruments can be properly sterilized. As shown in the illustration above, it has a soft metallic point at the end, which can be bent in any direction after it is inserted into the uterus. This is the only instrument that can be used for getting the semen out of the uterus. All necessary directions telling how other breeders are using the Extractor sent with each order.

Price $5.00 For a Limited Time.

Curved Metal Impregnator

This instrument is sold by other dealers for from $5 to $6. It is nickle plated, about 22 inches long, with a glass tube in it. Price $4.00.

Microscopes

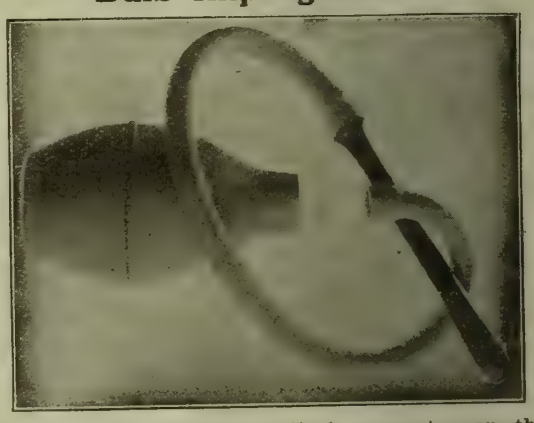
For use in testing the semen of stallions or jacks. Made especially for this purpose. Magnifies 500 times and is used by veterinarians and physicians. Price $35. Boxed in fine case. These instruments are of great value in the breeding business. Through them you can see for yourself and show your mare owner the live spermatozoa of your sire.

Thermometer

Tested and used for keeping water at the right temperature.

Price 75 Cents.

POINTED



Breeding Capsules

We have the only capsules made especially for horse breeding. Some capsules do not dissolve, leaving a foreign substance in the uterus which will prevent conception. Other capsules are too flimsy to use for this purpose. You cannot make any mistake by buying capsules from us as we only have one kind. We have them boxed with 100 in each box. The box is tight so they will be clean. These capsules are properly baked and all bacteria killed before they are mailed. Always keep the lid on the box when not in use. Price per box (100) $1.50

Directions for Ordering

Send money orders or draft as exchange is always charged on personal checks. Always name your express office as well as your post office address in order to insure prompt delivery.

Bulb Impregnator

This is the best bulb impregnator on the market. Some dealers sell for $5 and $6. Price $2.

Breeders' Bags

Three sizes, small, medium and large. Stallions weighing 1,200 to 1,600 pounds usually require a medium size. These bags are guaranteed not to tear from any cause before March 1, 1913. If they do tear before that time return the top part with our stamp on it and 35 cents in cash and we will send you a new bag. Price, Each, $1.00.

Speculum

Made of good material, nickle plated, easily inserted, will last a life-time.

Price $3.00.

Emasculator

This emasculator (improved style) is made by the Kny Scheerer Co., and bears their trade mark. It is guaranteed to give satisfaction. If it breaks within one year or gets out of order, return it and get a new one. This instrument is made of the very best steel. It is the latest method, only having three pieces and can be taken apart very easily and thoroughly sterilized. It operates perfectly. Price, $7.00.

Veterinary Thermometers

This thermometer is recognized and used by the leading veterinarians for taking the temperature of animals. It has a metal case which insures it against breaking and will last a life-time. It has a small chain with pin in it that may be fastened to the vest pocket and carried with safety. Price, $1.25.

POSTAGE AND EXPRESS PAID ON ALL ORDERS.

Beginning of Draft Horse Breeds

Weight in Horses Developed on Flat Rich Lands as a Rule. The True Significance of This Fact. A Mark of the Foundation Horse of Flanders.

It matters not so much when the draft horse of today became transformed from the big black Flanders horse to the present types, but the question of how these changes have come about is important in pointing the way to future advancement.

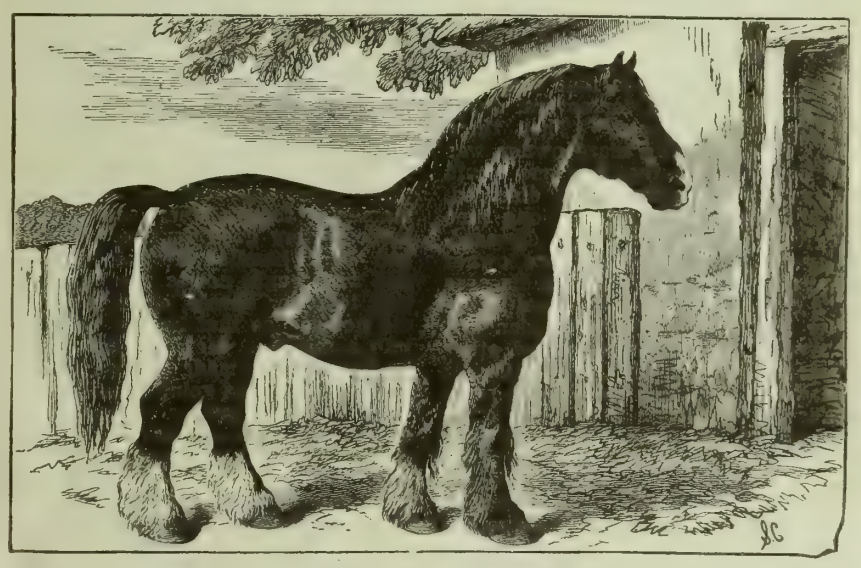
Draft horse size probably originated in these sunken land countries of Belgium and Holland. The type from which it sprung is described as a very large, rough black horse, with some hair on his legs and extremely large, flat feet. This, of course, establishes the fact that large horses were first produced in parts of Belgium and Holland. These horses were produced for food and work. Many centuries ago these horses were consumed in large numbers as food. They lived on coarse feeds, were easy keepers and usually fat.

It seems that the Belgium and Holland draft horses as we know them, have retained these qualities. Times have changed considerably in these two countries during that time as about half of these countries was then a swamp. This possibly accounts for the large, flat feet as the formation of the soil and the amount of moisture in it has much to do with the molding of that part of the animal which comes in contact with the surface as a propeller. It is interesting to note that many of the enclosures in Holland and Belgium, as well as parts of other countries in Europe, are formed by canals or ditches which are always full of water. These canals are usually very deep and serve as fences in most cases.

It seems that the first importation of the big black Flanders horses was made to England about 1140. Then a few years later about one hundred of these large horses were imported to England. The English breeders have used this stock continuously. With a selection of sires suitable to their notion they have created a class of horses that probably breeds as true to breed and type as any other breed, and the breeders of this kind were the first to introduce restrictions on stallions running at large. In order to increase the size of their draft horses the council passed an ordinance that sires under a certain size should not run at large.

The Englishmen can probably claim the honor of producing a breed of draft horses that has had the same breed characteristics longer continuously than any other breed. Belgium had the foundation stock but the size was allowed to decrease until about 200 years ago.

The Boulonnais breed was known as the Belgium horse (as that part of France was then a part of Belgium), so that the difference in type has been brought about by the people who have bred them. The difference between the Boulonnais horse and the Belgium breed has been developed during the last century. This shows what change can take place within a given breed of live stock in the hands of a different people.



But a greater change has taken place in the Percheron breed. The Percherons as we knew them three-quarters of a century ago, weighed on an average, 1,500 pounds, and their use was largely the drawing of heavy loads at a rapid gait. The Frenchmen have greatly increased the size of that breed of horses, largely to accommodate the American trade, but they have never lost sight of the ability to travel at a rapid gait. They have tried to produce a large horse which had clean legs and very alert. This is one of the reasons that the Percheron horse has been so popular in America.

In France there are a half dozen different breeds of draft horses that are supposed to have had about the same origin. This may be accounted for by the fact that those small breeders do not visit other parts of their country as do the Americans, neither have they changed about much, as the custom of that country is to remain on the old homestead as long as possible; the land is sub-divided and handed down to the following generations.

The Clydesdale originated largely from the Shire, or cart horse, blood, but the Scotchmen have not encouraged the coarse growth of hair on the legs or the large, bulky horse that the Englishmen demand. The Scotchman wants an alert animal with good feet, excellent pasterns and hocks, and in this no other heavy breed excels. The Clydesdale breed is not a new breed by any means, for we have records of their large horses dating back several centuries.

The Suffolk horse has an early origin and is an excellent agricultural horse, but the color fad in this breed has greatly limited the production. if an individual did not have the right tint, it was discarded. This breed of horses breeds truer to color than any other.

One peculiarity of the big black Flemish horse, from which all draft types of horses have originated, is that nearly all of them had a large tuft of hair coming out in front of the knee and in front of the hock. The hair was more pronounced on the front legs than the rear. All of the recognized draft breeds of today have animals with this characteristic. Many breeders have tried to breed this out, as they considered it unsightly. The Suffolk breed has less of this than any other and the Shire horses probably have more. Quite frequently a draft stallion having a little bunch of hair in front of the leg under the knee cap, will be found clipped very closely. The owner, possibly, does not realize that this is a mark that has been handed down for many generations, and is evidence that this stallion traces directly to the big black Flanders draft horse. It has been noticed that stallions having this characteristic nearly always produce big, uniform draft colts, so that this unsightly bunch of hair should not lessen the value put upon a good stallion as a producer of large draft colts.

NORFOLK CART HORSE, DODMAN, FOALED 1870.
This Illustration, from Sir Walter Gilbey's Book, "The Great Horse or Shire," Shows the Bunch of Long Hair on the Knee.

This hair can easily be removed to a large degree from any breed (in a few generations) by selecting sires not having this characteristic. As an illustration we take the Suffolk and the Shire breeds of horses which have been developed in the same country, with only a few townships intervening.

The most interesting thing in draft horse development is in the smallness of the sections of country in Europe that have really played a part in bringing to the high state of perfection the excellent types of draft horses. The Fen section of England, the Flemish district of Belgium, the Percheron districts of France, the lowlands of Scotland and the Suffolk country in England, if all put together would not make a territory as large as half of the state of Illinois.

Another interesting thing is that nearly all of these sections are composed of very low lands, excepting the rougher parts of the Percheron district of France. The effect of soil and its production has much to do with maintaining and increasing the size of draft horses. The Flemish district of Belgium where the heavier horses are produced, is very low and fertile —some of it is below sea level and the average farms are about three and one-half acres. The Fen section near Petersborough, England, where the larger framed draft horses are produced, is also a very flat, fertile country. Probably one of the reasons that fertile sections have played their part in maintaining the draft horse's size is the fact that a sufficient amount of nutritious feed is produced—and used. We believe that good draft horses can be produced in any part of the United States if the proper stock is used and is properly fed. Many excellent draft horses have been produced in this country in high altitudes.

Breed characteristics are formed largely by the breeders. For instance, the Frenchman is very careful to produce a horse that has an excellent front appearance. The Percheron is the nicest appearing horse of all the breeds, when viewed from the front. English breeders have not been particular about the beauty of their horses. They have tried to produce a large, rugged horse to perform as much labor as possible with the least expense. The Belgium breeders have paid much attention to the feeding qualities of their horses so they could be maintained as cheaply as possible, using coarse feeds. The Scotchman looks at the feet and pasterns to secure quality and conformation, which will enable the animal to endure a great amount of service without blemish. The Suffolk breeders have produced a breed of horses that all look alike, with very little variation.

Each breed of live stock has its followers. We can learn much from each of these breeds, and a careful comparison as to the good qualities demanded by the American horse buyers, as that trade passes final judgment on all draft geldings produced in this country.

For the encouragement of breeders we again call special attention to the smallness of these breeding districts where draft horses have been produced extensively. This probably accounts for much of the success in producing a particular type with breed characteristics, but the principal improvement of these horses has been brought about by the use of the best sires. More progress could be made in this country if the owners of pure bred draft mares would pay more attention to using better sires and forming horse breeders' associations, such as are found all over Europe, where a number of owners of pure bred mares formed organizations for the purpose of securing an outstanding sire.

There are hundreds of excellent sires in this country that are not being patronized as they should be. For instance, the International Percheron stallion, Imprecation, owned by Crouch & Sons, was imported to this

country at a long price, and his owners will probably lose money from the transaction, because the owners of our pure bred Percheron mares will not pay the price. There are many districts in this country where a dozen or more owners of pure bred draft mares could form an association and buy a high class stallion without its being expensive to any one of them. In Europe the breeders do not hesitate to pay from $5,000 to $25,000 for an outstanding individual. They have found that these purchases are the most profitable when looking for good sires. We hope to see the draft horse breeders in this country form such organizations for the purpose of purchasing individuals and placing them where they can be of the most service to the American draft horse breeders.

ARKANSAS STALLION LAW.

The owner of any male animal, kept for the propagation of his species, shall have a lien upon any female animal and her offspring to which such male so let for the sum contracted therefor, which lien shall attach at the time of service of such male and shall not be lost by reason of any sale, exchange or removal from the county, or other disposition without consent of the person holding the lien, the same may be immediately enforced. Provided; also upon the sale, exchange, removal or disposition of such female animal without consent of person holding the lien or with intent to defraud him, the owner of such female animal shall be guilty of a misdemeanor and upon conviction thereof shall be fined in any sum not less than twenty-five dollars ($25), not more than fifty dollars ($50).

Claims may be filed before justice of the peace. Duties of such officers:

At any time within twenty months after his right of action accrues, the owner of such male animal may file with any justice of the peace in the county, a written statement, duly verified, setting forth amount of his claim, his cause of action, and a description of the animal upon which he has a lien, and the justice shall thereupon issue summons as in other cases and embody therein a description of the animal and an order to the constable to take the animal and her offspring, if there be an offspring, and hold to (her) or them subject to the order of the court.

If upon trial, judgment be rendered for the plaintiff, the court shall order a sale of the animal or animals as on execution sales to pay the judgment and cost, and if bond be given for the retention of the animal or animals the court shall render judgment on the bond against the sureties for the amount of the plaintiff's debt and cost.

Repealing Clause—All laws and parts of laws in conflict with this act, be and the same are hereby repealed.

IS THIS "TOO MUCH" BONE?

To the American Breeder:—I have a jack that will be three years old in July. I got him of Henry Backes, Osage county, Mo. He is registered in the Standard Jack and Jennet Register of America. He is 15¾ hands high; 19-inch arm; 15-inch knee; 9-inch bone below the knee and 18-inch hock. There is a fellow in this neighborhood that tells the people that he has too much bone. Now, I will kindly ask you to answer this letter and tell me if that is too much bone or not. I read the American Breeder and the best I can learn is that a jack does not get too much bone. Hoping to hear from you soon. The jack's name is Black John 2370.—Louis Fent, Osage county, Mo.

Editor's Note—This is a question in which jack men generally are interested, and we would like to print the answers of several to Mr. Fent's question.

Troubles of Stallion Owners

Difficulties They Have to Meet, and How Many of Them May Overcome. Notes From a Trip of Investigation by the Editor.

These are trying days for those who make an effort to please everybody. The writer has visited many breeding barns in order that he might be familiar with present conditions.

A mare was brought to a barn where the writer happened to be recently to be retried nine days after she was bred. The stallion owner was going to retry the mare, and if she was in heat, breed her. But the writer said, "No, this mare should be tried on the twenty-first day after she was bred. It is useless to try these mares back sooner than that." The mare owner took his mare away. The stallion owner says, "Now you have lost me a good customer; this man has four more good mares to breed yet." So the mare owner was located and a conversation started concerning the returning of mares. After a three minutes' talk with this individual he was convinced that the mares should all be returned on the twenty-first day. He said he had never had that explained to him; in fact, he had never given the subject a thought, but that his father and grandfather had always returned the mares for trial on the ninth day after they were tried. He said he was very thankful for the information because it would save him a lot of time and possibly get him more colts.

It is the duty of stallion and jack owners to educate their mare owners and to explain to them that it is their business to get the mares in foal, and that they would gladly rebreed the mares on the ninth day if there was any advantage in it.

Another time a mare was presented that was in a bad diseased condition. The stallion owner was going to breed the mare, but the writer said, "No, if you breed this mare you are liable to infect the other mares that would be bred to this stallion for several days; this mare is diseased." Then there was difficulty. The mare owner was offended to think that any one would say any of his mares were diseased. He had owned this mare a long time and knew that she was not diseased. After an argument the mare owner was asked if he believed that diseases were conveyed from one animal to the other by infection, such as glanders, distemper, chicken cholera and other diseases. He could not deny this, but said that he did not believe his mare diseased. We began to ask him questions about his mare. She had been bred from three to five times every season for four years without raising a colt. The stallion owner produced the books for three years showing the dates of serving this mare, and he could only find where he had collected for one colt from any mare that was bred within five days after the horse had made a service on this mare, and in this case the stallion owner believed that the colt was really from a later rebreeding which he had forgotten to record. The mare owner began to wonder why this mare was not producing foals; thought there might be something the matter with her. The mare owner was asked if he would like to breed one of his clean, young, healthy mares to a stallion within a few days after the stallion had served a diseased mare like his. That made him think even harder. Before the mare owner left with his mare to have her treated, he thanked the writer very much and promised to be more particular about where his mares were bred in the future.

Another mare was presented with a big fine colt. This man owed for service fees for two years and kept promising to pay in a few days. He was wealthy but he did not seem to have time to write a check. After the mare had been tried the writer suggested to the stallion owner that he fill out a note and have it signed in order to get his books straightened up. He presented the note to the mare owner and told him that he was not in any hurry about the money but it was more like business to have a record of such transactions, and asked him when he would like to pay it. The mare owner looked at all of us for a minute and said that he could pay it as well at the present as any time and produced a check and paid the whole bill. He said that he had simply neglected paying the bill.

At another barn where two extra fine stallions were kept for service, several mares were returned to be rebred. The mares looked to be healthy in every way, and after considerable investigation the owner of the stallions said that the mares were coming back very fast—only a few of them were settling. The semen of one of the stallions was tested. It disclosed the fact that there was no live spermatozoa. The other stallion was examined and a few scattering spermatozoa were found. The history of the stallions is that they were not prepared for the breeding season, and when spring started with its warm days, the mares all seemed to come at once. This breeder was like many other breeders, he did not like to see a mare leave his barn without having a hold on her, so he bred everything that came—from two to five times a day. The results are that if he gets 20 per cent of his mares in foal this season he should feel satisfied, as it will probably take some time to get this stock in breeding condition.

At another barn was found a very fine two-year-old Percheron stallion that would not make a service. He had been tried every day for several weeks but would not mount a mare. After watching the colt for a few minutes the bridle was taken off and a long rope tied to the halter. The mare was taken down to a corral where the colt could get quite a distance from any one, and after a few moments, though very awkward, he made a very good service. The colt had been handled around the barn and was taught not to pay any attention to other horses, consequently he did not realize that he had developed into a stallion. He was expecting to be jerked if he made a noise or acted as though he was going to serve.

At another barn a customer had seven big, fine mares, all in good flesh, with only one colt; the others had been bred regularly but were nonproducers. This situation was investigated and two hired hands were found on the place. The owner of these mares was invited to take a walk where we could easily see how the mares were handled in the field. It was not long until we saw where the difficulty was. One of the hands took a notion that his team was not performing to suit him, and they were severely jerked and then received a good whipping. They were doing an enormous amount of work and the implements had seats on them so that the driver could not estimate the amount of work they were doing. The food was shoveled to them with a scoop shovel. If a mare was out of order she worked just the same. After a conversation and a little study of this subject the owner of these mares realized that he was losing about $500 a year as a result of the management of these mares. The worst of the two hired hands was discharged and the other one was instructed that when a mare showed any signs of fatigue that she was to be taken out of the team. He purchased an extra mare so this could be done. It is safe to say that the owner of these mares will be raising colts in the near future.

Another customer in the same community had five mares and each of them had a fine colt. It was interesting to note the difference in the way these two bands of mares had been managed. Those big, fine draft colts were the picture of health and all of them had been broken to lead and were perfectly gentle. In fact, all of the stock on this farm could be caught easily, most of them would follow their owner around. This is one of the best indications that live stock is receiving good treatment when they are not afraid of their keeper.

PERCHERON MARE RAISED 16 COLTS.

In an issue of the American Breeder on the fourth page I read of Wm. Rawlings' mare, Morgan county, Col. I will try to convince him that I had a mare that gave better results than his. She was a black Percheron mare 16 hands and one inch tall; weighed about 1,600 pounds when fat, and was 20 years old last spring. She was the mother of 16 colts, 14 of them being fillies; six of these 16 were mule colts.

The 19th of last May she foaled a black horse colt (the second horse colt she ever foaled) and on the 20th of May I had another mare to foal a mule colt. On the 5th of July, by feeding oats, I choked the mother of the mule to death, and then asked the black mare named Queen, to raise both colts. She did so and would care for the mule just the same as she did her own colt, and after her 20 years of hard struggle I would call on her to go to the field and make half a team, which she would do for a week at a time and step up against a horse five or six years old all day, and raised an ordinary pair of colts. When weaning these colts late last fall she could not forget them and pawed a large hole under the manger one day. She lay down that night and got fast under the manger and beat herself to death. She was with foal by a Shire horse and if she had lived until spring would have been 21 years old and would have foaled 17 colts from 17 covers. She was bred the first time at four years old and never missed a year after that getting in foal by one cover. Up to her death she was spry and a fine looker and could have been passed for a mare of half her age.

I did not own old Queen all of this time, but my neighbor that had her before I got her, bought her at weaning time and she had always been here in our county, and this is known to be the fact. He says he has a pair of mares out of the old Queen mare he has been offered $500 for, and if he knew they would be as good as the old mare, he would not take a thousand dollars for them. He has several others as good as they are. If any one has a mare that has produced more good colts than old Queen I would like to read his advertisement in the American Breeder, as it is the most interesting paper I ever subscribed for and I would not do without it for twice the money.—Lewis W. Reid, Edwards county, Ill.

CAPSULE SYSTEM PROFITS.

To the American Breeder:—I am showing plenty of capsule colts and my business is fine. Will be in the market this fall for a good jack and Percheron stallion.—T. W. Allinder, Faulkner county, Arkansas.

CARRIED FILLY FOAL 12 MONTHS, 17 DAYS.

To the American Breeder:—This record may or may not be of interest to you; if the latter you will know how to dispose of it. April 7, 1911, I bred a mare for a neighbor. About the time she was due to foal, I tried her with the horse and she showed symptoms of being in season and there was not the least sign of bag. My judgment was, she was in foal, but

her owner said she had been in season last fall. April 24 she foaled a filly, just 12 months and 17 days from time of service. I doubted my records then, but the mare owner kept a record also, and it tallied exactly with mine. This mare is 13 or 14 years old and has been raising mules.—A. T. Ling, Weld county, Colorado.

HE BEGAN WHEN THE PAPER DID.

To the American Breeder:—Inclosed find one dollar for which please extend my subscription, as I guess it is about to expire. I have received every copy of your paper that has been published, and if you were to look on your early subscription list, you would find my name among the first. To say that I like the paper would be putting it mildly, for I have gotten information out of it that has made me much actual cash.

I am a young man in the breeding business, but am getting along as fine as any one could expect. I am breeding with capsules this year, although not very heavy, for quite a few don't understand it and object to the capsule system, although I think that I will win out. I capsuled a few mares last year and the first one that I capsuled produced a fine filly this spring.

I would like to write a whole lot but I haven't time now, however, I am going to tell you about a prolific mare that I have. She is thirteen years old now. I gave $125 for her when I bought her and have bred her every year since I bought her and she has been served eight times and produced seven colts, failing one year. But I learned a lesson from the year that she failed to breed. I was too sure that she would settle and I turned her back in the pasture and did not try her any more.

I would like to see a lot of breeders give their experience in breeding. It does me more good than anything to read of others' success and how they made it a success. I think that the success of any business is made after a careful study and a great deal of patience. I keep for public service one imported Percheron stallion and everybody talks about him being so quiet and easily controlled. I hold the stallion and mare both when I am ready for him to serve her and have never had him kicked or gotten kicked, as the case might have been if I had let some excited man or boy hold the mare.—Ross Smalling, Washington county, Tenn.

BAD RESULTS FROM BURDOCK.

To the American Breeder:—In answer to E. W. Ewalt's question in regard to burdock for stallions and mares (April 20 issue), will say that in the spring of 1907 our Clydesdale stallion was a little slow to serve. I read in the ——— ——— where an old horseman said to boil burdock root and feed the root to stallions to make them more keen. I did; it made him more keen, but after two weeks' feeding I noticed something the matter with his water, so I sat in the barn and watched him all afternoon. Every ten or 15 minutes he would strain and pass a little thick urine. I stopped feeding burdock at once and in a few days he was all right. Burdock has the same effect as tansy or Spanish fly (although not so strong), in that it irritates the lining of the urinary organs, thus causing an excitement of the genital organs. I do believe it a good thing to bring a cold, slow mare into a good heat. I should judge pulverized burdock root would have the same effect as the boiled root. If any one uses it for a conditioner will they please report their results to the American Breeder?—Jas. A. Twedie, Iron county, Utah.

If you dislike hogs don't attempt to breed them, as you will make a failure.

Mules, and Market Demand

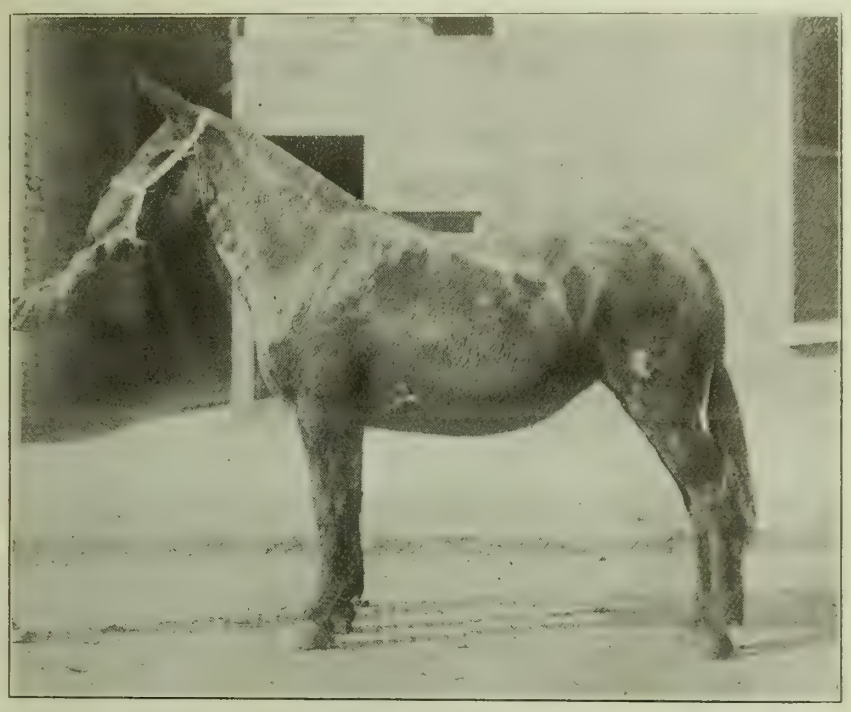
How Mules Are Classed by the Trade. Points Which Count (and Some Which Do Not) With the Men Who Buy.

(Illustration From Mule Market Photographs Made This Season.)

There are seven and one-half million mules in the world—over four million of tehse are in the United States. More than one-half million of these are used in cotton production. Cotton mules greatly depreciated in value last fall as the result of cotton prices going down about a nickel a pound. Many cotton planters were not in a position to buy, owing to the financial condition of the cotton market. During the last few months the cotton market has partially recovered and trade in the small Southern mules has been fairly good.

The larger mules have brought the highest prices ever received. There are many new influences which have brought about these results. Mules are the highest priced of all farm animals, per head. Even good pit mules (which is the smallest class) bring a good price—from $100 to $175, while the common small horses have little value. Breeders of mules should study their production carefully. Many changes are gradually taking place. The demand for larger cotton mules is rapidly increasing. The old plan was to employ a colored laborer to work with each mule. Many of the Southern planters are now using from two to five mules with one driver, and they are using larger machinery, which requires heavier mules.

The method of estimating value of mules by number of hands high, is going out of use. A class of mules may be quoted according to the average height, but the value of two mules may have very little relation to their height. The users of mules are demanding more quality and a better proportioned type—animals that will stand more service. This requires a good, rugged mule with plenty of feeding capacity and good, strong limbs. Blemishes are not as important with mules as with horses, so long as they do not interfere with their working capacity. That is, a mule may have one eye out or a bad wire mark and still be saleable. Age in mules does not depress their value as rapidly as with horses.



The selling territory for mules, however, is limited largely to the Central and Southern states, as they are not suitable for team work in heavy snows, owing to the smallness of their feet. Neither are they as good in mud. If the jack breeders had paid more attention to producing jacks with large feet instead of to the color craze which has been in effect in this country for a quarter of a century, mules could have had a more prominent place as draft animals in the Northern states.

At the leading mule markets mules are not sold at auction, the same as horses, but they are sold by pens. It is not an uncommon sight to see several thousand mules at either Kansas City or St. Louis at one time. A buyer usually decides on the number of mules he wishes to purchase and the price is agreed on per head for all, or the tops, of a certain pen, or several pens.

The larger mule firms have buyers who travel through the country and ship what they buy to their large feeding barns where they are placed on full feed. There is very little danger of mules being foundered when in a feeding barn. Neither are they liable to blemish by fighting. A particular type is purchased at a certain time of the season, as nearly as possible, to prepare them for a certain market. Cotton mules are purchased early in the fall so that they can be prepared for the cotton buyers, which begin late in the fall and early winter. Most of the heavy mules are prepared for the early spring season. Mule dealers do not care to buy thin cotton mules in the spring as they would have to be held too long before they can realize on them.

The color of mules receives little consideration. There are a few extreme Southern states that favor cotton mules which are black with white points. We never could understand why this color fad came into existence as it is generally understood that a white or gray mule can stand the heat in the extreme Southern states better than darker colors. At any rate this is the only section of the world where these requirements exist. In Spain where the jack stock has been bred longer than anywhere else, bay or brown mules have the preference and a sorrel is not objectionable, even for army purposes. Among the large mules in America, the steel grey mule has the preference, if any, but there is very little difference so far as color is concerned. The demand is for a good mule that can perform much service as a slave.

In the mule market of this country there is less criticism offered concerning the color than possibly with any other class of live stock, yet a lot of jack breeders would lead us to believe that if a mule was not black with white points, he could not be sold for any price. This is purely ignorance and any one making such a statement should be laughed at. A few men have seriously injured the mule production in this country by trying to limit the color of mules to one particular color. These fads should be dispensed with as soon as possible. What the mule industry wants is a big, well proportioned mule, regardless of color, The jack stock in this country has been so badly mixed that it would be impossible to even control the color of jacks, much less the mules that are produced from mares of all colors.

DRAFT MULE, 16¼ HANDS, 1,350 POUNDS, WORTH $235.
Other Market Classes Illustrated on pages 6, 16, 17 and 18.

JACK AND STALLION SORE REMEDY.

I notice that Mr. O. P. Wilson has an ad in your paper; that he guarantees to cure every sore on either jack or horses' legs. I have a horse with a bad leg and would like to try his treatment. Where can I get his medicine, and what is the price of it?—D. L. Olson Co., Sanpete County, Utah.

You will find the O. P. Wilson Serum and Instrument Company's advertisement in this issue. Jack Sorine is guaranteed by this firm to cure any sore on the legs of any stallion or jack, or the purchase price refunded. The price is $5 per can.

FERTILIZED BY SEMEN 23 DAYS OLD?

To the American Breeder:—I have had an experience in breeding that I think will be of interest to your readers, and is probably something unusual. I bred a mare to my jack for the D. J. Fair Lumber Co. of this place on April 21, 1911. On May 17 (23 days later), she was in heat again. They wished to change her to one of my horses. I made a natural service on her with the horse and took semen from her and bred another mare artificially. Both the mares had mule colts this spring. The mare that was bred artificially never had been bred to a jack and had no chance to get with one, as she was owned in town and kept in a city lot.

Now, the way that I account for this is that the mare which was bred to the jack for some reason failed to get in foal at the first heat period, and the semen lay in the uterus until she came in again and then she conceived from the jack semen, and in extracting the semen to breed the other mare, I got some of the jack semen and impregnated her. Anyway we got a mule colt from a mare that never had been bred to a jack.—D. M. Barber & Son, Rice county, Kansas.

"CAPSULED" 87 MARES PER WEEK

To the American Breeder:—Everything is working well here and have had as high as 87 mares per week—the highest number per day being 25. Am making two stands this season. Monday, Wednesday and Friday at Franklin, the county seat of Johnson county, and Tuesday, Thursday and Saturday here at home. The ten-mile walk on Monday, Wednesday and Friday seems to be just the thing for the horses and jack, and by testing every discharge this season, I find the sperm cells have much more life and vitality than I have ever seen before. I capsule every mare that comes to the barn, and find by the return mares that we are having very good success. With the capsule method last year our jack bred 86 per cent and one of our horses 89 per cent, so I think I have something to be proud of, even if the work is, so-called "stud hoss work."—Roy E. Graham, Johnson county, Indiana.

QUESTIONS
AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

DEAD COLTS—Mares that have been regular breeders here have been foaling dead colts this spring and our veterinary cannot tell us the cause. Would like to have this question answered in The American Breeder—Ohio Subscriber.

REPLY—Questions of this character can not be very satisfactorily answered without more definite information as to conditions in the locality. Oftentimes the trouble may be traced to certain methods of feeding, the housing, contamination from stallions, etc.

OKLAHOMA LAW—I am a horse and jack owner and live in Oklahoma and would like to know the law on horse breeding collection of service fee. You can answer through the paper.—Oklahoma Subscriber.

REPLY—Oklahoma has no stallion collection law. You can sue on this debt the same as any other common debt. If the party whom you sue, and get a judgment against, has over $5,000 worth of property, you can force collection of your debt.

LOSS OF HAIR—I have a coming 3-year-old jack; he has hardly any hair on the end of his tail. What shall I do for him?—Kentucky Subscriber.

REPLY—Bathe the parts devoid of hair with the following: Alcohol four ounces, tincture of cantharides thirty drops, water to make eight ounces.

A BITING STALLION—What is best to do to correct the habit of biting in my stallion, which is very valuable only for that fault?—Wisconsin Subscriber.

REPLY—If your stallion has a habit of nipping, get a good raw hide whip and when he makes a grab at you, wear him out a few times, but be careful that he is securely tied before the operation begins. Occasionally a stallion will not stand this kind of treatment. Some breeders have a club about two feet long which the caretaker holds behind him out of view of the stallion. When the stallion gets to nipping he hits him a good hard swipe under the chin; if the stallion fails to nip he teases him a little so that he can have a chance to hit him again. After a few swipes under the chin he will conclude that he is going to get another swipe.

CHRONIC LYMPHANGITIS—I have a 6-year-old pacing mare that suffered from an attack of lymphangitis in her right hind leg about two months ago. Her ankle and pastern are still swollen and sore, and when driven on a hard road shows lameness. Please advise me what to do to relieve these conditions.—New York Subscriber.

REPLY—You are doing wrong in driving your mare on the hard roads when it causes lameness. She should have exercise and the best place for her is in a pasture. Rub and massage the limb for fifteen minutes a day, applying at the time a mixture of equal parts of alcohol and witch hazel. If you have the courage and patience in following this advice you will in the course of time improve considerably the appearance of the limb and cause the lameness, if due to the lymphangitis, to subside.

CONCEPTION IN MULES—Why will a mule not breed? I have been asked the question and have not been able to answer.—Pennsylvania Subscriber.

REPLY—Many theories are advanced why mules do not breed, but we do not know.

PERIODIC OPHTHALMIA—I have a stallion, coming five in the spring. He is a fine stallion, only I noticed some time ago that the sight of one eye was enlarged. It got milky and little veins appeared all over it, and he could see but very little. His eye did not water, and it cleared up and was just as good as ever. In about a month I plowed with him and another stallion. They were soft and got very hot. I hadn't noticed anything the matter with his eye before I plowed, but in a day or two he was nearly blind, and the left eye was the worst—the one that had first got milky. His eyes did not water hardly any, and they cleared up in two weeks. Two or three months later I was feeding them horse weeds, as they like them, and his eyes got milky again, acting as before. I thought they got poisoned that time. I noticed that he had blind teeth. I spoke to a veterinary and he said the teeth did not have anything to do with his eyes. He has nice big eyes, and the sink over the eye is full. I mowed all fall with him, and he has no appearance of weak eyes. About a month ago I knocked a big blind tooth out, as it was worn off at the end and rubbing the other teeth. The other one was gone. The tooth was sewed to the bone, and it was on the side that the eye was worse. Some tell me that blind teeth work on a cord that runs to the eye, and after they are taken out or get tight they won't bother. This horse is awful greedy and bumps his head in eating and in sticking his head through a crack in the manger has bumped his eyes several times. He will reach through after feed and to bite at the other horse, as I have the two stallions stand facing each other, separated by a partition made of strips. What is your idea about his eyes?—Kansas Subscriber.

REPLY—We suspect that your stallion is affected with periodic ophthalmia and that it is only a question of time when you will have a blind horse. Submit him to a careful examination at the hands of a qualified veterinarian. The notion that there is a particular cord connecting the eye with the fang of the wolf tooth, is one of those fallacies that has been handed down through the ages for generations. The most careful research in the dissecting room has failed to disclose this mysterious connection.

FARM MULE, 16 HANDS, 1,200 POUNDS, WORTH $210.
See "Mules and Market Demand," page 5.

IN-BREEDING—I have a pure-bred Percheron horse and his colts will be old enough to breed in the spring. Would you advise to breed the horse to his own colts?—Montana Subscriber.

REPLY—We would not advise breeding a stallion back to his fillies.

BOGGY HOCK—I have a young stallion that has a soft growth high up in front of hock joint. He never has been lame and at times it seems to get smaller; never has been large, but it is in a place where it shows plain. If you can recommend a treatment that will establish a cure, it would be greatly appreciated.—Missouri Subscriber.

REPLY—Inasmuch as your stallion is not lame from the enlargement we would not advise you to give it treatment at this time other than hand rubbing with alcohol once or twice a day. These enlargements are very difficult to remove.

GRADE PERCHERON—I have a fine black Percheron; he is out of an imported horse; his dam was from Sheffield, Ill.; he is 15-16 Percheron; 1-16 Morgan. Will you please tell how would be the best way to advertise him for service as I am going to make two stands with him. Would it be best to advertise him 15-16 or else say Percheron stallion?—Oklahoma Subscriber.

REPLY—It would be better to say fifteen-sixteenth Percheron; then all intelligent mare owners would know that it was a grade and that you were not trying to deceive them. All breeders that expect to hold their customers can not afford to misrepresent their stock.

HAIR FALLS OUT—Will you please tell me what to do for my stallion? The hair comes out of his mane and tail; his hide is covered with white scales like dandruff on a man's head. Is there anything I can do for my stallion to make his hair grow again?—North Dakota Subscriber.

REPLY—First observe that the stallion is properly fed and exercised. The animal should be given an opportunity to graze on a clean grass plat or have grass mown and thrown to him daily. Give a half ounce of Fowler's Solution mixed with the grain ration three times a day. Locally wash the parts with kerosene emulsion. For this purpose one can make up a gallon of warm soap suds, using castile soap and rain water for the purpose, and to this may be added two table spoonfuls of kerosene. Scrub the parts with this mixture, keeping the mixture agitated while applying so as to encourage the kerosene mixing with the soap and water. Do not rinse the parts but dry slowly with clean cloths. Be careful that all curry combs, brushes and other grooming appliances are clean.

JENNET GESTATION—I would like for you to give me some information concerning the time a jennet will go before foaling, as I am in a dispute over a jenny that I bred that went a little over 11 months—the man claiming that they went 13 months and would not pay for it.—Iowa Subscriber.

REPLY—Jennets carry the fetus a few days longer than mares, which is about eleven months.

SORE SHOULDERS—I have a mare that has sore shoulders and I cannot heal them up. In the spring she looks all right, but as soon as I work her a day or so she gets sore; the hide and hair the size of a dollar or bigger, comes off and the sore smells terribly. I have cut them open and washed them out, but it is no use, I cannot cure them. What can I do for them?—North Dakota Subscriber.

REPLY—The parts have become thickened from the chronic inflammation so that too much collar pressure is given at this particular point. For temporary relief take your collar to the harness maker and have him take out some of the packing immediately over the sores. Remove the harness when the animal is in the barn and wash the shoulders noon and night with cold water to which some table salt has been added. Rub a little calomel into the wounds three times a day. If you can not heal them up under this treatment it will be necessary to have a qualified surgeon remove the growths entirely.

COLLECTING SERVICE FEE—I am owner of a Percheron stallion and a man bred his mare to this horse four times, the last time being May 29, 1910, and three weeks later he bred her to his own horse. In February, 1911, this mare had twin colts, the owner claiming they were from my horse until I took steps to collect for services, then he claimed they were from his horse. Now, I wish you would let me know if I could collect for this service or not.—Colorado Subscriber.

REPLY—If you have your dates correct you can sue him and force him to prove that the colts were sired by his horse. It is probable that the mare got in foal at one of the former services from your horse. We do not believe that service made in the latter part of June would produce normal twin foals in February.

DIFFICULTY IN FOALING—I have two mares, one coming five years old and the other coming eleven, that attempted to give birth to their first colts this week, both going over time about four weeks, and both colts hind legs were doubled up to their stomachs and their ankles bent back, not allowing the colts to pass through, only about half way. They had to be cut in two and part pushed back in and the hind legs straightened. Both colts died in a few minutes after starting. Can you give me a reason for this, and tell me how to treat the mares, as they are swollen badly about the vagina. Would it be policy to breed these mares again, and how soon?—Kansas Subscriber.

REPLY—No particular reason can be given for a foal being presented in an abnormal manner. You need a careful veterinarian to treat the injured vagina tract which was caused by bruising and perhaps lacerating the parts during delivery. There is great danger of serious infection occurring in such cases.

SADDLE GAITS—What are considered all the saddle gaits?—West Virginia Subscriber.

REPLY—Walk, canter, trat, single foot, slow pace or rack.

LACERATION—One of my customers have a young mare that foaled a mule colt this spring, two weeks before time, and it was dead. Upon examination I find that the valeing that envelops the mouth of the womb has been torn off, and occasionally she makes a noise when moving about. Would it be safe to breed her, and would she get in foal in that condition?—Kentucky Subscriber.

REPLY—it is evident that the mare suffered a laceration of the cervix at the time of foaling and perhaps the tear is even more extensive than you describe. It is not likely that any particular danger would attend breeding her, especially with capsule, and as to whether or not she would get in foal would be a question of trial.

JACK MEASURE—Is there any difference in the hand measure of a jack than a horse? I have always thought four inches was a hand to measure either animal.—Oklahoma Subscriber.

REPLY—There is only one way to measure horses, mules or jacks, and that is from the ground to a level with the highest point of the wethers, counting four inches to a hand. There is a custom, however, among jack breeders to measure tape line measure from the ground to the highest central part of the wethers. This is called jack measure. This custom was probable adopted to meet the demand of those who are in the market for a 16-hand jack. There are a very small number of jacks in the world 16 hands high, standard measure, that have any value as mule producers. Jacks 14½ hands high with plenty of body and bone are usually better mule producers than jacks 16 hands high, standard measure. The demand for 16-hand jacks has caused the jack breeders to forget that all beasts of burden must be of a well proportioned type.

FAILS TO BREED—I have a gray mare 8 years old, weight 1,550 pounds, that has raised two colts. In giving birth to the second she threw her

womb out. Since then, I have not been able to get her in foal. What can I do to get her to breed again?—Kansas Subscriber.

REPLY—It is very likely that the womb was injured at the time of the eversion and that some abnormal condition remains that would require an examination by one expert in these matters to detect. Until the trouble is definitely located we do not think we are justified in outlining any definite line of treatment.

REFUSES TO SERVE WET MARES—I have a registered Percheron stallion 5 years old, that is ready to serve mares except those with young colts. He can tell the difference and I sometimes have to wait a long time before he will serve them. Have not found any but what he would serve by waiting. He seems to be just as sure with these as with the ones he serves right away. As I have only the one I have to try the mares with him. Can you tell me how to get him to serve these mares as promptly as the ones with no colts?—Indiana Subscriber.

REPLY—If any of our readers have had any experience of this kind we would be glad to have them answer this question.

INJURED LIMB—I have a horse 6 years old, got lame last year in June, by being caught with a rope by the left foot, and his left shoulder went dry two months after that. He has been lame ever since. The horse has not been used one day in all this time. —New Mexico Subscriber.

REPLY—We suspect the animal has suffered a very severe injury and there is a strong probability that the case is incurable. Would suggest, however, that you permit some qualified veterinarian to give him a careful examination with a view of locating the injury. By so doing you will perhaps learn whether or not you are justified in undertaking treatment.

BOG SPAVIN—Is it advisable to blister a 22-months-old animal's hock that has suddenly developed a bog spavin and shows no lameness? And is there a possibility of her outgrowing it? She is a range filly and has been kept in the barn but very little. —Wyoming Subscriber.

REPLY—We do not often favor treating these cases of bog spavin in young animals when lameness is not present, except with mild agents. You will please note what is said under the inquiry entitled "boggy hocks."

NUMEROUS ABSCESSES—I have a large black mare, registered, weight 1,800 pounds. On the 22d day of August, 1911, she foaled a large black horse colt. I watched the mare and was there when the colt was foaled. The colt seemed right in every way with the exception of its navel was about eight inches long. As large as a good sized ear of corn, looked red and was very sore. The colt sucked well from the start, but the next day he seemed very stiff, unable to bend his neck or get up alone. I helped him up about every two or three hours day and night for five days. He then got up alone and did very well and when seven weeks old weighed 400 pounds. All the time it seemed right in every way. I cauterized the navel several times and it dried up and dropped off when the colt was about two weeks old. The day he was seven weeks old I noticed he was slightly lame in the left hind leg. The next day I had a competent veterinarian look him over and he was unable to locate the cause of the lameness, unless it was in the hip. I had another veterinary look at him two weeks later, a large swelling had then formed just below the hip and above the stifle. He thought the mare had tramped on the colt's leg and it would perhaps break. He told me to bathe the affected parts with turpentine and alcohol, which I did. The colt was now unable to get up and losing flesh, but could stand up after being helped up. By the 5th of November the swelling extended from the foot to the shoulder on the left side and a slight swelling appeared on the right leg just in front and above the hock. The swelling was so large on the left flank it almost touched the ground when the colt was standing up. I then cut it open on the left hind leg high up and let out pus, then the colt seemed much better and gained for about a week. Then the leg swelled up again just above the hock. I have opened this three times letting out lots of pus. These wounds are all healed now, the left hind leg is some larger from the hock to the stifle, but has quit running. The slight enlargement on the right leg is still there. The colt feeds and feels well. Has good action in all his legs and now has the appearance of a perfect healthy colt. The 22d of this month weighed 450 pounds, the day he was four months old. What was the cause of the trouble and what

(Continued on page 13.)

Owned by American Breeders

Actual Ownership Interest in This Paper Being Secured by Breeders Who Are Helping Make It (As Their Paper) the Greatest of Its Kind. Every Breeder Asked to Take Part.

As the early readers of this paper well know, the first few years of its publication were crowded full of work. There seemed to be thousands of people waiting for just such a paper—and we heard from them all. The fact that we were working along new lines and furnishing information which other live stock papers had never attempted, brought us inquiries and subscriptions in such floods that there was no time to think of organizing a plant on a large enough scale for the future. The past six months our subscription receipts, and the space and labor necessary for handling subscribers' communications have increased at a faster rate than ever before, and it is imperative that we materially increase our publication facilities before the busy season begins again in the fall. This increasing of equipment is going to give us opportunity for carrying out a plan we had in mind when this company was incorporated.

The Graham Publishing Company was incorporated for $50,000 for the purpose of publishing the Stallion and Jack News, then a monthly paper, which has since been enlarged, and, as the American Breeder, is now issued twice monthly. Frank B. Graham, at the time of the incorporation, set aside $10,000 worth of non-assessable stock to be used when needed in developing the American Breeder. He believed then (and has since made sure) that it might some day meet with favor if we would ask a large number of breeders to join with us in the ownership of this business. As a test, small blocks of stock (none of them costing over $500) were sold to each of several breeders. These gentlemen are not only satisfied (having received 6 per cent annually on money they were making no use of at all) but they have helped their own business materially. No effort was put forth to make a sale of this stock. The paper was then comparatively new and only a few of the far-seeing readers thought of what its future might be. But the paper is now well established as the recognized and leading authority on all live stock breeding subjects.

We have been so well pleased with the work and influence of these stockholders, that we want more of them. If a breeder owns stock, he is doubly a "booster" for our (his) paper. Several of these stockholders who owned only one share, have brought in as high as 100 subscribers each. It is to their interest to do this, for they are making money for themselves. This experience has resulted in the Graham Publishing Company deciding to sell at once the balance of the $10,000 worth of stock, for the purpose of increasing the publication facilities. This stock has a double guarantee; first, it will draw at least 6 per cent interest; second, the purchaser has the privilege of returning the stock to the Graham Publishing Company and receiving full purchase price with the 6 per cent increase, within two years from date of purchase. We want stockholders scattered all over the country who will be interested in the American Breeder, and we want every share of this stock in the American Breeder to be owned by a breeder. This is a breeders' paper and its ownership must remain with, and in sympathy with, the breeders of this country.

A limit is placed on this stock so that no one can buy over $500 worth. No stock is for sale at any price except the remainder of this $10,000 worth of preferred, double guaranteed stock. This investment is perfectly safe and if the purchaser decides that he could use the money to a better advantage within two years, all he has to do is to surrender the stock to the Graham Publishing Company and receive full purchase price with 6 per cent interest from date of purchase. No questions will be asked, but the money will be refunded. Within two years a breeder can decide whether he wants to keep the stock longer or not. There are many breeders throughout the country who have surplus money that is not drawing any interest. This is much better than a time deposit in any bank, as the money can be had any time; the only restriction we put on the purchase of this is to know that the buyer of this stock is actively engaged in live stock breeding.

This $10,000 worth of stock is guaranteed by the other $40,000 worth of stock. In other words, those who purchase any part of the $10,000 preferred stock must receive their dividend of 6 per cent before the stockholders of the other $40,000 receive anything, and whenever the earnings exceed 6 per cent this stock will draw its share. We are making this inducement in order to interest the breeders so that they will have a working interest with us. We will sell in any amounts from one share at $10, up to 50 shares for $500.

Those who have been reading the American Breeder know what progress it has made and it needs no introduction to them. As a business proposition the advertisers of live stock realize the pulling power of this paper and send their advertising direct to the office, which means an important saving in the expense of this department. All other newspapers that have much live stock advertising are compelled to keep men traveling over the country at a big cost for expenses and salary. One of the reasons we are able to get advertising without sending out traveling solicitors is that our subscribers read the paper closely and have faith in it. There is probably no newspaper in the country that is read so closely by the breeders. This will always be an important feature in the business strength of the Ameircan Breeder, for in the end all advertising prestige is the result of editorial superiority.

As we said before, we will not sell any one breeder over $500 worth, and will not sell to any one excepting a breeder, or one especially interested in good live stock. We prefer to sell to breeders who live near enough to Kansas City to acquaint themselves with all conditions here, but of course this offer will be good wherever the American Breeder circulates—and that means 47 of our 48 states, and in Hawaii, Cuba, Brazil, Canada, Mexico, France, Belgium and England.

Now, let us make quick work of transferring these shares in the American Breeder, to more of the actual breeders themselves, and be ready for the bigger work ahead. This step, while it may not seem so very important to the man who puts 100 to 500 idle dollars in it now, has a chance to prove one of the best investments he ever made and the big factor in hastening the day when the American Breeder will be recognized internationally, as the leading advocate of live stock improvement, and of the square deal in all live stock organization affairs.

On the back cover page is a blank form convenient for use in making an order for the number of shares desired—or an order by letter covering the same ground will answer just as well.

Arrangements have been made by C. A. Conway, a widely known manager of range horse sales, for a series of sales to be held at Gillette, Wyoming, on a large scale. The stock yards at Gillette have been enlarged and especially rearranged to facilitate the handling of range horse business on a large scale. The sales will begin some time this summer and continue at intervals through the fall until cold weather.

WHAT THIS BIG DEPARTMENT MEANS.

Publishers of live stock papers have long recognized the fact that the amount of subscribers' correspondence received by a paper is a fair measure of the esteem in which it is held. The reliability of the information which papers give out in answer to subscribers' inquiries can be pretty well judged by the rate of growth of the department in which this correspondence is handled. Every time an experienced publisher gets hold of a new publication he turns the energies of his editorial department into securing the interest and confidence of the readers, and the number and contents of the columns of reading matter which result from such efforts is taken as the measure of the editor's success.

While readers of the American Breeder have gotten so in the habit of writing to this paper for any information they want or to discuss any question that comes up in their business, that they possibly do not think it remarkable when they find column after column devoted to this correspondence, publishers and experienced newspaper men everywhere are noticing it with wonder. The last issue of the American Breeder contained 17 columns of these questions and answers. No other live stock or agricultural paper has ever shown anything like such an evidence of widespread interest and confidence. The building up of this department has come gradually and without any special effort on the part of the American Breeder, excepting that in all cases the utmost pains has been exercised to make the answers and disbussion of every question practical and reliable. Although the present issue of the American Breeder has been compiled at such a busy time that it would be little wonder if the letters were few and far between, the amount of inquiries which we have received and answered in this issue is hardly less remarkable than before.

Certainly there could be no surer proof that the American Breeder is pre-eminently the paper of the breeders in this great territory.

NEW ANIMAL HUSBANDMAN FOR KANSAS.

The Agricultural College at Manhattan, Kas., has a new head to its department of animal husbandry, Prof. Wilbur A. Cochel having been brought from the corresponding department of the Pennsylvania Agricultural College to fill this position. Prof. Cochel, while a native of Indiana, attended the Agricultural College of Missouri, where he graduated, having first taken the general arts course in the Missouri University. Since his graduation at Columbia he has done important work in connection with the World's Fair at St. Louis, the Purdue University in Indiana, and the Indiana Cattle Feeders' Association. His work in Pennsylvania thoroughly demonstrates his desirability for the position to which he has been elected.

SUCCESSFUL BREEDER.

To the American Breeder:—I am getting along fine; have booked as high as $230 in one day. The capsule system is the only way to breed.—T. E. Collins, Republic county, Kansas.

Steigleder Bros., Bunceton, Mo., report a sale of two fine jacks to L. M. Monsees & Sons, Smithton, Mo., at $1,000 each.

It is better to feed hogs at a regular time.

THE AMERICAN BREEDER

With which is combined
THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE
Editors.

Published semi-monthly (on the 5th and 20th of each month) by the
GRAHAM PUBLISHING COMPANY,
INCORPORATED.
225 WEST TWELFTH STREET.
Kansas City, Mo.
BELL TELEPHONE, 4297 GRAND.

All communications for this paper should be addressed to the American Breeder, or the Graham Publishing Company, and not to individuals.

Advertising Rates On Application.

Subscription Rates.

To all points in the United States and Mexico, per annum, 50c; 3 years, $1, payable in advance.

To all points in Canada, per annum, in advance, 75c.

To all foreign points (in the International Postal Union), per annum, in advance (6 francs, 5 shillings), or $1.15.

When sending subscriptions, please state whether they are renewals or new ones. Always renew under the same name and initials as previously used, and at least two weeks before your present subscription expires, so that you will not miss any number. When changing your postoffice address, state the old address as well as the new one.

Watch the wrappers on your paper. The month before your subscription expires they are stamped "your subscription expires with next issue," and on the following edition is stamped "your subscription expires with this issue." When the time for which the AMERICAN BREEDER is ordered has expired, it is always discontinued.

If you miss your paper please notify us at once and all lost copies will be replaced.

Entered as second class matter, November 23, 1911, at the postoffice at Kansas City, Mo., under the act of March 3, 1879.

Copyright, 1912, by the Graham Publishing Co.

All persons are warned not to reprint any part of this paper during 1912, without giving full credit for the same to the American Breeder, Kansas City, Mo.

COLLECTING SERVICE FEES.

Different localities have their own peculiar problems. In a district where the farmers own their own farms, and farming is in a settled condition with a regular production of good crops, the collection proposition is not as serious as in those sections where the majority of the farmers are renters, and move nearly every year. In the permanently settled sections, the plan of many stallion owners is to place their accounts in the bank at the close of the breeding season. Occasionally one is offended by having the bank send him a notice, but they usually get accustomed to this method of collection. Most people like to have their credit good at the bank and do not care to be receiving notices through that medium, which usually results in an early collection.

Those doing business in a community where the business is largely transient, are forced to take notes. They may or may not be secured. We have frequently heard men say they never lost anything in the collection of service fees. But we want to say that those men are very scarce that never do lose any money.

The laws on collection of service fees are very bad. We have been thinking for some time that a campaign should be started for better collection laws in most of the states. Those who have been prominent in introducing stallion inspection laws could just as well have included the Utah collection law. We thought at one time that the need of this arrangement was generally understood, as it would be a redeeming feature for some of the stallion inspection laws if this clause was included.

It is generally admitted that one regulations should not operate against other important features. There is no reason why the Utah collection law should not be included in every stallion inspection law in this country. The Utah law gives a preference lien on the mare and colt for 18 months after the mare has been bred, without the filing of any claims. This is what the horse breeders deserve. It would be a great benefit to the mare owner if the stallion owner would not be forced to make any collection until the colt is nearly seven months of age. This would give the mare owner plenty of time to pay the honest debt if he intended to, without crowding him. The stallion owner would be sure of his money. That is all any of them want and they are entitled to it, and we expect to see that they have a fair show in this matter.

Those who claim to be so deeply interested in the improvement of the live stock in this country, must not lose sight of the fact that stallion and jack owners must collect their service fees or they will not be able to buy the best sires. The fact that about 20 per cent of the net earnings of the stallions and jacks in this country is lost, should be evidence that a substantial law is needed in every state for their protection. Since the Utah law went into effect, there has been quite a number of other laws introduced and passed without making mention of the service fees. If the stallion and jack owners of this country will make an effort to have the Utah clause included in every stallion inspection law in this country, they can have a voice that will be heard in every legislative assembly in the country.

Let us all pull together for a Utah clause in every state in the Union where horses are bred extensively. If we can have the hearty support of all the stallion and jack owners, the Utah clause will be adopted.

IMPORTERS GOING TO EUROPE.

It is interesting to notice how quietly some of the importers leave this country to purchase horses. No one knows they are going to leave or where they are until they are discovered out in the rural districts of some of the draft horse sections of England. Some of them do not want their competitors to know that they are going to invade some new section in the hopes of finding an outstanding individual at a reasonable price before some other fellow beats him to it. But by the end of this month nearly all of the importers will be in Europe. They will first assemble at the Belgium Horse Show at Brussels, then wend their way over to Paris, where the big Paris Exposition will be held; from there to the Nogent Percheron Show and back to England to attend the Royal Agricultural Display. There are many other smaller shows, but these are the most important. They have all had their interpreters scouring through the draft horse sections locating the best individuals for the American trade. Last season the importers did not buy as heavily as in former years, consequently most of them have sold out closely excepting those who have brought in new horses this spring. Some of the importers, however, do not confine themselves to any particular season, but bring over horses during the entire year.

HORSE VALUES.

Another surprise is in store for those who have been predicting that horses would get cheaper. A few individuals have been making this prediction for several years, but the horse market shows that the best individuals have sold for more money during the past few weeks than has ever been reported in American history.

Horsemen who deal in both pure breds and geldings, predict that the market will continue good for many years for the best individuals. We believe this is correct, as the entire country is short of horses, not only in America, but all over Europe. The writer investigated the demand for geldings in six foreign countries last year and all of them reported a shortage.

SELF FEEDER FOR STALLIONS.

While grain is so high, the owner of every animal should see that all feed is used to the best advantage. Quite frequently stallions throw out a lot of feed: others eat too rapidly, not thoroughly masticating their food, which interferes with the digestive tract, and often results in sickness. Anyone can make a self feeder, or an arrangement whereby the animal must eat slowly. The feed box should be larger than is ordinarily used, and a chute should be made where the feed can be put in at the top, and an opening at the bottom which should be from three-fourths of an inch to an inch, where the feed can run out of the chute into the feed box, then as the animal consumes the feed which has run into the box, more of it will gradually empty into the feed box.

It is not necessary that this arrangement should be expensive. One should avoid using material that will splinter easily. This self feeder can only be used for small grain and ground or shelled corn. This requires an animal to eat slowly and avoids all rooting, and the animal will derive the full benefit from the feed. Every animal should be fed in an arrangement of this kind, and more especially stallions and jacks, as they do not get as much exercise as they should have, and they should be required to eat slowly.

All feed should be fed to stallions or jacks dry, as a rule. It is not necessary to soak the feed of a stallion or jack that is in a healthy condition. The lumber in the self feeder should be purchased for less than a dollar, and it will often pay for itself every month. The feed box should be thoroughly cleaned before each meal, not allowing any accumulation in the corners of the box, more especially if ground feed is used, as it is liable to sour and cause trouble along the digestive tract.

RENEWING SUBSCRIPTIONS.

During the past few weeks we have received several complaints from our readers about not getting their paper soon after renewing their subscription. It usuually takes about two weeks' time for a renewal or a new subscription to be properly placed on our mailing list, but this spring we have been severely crowded as the subscriptions have surpassed all records. Another difficulty has been the late spring, causing many stallion owners to be slow sending in their renewals. Nearly every one of these had a request to not miss a single issue. It has taken a lot of time to hunt up the back numbers and mail them out. If our readers would renew a few weeks before their subscription expired it would save us much work and the readers would not miss a copy. We do not promise to always supply the back numbers when a renewal is not sent on time. We were expecting quite a number to be late with their renewals and had a large number of extras printed since the March 5 issue with which we can supply a limited number. A very large demand has been made for the April 5 "Barren Mare" issue.

There are two ways to keep a subscription list increasing; one is to furnish plenty of original, up-to-date, specially prepared material for the readers that they can not get anywhere else. This is our method of keeping our subscription list growing rapidly. The other plan is to give away a lot of premiums and continually send out notifications that their subscription has expired, with all kinds of offers. This is not our method. We notify our readers when their subscription will expire once and it is usually as convenient to renew at one time as it is another. By renewing at that time no issue will be missed.

The subscription price is fifty cents per year, or three years for one dollar until August 1; after that date the subscription price will be advanced. We will supply all the back numbers to March 5 while they last. Any who have renewed for one year can, by sending fifty cents additional, extend this subscription two more years in addition to the one that they have paid for—but we have no premiums to offer. Every issue of the American Breeder is worth fifty cents to any breeder, and especially to stallion and jack owners.

STALLIONS AND JACKS WANTED.

Owing to the severe winter and heavy snows there was not as much trading done last winter as common. A great many breeders who had intended to make changes in their operations, could not get away from home. Many breeders have written us that they have stallions which will need changing this year. Many changes could be made satisfactorily to all parties concerned if they knew where to make the change.

A one-inch advertisement in this paper will put the owner of such a stallion in communication with other breeders. Satisfactory changes of this kind are constantly being made. Frequently a breeder in an adjoining county may have just the kind of a horse that is wanted. When stallions are exchanged this way both parties can see the stallion in breeding condition and look at the colts, which will greatly help them in their future business.

This is an excellent time for breeders to advertise their stock, as every stallion and jack owner is reading this paper closely through the breeding season. Correspondence can be started with the understanding that the stock would not be for sale or exchange until the present breeding season is closed. We believe everyone who advertises breeding stock in this paper can find a buyer at a fair market value. There are a lot of breeders who do not understand the value of advertising; a great many of them sacrifice excellent animals because they do not know how to reach a customer.

In order to further increase the use of our advertising columns for this purpose we are going to cut the rate in two in the middle for the summer months. For these issues we will make a special rate of $1.40 an inch to all live stock advertisers. In writing an advertisement for one inch space you should not exceed about sixty words. This is sufficient to give a good description of a stallion or jack. The advertisement should be plain and written on a separate sheet of paper.

You will be interested in reading, on page 19 of this issue, the experience of others in the use of our advertising space.

MODERN HORSE BREEDING.

Several readers have stated that they wish to use the capsule system next year and ask us for the best method for getting their customers convinced that it is all right.

There is nothing that convinces men like having an opportunity to look at the genuine article. If these readers will use the capsule system on a few clean, healthy mares so that they will have some capsule colts coming next spring, there should be very little difficulty with the mare owners. This is an excellent opportunity to start the capsule system as there will be a rush to the stallion or jack on rainy days and Saturdays. If the operator will be careful about keeping his hands and instruments clean, and getting the semen from a clean, healthy mare, he should have little difficulty at this time of year, as the weather is warm and the tem-

perature will not be much below 95 degrees. All breeders should be careful about getting the water too hot, as it should never be above 101. This will give the operator practical experience so that in case the success is not as great as was anticipated, he could find out where the difficulty was.

The capsule system should be studied closely by every breeder. The time will come within a few years when nearly all of the breeders would like to know something about capsule breeding. Horse breeding is progressing rapidly and those who expect to remain in the business should make an effort to keep up to date.

There are a lot of mares bred every year through the entire season that never can get in foal with a natural service, that can be easily made producers by using the capsule system.

The Kansas City Impregnator Company is selling the Carlson Semen Extractor, one hundred pointed breeding capsules and one hot water thermometer (and paying the express) all for $5, until August 1, 1912. This company states that they are doing this to introduce the capsule system. It can also be noted from their advertisements that they sell the reliable breeding appliances for about half what other firms ask for the same goods. This firm manufactures the only pointed breeding capsule. These capsules can be purchased for about the same price as the old kind and are much more easily inserted. They have given excellent results.

When you buy breeding animals from our advertisers you are doubly helping in the improvement of farm stock.

EDUCATING MARE OWNERS.

No one can expect to have a good breeding district without having the mare owners educated. Many of our best producing mares are made barren from being served by stallions that have recently bred diseased mares. We will prepare a series of articles on breeding diseased mares, giving the results of the 1911 barren mare investigation. There are many old fogy notions about horse breeding that should be dispensed with. If a majority of the patrons of the stallion owners will read the American Breeder, think how much more pleasant the business would be. These patrons can read and learn much easier than a stallion or jack owner can talk to them. Furthermore, they are not always inclined to believe what a stallion or jack owner may say, as they frequently think that he is talking in his own interest.

With a few days of active work a stallion or jack owner should be able to send in from 20 to 50 subscriptions for the American Breeder. This is the only paper that completely covers the mare owners' education, and it is cheap in subscription price. It is very easy to get a mare owner to spend fifty cents for the American Breeder if he is properly solicited. The next few weeks is the best time to get these subscriptions, while the mare owners are coming to the barn. The stallion or jack owner that fails to get his mare owners on our list between now and August 1, will be the loser. After August 1, the subscription price will be advanced. Many of them can be induced now to subscribe for three years. Nearly all mare owners will be interested in a reasonable amount of material on beef cattle and hogs, in addition to the large amount of information they will receive about their mares. One of the greatest difficulties heretofore in getting mare owners to subscribe has been that they thought the American Breeder was printed exclusively for stallion and jack owners. Much better results can be obtained if the stallion and jack owner share this information with their mare owners and to educate them. The improvement in horse breeding conditions must come through education.

We may decide not to print mare owner editions during the winter months, as has been our custom. We believe that if stallion and jack owners will get busy they can make permanent readers of their mare owners. The time is short, as the first of August the subscription price will be advanced, then it will be more difficult to get the mare owners to subscribe. Nearly all of them can be easily interested by showing them a copy and telling them this is the only one you have and that you would not take a reasonable price for it. It is not necessary to hand out a lot of sample copies. Every stallion or jack owner should have enough influence among his customers to get these subscriptions without any difficulty.

CAPSULE BREEDING.

To the American Breeder:—Have started my third season with capsule breeding. It was a hard matter to start this way of breed; the first year only a few of the mare owners allowing me to capsule their mares. Last season I capsuled twice as many and this year the mare owners are calling for the capsule system. I got 75 per cent of all mares bred with capsules in foal. One mare was bred three times with the horse, and at her next heat period I used a capsule and she is now safe in foal. Another mare was 17 years old; had her last colt when she was 12 years old and had been bred every year since all season long without getting in foal. The owner of this mare told me her history and asked me if I could capsule her. I did and got her in foal. She has a fine colt by her side now. Capsule breeding is profitable to mare owners, as the above illustration shows.—E. D. Ellsworth, Grant county, Wisconsin.

FROM AN OLD TIMER.

To the American Breeder:—Will do all I can for your paper; think it is the best. We have an imported black Percheron, also imported Majorica jack and five young jacks. Am 74 years old; handled stallions since I was 18 years of age and find good, common, practical sense and information in every number. Will try and get all our patrons to take the American Breeder.—Frank Leach, Mesa county, Colorado.

LIKES NEW POINT PROTECTOR.
